

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

FOR WORLD

The *Spinning*
ELECTRIC Double Deck DISCO

THE WINTER NEED IN STARTERS

Thousands of motorists have had experience with starting devices that **crank** a car. They know that, in many cases, especially in winter, mere cranking is not sufficient. They have had the experience of climbing out and doing the necessary spinning themselves. So thousands are now looking for the starter that makes the motor **spin every time.**

That starter is The **Spinning Electric** Double-Deck DISCO Starter **which we furnish for 6 or 12 volts.** And, with all its advantages, the Electric Disco is the simplest electric starter built.

Not a Make-Shift

The Disco is a two-unit system of double-deck design. It is not a left-over lighting generator re-made into a, so-called, electric starter.

The Electric Disco needs no frequent re-charging of batteries. It is specially **designed** and **built** to start **and** light a car. It supplies enough current to keep the battery always fully charged and ready to immediately start any motor in any kind of weather.

Great Advantage to Manufacturers—Disco ONE-POINT Connection

The new Electric Double-Deck Disco is attached to the motor with a single connection. This saves time for manufacturers and eliminates all possible trouble that complication means to car owners. Why use two units separately when one compact two-unit starter attaches as simply as this?

Speed, Dependability, LESS CURRENT

Though the Electric Disco **spins** a motor 150 R. P. M. it uses less current in starting a car than any slow-turning starter. That's because **spinning** starts motors **more quickly.** We may use more current per second, but the Disco works many seconds less. The batteries of six Disco-equipped cars each of which had run 25,000 miles were recently tested and found to be fully charged and in absolutely perfect condition. These starters had averaged 150 R. P. M. and never missed a start!

The World's Finest Starter – Read the Book

Complete description and illustration of the **Spinning Electric** Double-Deck Disco are given in our latest book on electric starters. We send it free to manufacturers, motorists and dealers. Write for a copy—a post card will do.

The power in an automobile depends upon the parts which transmit the energy to the wheels. It is therefore essential that the ball bearings above everything else be of proper design and of superior quality.

For this reason the worth of a car may be determined by the Quality and Make of the ball bearings. R. I. V. are Trade Winners.

NYBERG SAYS RECEIVERS ARE DUE TO "ACCOUNT CHASERS"

Claims Sordid Activities of Collection Lawyers Caused His Embarrassment — Two Receivers But Proprietor is Hopeful.

Due, it is declared by Henry Nyberg, to the action of local attorneys seeking collection business, the Nyberg Auto Works, of Anderson, Ind., of which he is proprietor, on Monday last, 22nd inst., was placed in the hands of Senator Frederick Vannuys, as receiver, by Judge Austill, of the Indiana Superior Court. The petition for the receiver was filed by the National Exchange Bank of Anderson.

The following day (Tuesday), other creditors took similar action, but instead of resorting to the state court they applied to the United States District Court, which, in the person of Judge Anderson, named John C. Teegarden as receiver for Nyberg operating as the Nyberg Auto Works. This petition was filed by the B. & B. Mfg. Co., of Cleveland, Apple Electric Co., of Dayton, and Gibson Automobile Co., of Anderson.

Sympathy in Anderson is generally in favor of Nyberg and strongly against the attorneys whose tactics contributed to his trouble. In an effort to obtain clients, they are said to have written letters which so affected the credit of Nyberg that he has been forced to pay cash for material and thereby greatly embarrassed. He, however, hopes to continue the business, as the physical value of the plant is between $150,000 and $200,000, and the liabilities approximate $90,000 to $100,000. Carl Lemcke, Nyberg's manager, states that the plant has always been operated at a profit, despite the heavy losses sustained in the floods last March, when the Nyberg factory was inundated.

Nyberg, who then was in the automobile business in Chicago, acquired the property about two years ago, and later established a branch plant in Chattanooga, which recently has been undergoing reorganization of some sort.

Goodyear Repudiates Rumors of Merger.

Reports that the United States Rubber Co., owner of the United States Tire Co., had acquired or is negotiating for the control of the Goodyear Tire & Rubber Co., of Akron, are emphatically denied by President Seiberling, of the latter company. Similar rumors were in circulation once before, but the present crop is attributed to the utterances of an Eastern tire man of some prominence.

Tariff Likely to Affect Tire Prices.

It is expected that the Underwood tariff bill will be enacted early next week and be promptly signed by President Wilson. It is known that the reduced duties which it provides will result in the introduction of a $1,500 French car, but the most immediate effect probably will be a readjustment of prices on tires, the duty on which will be cut from 35 to 10 per cent.

Ford Reaching into South America.

Having decided to reach out for South American trade, as it reaches out for trade in other parts of the world, the Ford Motor Co. is making ready to establish a branch and service station in Buenos Aires. It will be in charge of E. H. Hampton, who has been the Ford export manager.

Maxwell Forms a Canadian Company.

The Maxwell Motor Car Co. of Canada, Ltd., with its principal office at Windsor, Ont., has been incorporated under the laws of the Dominion with an authorized capital of $10,000. W. E. Flanders, Walter M. Anthony and Ernest Edward von Rosen figure as the corporators.

Warren Creditors Receive 10 per Cent.

The receiver of the Warren Motor Car Co., of Detroit, has declared a dividend of 10 per cent. The amount, aggregating $50,000, is now being disbursed.

HOUK ACQUIRES CONTROL OF McCUE AND CHANGES NAME

Rival Wire Wheel Makers Unexpectedly Get Together—Houk's Patent Rights Prove of Potent Influence in Transaction.

What is unquestionably one of the most far-reaching deals that has taken place in the automobile trade during recent years was consummated on Tuesday last, when a controlling interest in the McCue Co. of Buffalo was sold to George W. Houk, of Philadelphia. Immediately upon acquiring control Houk instituted a reorganization and the new company thus reorganized and refinanced became the Houk Wire Wheel Co.

The reorganization means chiefly two things: First, that the Houk Wire Wheel Co. will continue to produce the Houk wheel (the successor to the original McCue wheel) under the patents originally granted to the Rudge-Whitworth Company of England, the rights to operate under which in America are held by Houk; second, that additional capital has been put into the old company to enable it to still further increase its facilities, to take care of the extremely rapidly growing demand for wire wheels.

The reorganization, however, in no way affects either the personnel of the directors and stockholders of the only recently reorganized McCue Co., nor the active management thereof. It simply places Houk in and carries with it all the rights and patents controlled by him in this country, without which rights it was conceded by the old organization it would be impossible to produce wire wheels of practical commercial value.

The underlying cause of the deal just completed is Houk's control of basic patents, and particularly those covering the principle of triple spoke lacing and the use of an absolutely automatic locking de-

Digitized by Google

vice for detachable wheels. When the present managers of the McCue Co. assumed charge last April they were very quickly impressed by the fact that no matter how perfect a locking device might be, if it were other than positively automatic it was not fool-proof, and was therefore impractical and uncommercial. No matter how simple the adjusting device might be, it is almost inevitable that the majority of persons both in the trade and out of it would fail to adjust such devices, as it was intended to be adjusted. Together with his engineers, W. F. Evans, general manager of the McCue Co., set about the task of overcoming this feature, and as a result the present efficient automatic locking device was worked out. But when finally it was completed it was discovered that the device infringed the patents under which Houk was protected in this country.

The sweeping decision recently handed down in the British courts sustaining the Rudge-Whitworth patents, together with the exhaustive research made by the McCue management, made it very evident that license under the Rudge-Whitworth patents was necessary if McCue intended to continue to manufacture a wire wheel that could be commercially guaranteed.

At the same time, Houk was facing a situation in the production of Rudge-Whitworth wire wheels that made it advisable for him to obtain an additional source of supply equal to several times his present capacity, the insistent demand for wire wheels making it utterly impossible for him to supply that demand for Rudge-Whitworth wire wheels with the facilities at his command.

Negotiations therefore were commenced and have been in progress for several months, for a license arrangement. Meanwhile the McCue Co. holdings were being augmented largely and the capacity increased, and as the result of a thorough investigation of the merits of the McCue holdings, coupled with a careful testing out of their late product, which is hereafter to be known as the Houk wheel, the two interests reached the agreement just consummated in the organization of the Houk Wire Wheel Co., which is entirely separate and apart in every detail both as to holdings and manufacturing from Houk's Rudge-Whitworth enterprise in Philadelphia.

The volume of wire wheel business recently placed by a number of leading automobile manufacturers is remarkable, considering the comparatively recent acceptance of the wire wheel by the buying public in this country, and a large part of this business being tentative upon the clearing of the situation both as regards volume and infringement, the plans consummated yesterday will clear the situation."

HENDERSON GETS INTO HOT WATER BUT QUICKLY ESCAPES

Insistent Creditor Applies for Receiver But Is Promptly Satisfied—Action Serves to Settle Internal Differences.

Internal differences led the Henderson Motor Car Co., of Indianapolis, into hot water late last week, but quick action pulled it out before any considerable damage had been done.

The hot water consisted of an application for a receiver, filed by A. M. Hall, of Indianapolis, whose claim amounted to $1,500. Payment of the amount, it is explained, had been delayed largely because two factions within the Henderson company were fighting for its control. Hall, however, was not interested in the squabble. He wanted his money and immediately he took legal action he got it, and as promptly withdrew the suit.

The proceedings, however, had the effect of bringing the Henderson factions to a realization of the danger which confronted them and, accordingly, they quickly settled their differences by admitting to the board of directors Franklin Bonegut, Arthur R. Baxter and A. R. Smith, all prominent Indianapolis men, who represent new interests controlling approximately $200,000 of the company's added capital.

It is also authoritatively announced that, now that peace reigns, a popular priced Henderson car, using a kerosene carburetter, probably will be added to the line.

Atlanta Dealer is Awarded Verdict.

A verdict of $1,569.50 was returned last week in favor of the Roden Automobile Co., of Atlanta, Ga., in an action brought against the Overland Southern Co. for alleged breach of contract; the Roden company claimed it contracted October 21, 1909, with the Overland Southern Co. to sell Overlands in certain Alabama counties, that it deposited $2,500 as required, that the company refused to return $1,300 of this amount and also refused to pay a freight claim of $134.44. The verdict included interest.

Son Succeeds Father in Smith Company.

To fill the vacancy caused by the death of A. O. Smith, the directors of the A. O. Smith Co., of Milwaukee, at their annual meeting on Friday last, elected his son, L. R. Smith, president and general manager of the corporation. The other officers chosen are as follows: C. S. Smith, vice-president; E. M. Smith, secretary; James L. Sinyard, assistant secretary and sales manager; Joseph J. Stamm, assistant treasurer. The board of directors is made up of the three Smiths, Sinyard and John P. Kelley. The new president has been associated with the Smith company since its organization and has let it be known that he will continue the policies of his father which led to the present growth and prestige of the business.

Two Stearns Branches Incorporated.

To facilitate matters, the F. B. Stearns Co., of Cleveland, has transformed its branches in Philadelphia and Los Angeles into corporations. The former will be known as the F. B. Stearns Co. of Philadelphia, and the latter as the F. B. Stearns Co. of California. Previously the California branch was located at San Francisco, but it has now been transferred to Los Angeles, where J. H. McDuffee will continue in charge. S. N. Bourne will also remain manager of the Philadelphia establishment.

Cole Registers "The Standardized Car."

Due to opportunity afforded by an Indiana State law, the Cole Motor Car Co., of Indianapolis, has registered the term, "The Standardized Car," which it believes will be sufficient practically to assure the right thereto in all parts of the country. As the Federal regulations will not permit the copyrighting of such descriptive terms, until the Cole people found the necessary State law it was not thought that anyone could lay claim to even limited legal right to descriptives of the sort.

Factory for Cameron Wire Wheel.

The Cameron Wire Wheel Co., recently formed in Detroit, has taken possession of a plant at 47 Adelaide street and has commenced the production of wire wheels in earnest. Its officers are F. F. Cameron, president; W. E. Carpenter, vice-president; M. O. Crawford, secretary and treasurer; A. A. Leslie, general manager.

British Patents Issued on Sparton Horn.

Broad patents covering the Sparton electric horn have just been issued in England to the Sparks-Withington Co., of Jackson, Mich. Patents are also pending in all of the other principal European countries in which it is the intention of the Sparton manufacturers to push their horn.

Goodrich President Back from Europe.

B. G. Work, president of the B. F. Goodrich Co., was among those who returned from abroad last week on the Imperator. While abroad he visited the Goodrich factory in Paris, the output of which, he states, while comparatively small, has been sufficient to earn a "decent profit."

HITCH DEVELOPS IN SALE OF FLECHTER CARBURETTER

Anderson, Inventor, Fails to Assign Patent to Trenton Company Which Bought Flechter Business—Court Order is Sought.

William K. Anderson is a subject of the King of Denmark. He also is the ex-inventor for L. V. Flechter & Co., carburetter makers, and just now he is a thorn in the flesh of the Flechter company and the Trenton (N. J.) Brass & Machine Co., to whom Flechter sold out last spring; as a part of the transaction, he asked Anderson to assign his rights in the Flechter patent to the Trenton company. Flechter sent him an assignment blank and since April 7, the day of the sale of the Flechter company, the Trenton Brass concern has been regularly mailing assignment blanks to Anderson. What he has done with them, unless he is keeping them as souvenirs, does not appear, but according to a suit filed this week in the United States District Court for the Southern District of New York, he has failed to fill out and return any of them. Until he does so, the title to the patent naturally seems clouded and the suit is evidently designed to lift the cloud.

According to the complaint in the action instituted against Anderson by the Trenton company, the former made a contract with the Flechter company August 5, 1910, whereby he assigned to the company all his past and future rights in any patents he had gotten out or might get out for the Flechter locomotive type of carburetter. The consideration was ten shares of stock of the par value of $100 each which he was permitted to buy for $250.

Anderson made certain inventions and improvements, at the Flechter expense, it is stated, all of which resulted in the issuance of patent No. 1,041,708 October 15, 1912. The patent was in Anderson's name, of course, and it was supposed he would turn all of his rights over to the company which employed him. While the Flechter company operated by itself things apparently worked smoothly, but when the Trenton company bought it and prepared to enlarge the production of the carburetter the hitch came. According to the terms of the sale, the Trenton Brass company took over the entire Flechter business and Flechter himself went with the company to assist in the sales work.

Demands for an assignment to the Trenton company were made, but not complied with. The Trenton company asks that Anderson be enjoined from assigning or in any way encumbering the patent during the pendency of the suit and asks that another order be issued compelling him to assign, and that in case he refuses a trustee be appointed to do the assigning for him.

Sues Manufacturer for Broken Sector.

Claiming that a defective steering sector in a Lozier car broke, caused the car to overturn July 2 last and broke two of the ribs of Mrs. Viola Roth, wife of Charles Roth, of New York City, the latter have filed suits in the Supreme Court for New York county against the Lozier Motor Co., of Detroit. She asks $50,000 for her injuries and her husband demands $10,000 for the loss of his wife's services and for medical expenses. They allege that the car had been inspected and pronounced in good order by the Lozier dealer in New York shortly before the time of the accident, and that it was being operated by a skilled chauffeur when the sector broke.

Newtone Makers Produce Mechanical Horn.

While it will continue its motor-driven Newtone horn, the Automobile Supply Mfg. Co., of Brooklyn, has departed radically from its previous practice by placing on the market a mechanical horn, styled the "Motophone," which is heralded as "superior to any motor driven horn or any other device of the class." The "Motophone," which lists at $12, is, of course, operated by merely touching a lever.

Figures Showing Firestone's Big Business.

According to its annual report for the fiscal year which ended July 31st last, the gross earnings of the Firestone Tire & Rubber Co., of Akron, amounted to $15,000,000, in round figures, as compared with $11,500,000 for the preceding year. The net profits were $1,600,000 and the surplus for the year $1,250,000. The balance sheet shows current assets of approximately $7,000,000.

Page to go Largely into Windshields.

E. K. Conover, of New York, who has invented a number of automobile accessories, has joined the Page Fence Co., of Adrian, Mich., and will develop the windshield department of that concern. One of his shields has been made in a small way for a few years by the Fence company, but it is the immediate intention to greatly enlarge the department.

Edmond Acquires Feps Representation.

Having discontinued its New York branch, the Schoen-Jackson Co., of Media, Pa., maker of Feps carburetters, has appointed the E. J. Edmond Co., 1783 Broadway, its general sales agent for the metropolitan territory. The latter will carry a full stock of Feps carburetters and have facilities for installation and adjustment.

UNCOVER "VELVET" PAYROLL FOR MICHIGAN'S OFFICIALS

More Amazing Discoveries in Bankrupt's Affairs—Four Men Draw Big Sums "on the Side"—Assets Shrink.

Judicial investigation of the affairs of the Michigan Buggy Co., of Kalamazoo, Mich., which owned and operated the Michigan Motor Car Co., has disclosed even more remarkable financing than was indicated in Motor World's exclusive story of August 14th. At that time, it was shown how the company kept itself afloat not only by taking and immediately discounting its dealers' notes for the entire amounts of their orders—in at least one instance, in excess of $375,000—but by presenting statements to banks that showed no "Bills Payable," the latter not appearing on the company's books but being carried in file indexes.

At the time of the failure, August 6th, ugly rumors were afloat in Kalamazoo and unpleasant charges were leveled at Victor L. Palmer, secretary-treasurer and general manager of the Michigan company, the belief at that time being that the owners of the property, Frank B. Lay and his two sons, George and Frank B., Jr., had been more sinned against than sinning. Formal investigation which, at the instance of the receiver, the Detroit Trust Co., has been conducted during the past week by John Banyon, the referee in bankruptcy, has, however, served to indicate that the Messrs. Lay did not lack culpability.

The most sensational development brought out by the referee concerns the existence of what is termed a "velvet" payroll, maintained, apparently, for the benefit of Palmer and the Lays. According to the testimony, it was carried on the company's books in the name of J. Roach & Co., which is said to be a purely mythical firm, to whom the checks were drawn in a lump sum and the money later divided among the responsible parties. Of the "velvet," Frank B. Lay, president, drew $35,000 a year, while his two sons and Palmer received $25,000 each. Palmer's regular salary was $300 per month.

The receiver's report, which just has been issued to the creditors, shows that the Michigan Buggy Co.'s total assets, valued at $2,782,033.44, have been appraised at only $1,261,387.92. The liabilities total $2,528,723.07, but there are additional contingent liabilities of $422,287.45, made up of endorsements of discounted notes, $321,191.98 and drafts discounted with bills of lading for cars attached, $101,095.47.

In its letter presenting these figures to

Digitized by Google

the creditors, the receiver hints at the remarkable condition of affairs in the following language:

"It is perhaps proper to call attention in this connection to the fact that in view of the company's rather peculiar and incomplete method of accounting, the absence of complete cost or inventory data, and the volume and varied nature of its financial transactions, the compiling of such a statement of the assets and liabilities has been rather an unusual and difficult task. Verification of accounts has been requested from all creditors' and debtors' records, but we have been only partially successful in securing answers which we may use as a basis for reconciling accounts, so it may be considered unlikely that all claims that will eventually be proven have so far come to our notice.

"In preparing the statement of assets and liabilities there has arisen a difficult question in reference to the so-called dealers' deposit notes given by certain of the company's automobile dealers in accordance with the terms of their contract, a large number of which notes have been discounted and are at present held by the banks, also the value of the cars on hand at the time of our appointment or which had not been settled for which had been shipped under the terms of the contract with the dealer.

"There has been no judicial decision as to the liability of the company or the dealers on these deposit notes or the present ownership of the cars, but in view of the opinion of our counsel, we have, in compiling the statement, worked under the assumption that the value of these cars should be shown as an asset, as they will be applied later in the discharge of either general or specific indebtedness of the company. We have also assumed that many of the notes under discount would prove to be, in any event, a direct obligation of the company, provable as claims by their holders, and they have accordingly been listed, and the residue of the company's notes receivable under discount shown as a contingent liability."

Cyclecar Project for Minneapolis, Too.

The Continental Engine Mfg. Co., which has done business in Chicago and Dallas City, Ill., is removing to Minneapolis, where it will produce a cyclecar listing at $385. It has acquired a plant on 14th avenue S. E. and the Northern Pacific Railroad. The prime movers in the affair are J. E. Pfeffer and T. H. Mars, of Chicago, and L. C. Erbs, of Minneapolis. In addition to the cyclecar, it is probable that the company will also produce a few full grown automobiles which will be known under the name Bull Moose.

BENNETT IS LAID AT REST; WILLYS'S GRACEFUL TRIBUTE

Funeral of Overland's Departed Manager Devoid of Display, as he Requested—Physicians Explain Cause of Death.

In accordance with his last wishes, the funeral of George W. Bennett, vice-president and general manager of the Willys-Overland Co., which occurred in Toledo Saturday afternoon last, was of a strictly private character, attended only by his most personal friends and business intimates. It was his expressed desire that there be neither crepe nor flowers. His body was temporarily placed in the Toledo Mausoleum, or receiving vault.

Among those in attendance were Charles T. Jeffery and W. J. Cavanaugh, representing the Thomas B. Jeffery Co., of Kenosha, Wis., Bennett having spent some 20 years in the service of the late head of that company.

His successor in the Willys-Overland organization has not yet been chosen. For the time being, the duties will be shared by C. S. Jameson, his former chief assistant, and Treasurer Stewart.

As stated in last week's Motor World, the death of no man identified with the industry ever caused a more widespread shock. Bennett was of such powerful build, and so like the picture of health, that none was prepared for news of his death. Circulation of reports that he had succumbed to the effects of a second operation led the doctors in attendance to issue a formal explanation. They state that the first symptoms of appendicitis, recurring attacks of which Bennett had suffered for years, appeared the Thursday previous to his death. He was operated on once only, and in Toledo within 20 hours thereof, at which time it was found that his appendix was in a leaking condition, causing a virulent infection leading to acute peritonitis, which caused his death Wednesday afternoon, 17th inst.

Apart from his handsome earnings during the last three years, Bennett left a comfortable fortune in life insurance, most of which has been recently taken out.

In paying a tribute to his late lieutenant, John N. Willys describes Bennett as a "man who, like but few others, understood the power of organization—a practical apostle of genuine team work in the world of commerce." "The finest monument that can be erected to his memory," adds Willys, "is that which he himself built during his lifetime—a distributing organization, unequalled in the world, which typified his far-reaching conception of the superiority of perfect business organization."

Burglars Visit St. Louis Supply Store.

Yeggmen paid a visit last week to the automobile supply store of Bart S. Adams, at 3408 Lindell boulevard, St. Louis, Mo. They bored 35 augur holes in the floor to remove a section of it and gained entrance to the store, taking $5.40 from the cash drawer. Inasmuch as soap for making a "soup" cup was found, it is believed the intruders contemplated "blowing" the safe but were frightened away before doing so.

Demands $2,700 for Ford Car Parts.

A bill of $2,716.91 for Ford parts is the basis of a suit filed this week in the Supreme Court for New York county against the Simmons Automobile Co., of 2138 Westchester avenue, by Phillip Goettel; Goettel trades as the Bronx Ford Co., at 415 East 149th street, and claims that the parts were supplied between April 1 and August 1, 1913.

Nova Scotia Decides to Expand.

The Nova Scotia Carriage & Motor Car Co., Ltd., of Amherst, N. S., has finally decided to complete its new plant, the erection of which was commenced in that city. When it is finished the property in Kentville, where operations were inaugurated, will be removed to the Amherst factory.

Lumsden Here for Short Visit.

Arthur E. Lumsden, manager of the B. F. Goodrich Co.'s factory in France, is in this country for a brief visit. Lumsden, a former Chicagoan, was for many years in charge of the Goodrich London depot before being promoted to the management of the French factory.

Mack Branch Opened in Springfield.

The Mack Motor Truck Co., a Massachusetts corporation which distributes the International Motor Co.'s trucks in New England, has opened a branch at 88 Birnie avenue, in Springfield. It is in charge of E. N. Wright.

Stocker Acquires Plant for Galen's Pump.

The Stocker Mfg. Co., recently organized in Detroit, has leased manufacturing facilities at 61 Fort street east. It will manufacture a double-action automobile pump patented by Robert Galen, secretary of the company.

Gibney to Open Branch in Boston.

The Gibney Tire & Rubber Co., of New York and Philadelphia, is preparing to establish a branch in Boston; it will be located on Brookline street, near Beacon street.

The Week's Incorporations

Coloma, Mich.—Coloma Auto Sales Co., under Michigan laws; authorized capital, $5,000.

Stoneville, N. C.—Carolina Motor Co., under North Carolina laws; authorized capital, $5,000. Corporators—J. M. Deaton and others.

Morristown, N. J.—Motor Transportation Co., under New Jersey laws; authorized capital, $20,000; to operate a motor transit line.

Pontiac, Mich.—Pontiac Motor Car Co., under Michigan laws; authorized capital, $25,000. Corporators—I. A. Morrison, C. F. Taylor, E. Hoobler.

San Antonio, Tex.—Texas Motor Truck Co., under Texas laws; authorized capital, $10,000. Corporators—William H. Smith, Marvin Trice, S. Burg.

Davenport, Ia.—Zip Cyclecar Co., under Iowa laws; authorized capital, $25,000. Corporators—G. Decker French, Frank W. Skinner, R. W. Phelps.

Detroit, Mich.—Dodge Motor Co., under Michigan laws; authorized capital, $15,000. Corporators—Alvah M. Dodge, J. Major Lemon, Jonas H. Kirby.

Detroit, Mich.—Flyer Motor Car Co., under Michigan laws; authorized capital, $100,000. Corporators—G. A. Milne, Alwin A. Gloetzner, Henry W. Campbell.

Pittsburgh, Pa.—Motor Square Garden Amusement Co., under Delaware laws; authorized capital, $15,000; to manufacture and deal in motor cars and accessories.

Chicago, Ill.—Paul Wargny & Co., under Illinois laws; authorized capital, $2,500; to deal in motor cars. Corporators—Gustav Mueller, Paul Wargny, Sidney B. Meyer.

Chicago, Ill.—Ross Sleeve Motor Co., under Illinois laws; authorized capital, $20,000; to deal in motors and engines. Corporators—F. W. Lull, E. Lundblad, A. S. Lytton.

Providence, R. I.—Goodwin-Sherman Motor Co., under Rhode Island laws; authorized capital, $25,000. Corporators—Charles Goodwin, Charles A. Sherman, William Ford.

Salem, Mass.—Loring Avenue Garage, under Massachusetts laws; authorized capital, $5,000; to operate a garage. Corporators—George H. Brooks, George P. Brooks, Ashley R. Slee.

Texarkana, Tex.—Motor Mart, under Texas laws; authorized capital, $5,000; to conduct a general motor vehicle business. Corporators—J. E. McCullough, R. P. Wilson, J. C. Watts.

Detroit, Mich.—Jeffery-Dewitt Co., under Maine laws; authorized capital, $500,000; to manufacture, sell and deal in automobile parts and accessories. Corporators—E. M. Leavitt and others.

Chicago, Ill.—Trumbly Co., under Illinois laws; authorized capital, $10,000; to deal in motor cars and conduct a repair shop. Corporators—M. J. Woodhull, J. G. Trumbly, R. B. Lacey.

Bridgeport, Conn.—Moon Motor Sales Co., under Connecticut laws; authorized capital, $15,000; to deal in motor cars. Corporators—Barnith Sachs, Henry H. Drucker, Samuel B. Drucker.

Indianapolis, Ind.—C. A. Chambers Co., under Indiana laws; authorized capital, $5,000; to deal in motor cars, trucks, plows, etc. Corporators—C. A. Chambers, L. M. Chambers, A. L. Caterlin.

Port Jefferson, N. Y.—Metco Motor Car Co., under New York laws; authorized capital, $5,000. Corporators—E. Hollis, L. A. Sorenson and E. C. Hebereft, all of 140 Nassau street, New York.

Cleveland, Ohio—Metropolitan Garage Co., under Ohio laws; authorized capital, $5,000; to operate a garage. Corporators—C. Mulcahy, N. C. Quigley, Harry Loeb, W. I. Quigley, Marie Schwab.

Hempstead, N. Y.—G. B. Garage & Mfg. Co., under New York laws; authorized capital, $50,000. Corporators—Samuel G. Sammis, Lewis B. Haff and Reginald L. Vandewater, all of Hempstead.

Chicago, Ill.—L. Markle Co., under Illinois laws; authorized capital, $40,000; to deal in motor vehicles, parts and accessories. Corporators—Emil C. Wetten, Jasper E. Rommell, Harvey M. Doyle.

Indianapolis, Ind.—Redkey Garage, under Indiana laws; authorized capital, $10,000; to buy, sell and deal in motor cars and operate a garage. Corporators—David Cook, Harry Aukerman, Austin H. Williamson.

Wilmington, Del.—United States Pneumatic Rim & Tire Co., under Delaware laws; authorized capital, $1,000,000; to purchase from the Pneumatic Rim & Tire Co. all patents, especially the "Chippey Patent."

Chicago, Ill.—Automobile Realization Co., under Illinois laws; authorized capital, $90,000; to deal in motor cars, parts and accessories. Corporators—Frank T. Righeimer, Mark W. Bigelow, Frank T. Murray.

Hempstead, N. Y.—London Limousine Co., under New York laws; authorized capital, $10,000; to manufacture automobile bodies. Corporators—John A. McAvoy, Charles U. Stowe, and Anna M. Stowe, all of Hempstead.

New Rochelle, N. Y.—Huguenot Motor Corporation, under New York laws; authorized capital, $3,000; to manufacture motors, etc. Corporators—Sidney H. Kent, Albert D. Stubblebine and F. A. Stubblebine, all of New Rochelle.

Herkimer, N. Y.—Garage Co. of Herkimer, under New York laws; authorized capital, $5,000. Corporators—Charles O. Terwilliger and Josephine B. Terwilliger, both of Prospect street; Newton Foss Hand, 102 West street, Utica.

Auburn, N. Y.—Ten Eyck Pump Co., under New York laws; authorized capital, $5,000; to manufacture air pumps, automobile starters, etc. Corporators—Frank E. Ten Eyck, John C. Glaum, Jr., Maud E. Ten Eyck, all of Auburn.

New York, N. Y.—Harroun Carburetter Co., under New York laws; authorized capital, $25,000; to manufacture automobile parts. Corporators—Victor Kliesrath, Walter F. Blaisdell and R. Burchard Hultz, all of Port Washington.

Duluth, Minn.—Resilient Auto Wheels Co., under Minnesota laws; authorized capital, $50,000; to manufacture resilient automatic wheels. Corporators—Arthur Jutila, Helmer Johnson, Osmund Thompson, A. W. Youngkvist, B. E. Wellberg.

New York, N. Y.—Bellamore Toomey Co., under New York laws; authorized capital, $30,000; to deal in motor cars, etc. Corporators—Thomas H. Toomey, 3920 Broadway; David G. Bellamore and David H. Bellamore, both of 29 Clairmont avenue.

Brooklyn, N. Y.—Ritz Cycle Car Co., under New York laws; authorized capital, $10,000; to manufacture motor cars, cyclecars, motorcycles, etc. Corporators—Albert T. Maurice, A. Spotswood Campbell and Daniel R. Murray, all of 54 Wall street.

EXPORT OF CARS INCREASED $33,616 IN MONTH OF JULY

Eleven Geographic Divisions Record Gains—Pleasure Cars Advance 10 Per Cent. in Number—Tires and Engines Lose.

Of the twelve geographic divisions into which foreign countries are divided for export purposes eleven during the month of July gained over the same month of the preceding year, and the total volume of cars, parts, engines and tires reached the sum of $2,543,919; cars alone for the compared months of July gained $33,616 in that month of the present year, which is an advance of 2 per cent. The gain in number of cars was 129, or 8 per cent.

Since pleasure and commercial cars were not separately listed prior to July 1, 1912, it is possible now for the first time to compare the separate exports of these two types of vehicles. Pleasure vehicles gained 163 in number, or 10 per cent., and $86,462 in value, or 5 per cent., and the average value in July of this year was $949. In July, 1912, the average value was $993, which gives to the later July a loss of $44, or 4 per cent. Trucks, taken by themselves, are entered in the loss column, the figures decreasing by 34, or 43 per cent., in number and $52,846, or 33 per cent., in value. Also the average values were: July, 1912, $2,005; July, 1913, $2,127; a gain of $122, or 6 per cent. Parts increased in value by $554, less than 1 per cent.

As regards the geographic divisions, the most noteworthy achievement was that of Germany, which took 110 more cars than it did in July, 1912, an advance of 500 per cent. In value this nation increased its American purchases by $77,232, or 365 per cent. Next in percentage of increase is Other Countries, which added 112 cars to the number it bought in July of last year, a gain of 260 per cent., and increased the value of its purchases by $91,413, or 116 per cent. Mexico apparently is recovering from some of the losses which accompanied its internal disturbance and advanced its total of cars by 21, or 233 per cent., and by $24,804, or 170 per cent.

The West Indies and Bermuda continued to prove a market for American cars, increasing their takings by 22 cars, or 169 per cent., and by $21,004, or 172 per cent. British Oceania, which for some time has imitated the United Kingdom in decreasing its American purchases, is this time registered in the column of gains, having taken 68 more cars, or 32 per cent., with an increased valuation of $56,700, or 31 per cent. South America's advance was 42 cars, or 23 per cent., and $48,746, or 24 per cent.

The United Kingdom did not entirely succeed, as it has several times, in showing a loss, for while it took 45 cars, or 13 per cent. less, its valuation gained $1,868, a slight percentage. Canada received 255, or 55 per cent., less cars with a decreased valuation of $338,715, or 49 per cent.

Although the number of engines exported was 405, or 80 per cent., less in July, for the first seven months of 1913 this product gained by 1,968, or 34 per cent. The value, too, in July fell off by $32,491, or 49 per cent., but in the seven-month period advanced by $558,820, or 87 per cent. Tires lost by $10,963, or 2 per cent., in July, but in the seven-month period gained by $710,124, or 38 per cent. Cars for the seven months gained 1,695, or 11 per cent., in number and $2,352,561, or 15 per cent., in value and the total for all products recorded an increase of $4,248,529, or 20 per cent., for this first part of the present year. The details are shown by the subjoined table.

JULY AUTOMOBILE IMPORTS DECLINE IN VALUE BY 47%

Loss Is $73,573 and Represents 27 Cars—France and Italy Lead Losers With 64 and 38 Per Cent.—England Gains.

The foreign purchases of automobiles by America during the month of July just passed decreased in value by $73,573, or 47 per cent., the importation maintaining the downward tendency which has marked it during recent months; but one country made any sort of gain in its shipments to America, and that was the United Kingdom, which sent cars valued at $3,007, or 34 per cent., more than it did in July, 1912. The number of cars, however, was 2 less, a loss of 40 per cent.

The heaviest loser was France, whose sales in this country declined by 20 cars, or 55 per cent., and by $61,348, or 64 per cent. Germany broke even so far as number is concerned, but in valuation its figures shrank by $4,183, or 23 per cent. Italy's shipments were less by 3 cars, or 50 per cent., and by $4,280, or 38 per cent. The total number of cars was less by 27, or 42 per cent. Parts lost by $500, or 3 per cent. For seven months ending July 31 cars lost 147, or 31 per cent., in number and $313,780, or 29 per cent., in value. The average value was $2,207 in 1913 and $2,425 in 1912. The figures follow:

	July 1912 No.	July 1912 Values.	July 1913 No.	July 1913 Values.
France	36	$95,433	16	$34,085

In the RETAIL WORLD

John Flesher, of Morgan Hill, Cal,. is building a garage.

Walter Philips, of Canton, Ill., proposes to erect a new garage.

Parkhurst & Lavender, of Webster City, Ia., plan to build a new garage.

Frank T. Hutchinson, of Superior, Wis., has taken over the Carey Garage.

Henry & Herman is the style of a new garage business in West Brooklyn, Ill.

F. W. Moore, of Floresville, Tex., is building a new garage and salesrooms, 40 x 70 feet.

H. A. De Raismas, of Elizabeth, N. J., will build a new garage at 250 Union street; it will cost $6,700.

The Cadillac Sales Co., of Fort Dodge, Ia., has completed a new garage; it is locatetd on 1st street.

The W. G. Hirsig Co. has opened new salesrooms in Nashville, Tenn. They are located in the Plater building.

M. A. Christenson, of Stanley, Wis., has sold his garage to George Ehlander; the latter will enlarge the building.

John D. Schaal. proprietor of a garage and machine-shop in Chambersburg, Pa., is about to erect a new building.

E. D. Rubel, of Santa Maria, Cal., has taken over the garage and agency of A. L. Smith; he handled the Cadillac.

J. Krick, of Los Angeles, purposes erecting a garage at 279 West 7th street; it will represent an expenditure of $3,500.

Nehemiah Jennings, of Southport, Conn., plans to build a garage, 40 x 60 feet; he is also the proprietor of a meat market.

Noyes A. Alling, of Bridgeport, Conn., has been granted authority to erect a garage; it will stand on Clinton avenue.

The Mar Vista Co., of Pasadena, Cal., will build a garage at 114-20 South Los Robles avenue; the cost will be $7,000.

Belgard & Jackson, of Los Angeles, plan to erect a one-story garage at 1st and Court streets; the estimated cost is $10,000.

The Keeton Motor Car Co., of Chicago, has leased new salesrooms at 2025 South Michigan avenue; the annual rental is $2,600.

The Morningside Dray & Transfer Co., of Sioux City, Ia., has been granted permission to build a new garage; it will cost $3,000.

The La France Garage Co., of Elmira, N. Y., is erecting a new garage; the company is now located at 251 West Water street.

C. A. Jessup, of Kankakee, Ill., has taken over the E. J. Labeau garage and sales agency; it is located at 158-64 East Oak street.

Losher M. Livingsgood, of Reading, Pa., plans to erect a new garage. The site is on 4th street. The building will accommodate 35 cars.

Martin H. Averman and J. Ward Lyon, of Pittsburgh, Pa., have formed the Averman-Lyon Co. They handle Lozier cars at 5010 Penn avenue.

Charles E. Burnham, owner of the Palace Garage in Worcester, Mass., has awarded the contract for a new garage; the cost is estimated at $12,000.

Hubbard & Kirby, of Red Bank, N. J., plan to take possession of new quarters in the Harry C. Fay building; the present location is on Union street.

The Cartercar Wisconsin Co. of Milwaukee, Wis., is about to occupy new quarters at 2713 Grand avenue; the present location is at 222 4th street.

D. C. McKinnin, of Hughson, Cal., has purchased the interest of J. W. Van Selus in the Hughson Garage; the firm will now be Donaldson & McKinnin.

The Kittitas Auto Co., of Ellensburg, Wash., has broken ground for a one-story brick garage, 60 x 120 feet, at 4th and Water streets; it will cost $8,000.

L. R. Ellis and Frank Wassgarber, formerly dealers in Salina, Kan., are about to open salesrooms in Hutchinson, in the same State; they will stock Studebakers.

A. R. Cutts, of Wautoma, Wis., is soon to take possession of a new garage; it will be 47x80 feet, have a concrete floor and the equipment will provide for free air service.

Aaron G. Cohen, of New Britain, Conn., has sold his garage to T. H. Coggswell and A. C. Nordstrom; it is located on Chestnut street. The Ford agency is a part of the business.

Henry Braden, of Anaheim, Cal., who has been connected with P. J. Weisel & Co., has entered the trade for himself; he will open a garage and salesrooms on East Center street.

George D. Castle, formerly of Waterbury, Conn., and Chauncey Haight, formerly of Albany, N. Y., have leased the Miller Bros. Garage in Glens Falls, N. Y. It is located on Maple street.

J. H. Bolton, of Galveston, Tex., plans to erect a new garage to cost $15,000; he is located at 210 Post Office street and will place his new structure on the same street but between 24th and 25th streets.

M. Krotosoyner, of San Francisco, has secured plans for a one-story garage and salesrooms to be erected at Van Ness avenue and Pacific street; the building will represent an expenditure of $16,000.

The Auburn Sales Co., of Oakland, Cal., has taken possession of new salesrooms in the new and growing "automobile row" on Van Ness avenue; the company formerly was located on Golden Gate avenue.

Holmes & Olson, Firestone distributers in Oakland, Cal., have opened a branch store at 2543 Broadway; Frank M. Cary, for several years connected with the Studebaker business in that city, is manager.

The Equity Automobile Warehouse Co., of Minneapolis, Minn., is erecting a new two-story 2,000-car warehouse at Washington and 8th avenues; it will cost $50,000. H. E. Pence is the head of the company.

The Lister, Smith & Walsh Co., of Providence, R. I., has taken possession of new salesrooms at 37 Chestnut street; the company, which formerly was located on Dorrance street, handles Paige & Jackson cars.

L. W. Spencer, who has conducted an accessory business in Council Bluffs, Ia., at Broadway and Glen avenue, has admitted Roy Camblin, formerly of Omaha, Neb., to partnership; the business is to be extended.

The Suburban Garage Co. has been formed in Wauwatosa, Wis., a suburb of Milwaukee, to operate a garage and repair-shop; it is capitalized at $11,000 and is owned by A. D. and P. G. Warren and D. Krienitz.

G. H. Hafemeister, of Watertown, Wis., has disposed of his interests in the G. H. Hafemeister Motor Co. to Fred Klinger and Edward Radloff; they will operate as

Digitized by Google

Klinger & Radloff. The business includes the Ford agency.

The Bartlett-Smith Motor Co. has been formed in Syracuse, N. Y., by G. M. Bartlett and H. D. Smith; they have leased a garage at 211 Harrison street, formerly occupied by Bodine & Devoe, and will stock Studebakers.

The Knowles-McCallum Motor Co. has entered the trade in Des Moines, Ia., at 417 West 4th street; the company handles Colby cars. W. A. McCallum is president and treasurer and Roy Knowles vice-president and secretary.

The C. A. Chambers Co. has succeeded the McFarlan Six Sales Co., of Indianapolis, and will continue at the same location, on North Delaware street; Chambers was the principal member of the old company, which handled McFarlan cars, Standard and Federal trucks and the Hackney motor plow.

The Thorpe-Allen Motor Car Co., of Kansas City, Mo., is about to take possession of a new garage and salesrooms at 1506 McGee street; the company has taken on the Studebaker agency and will conduct its retail sales from the new location but will distribute in several surrounding counties from the old location at 1620 Grand avenue.

The Billings Auto & Tire Supply Co. has entered the trade in Milwaukee, Wis., at 181 4th street and will transact a retail and wholesale business in accessories, tires and supplies; Gordon P. Jahn is manager. The business is owned by F. G. Billings and his sons, Frank, Earl and Frederick, formerly engaged in the piano manufacturing and supply business.

William Hickox and Grant G. Smith, retired capitalists, have formed the Cole Motor Car Co. of Boston, which will handle that line of cars in the Boston territory; Conrad Smith, son of Grant G. Smith and a member of the G. E. & H. J. Habich Co., which formerly handled the account, continues with the new company, as do G. E. Habich and Edward Linehan, the latter of whom will remain as service manager. New salesrooms have been secured at 94 Massachusetts avenue, but the service station will be retained at 53 Bickerstaff street.

Recent Losses by Fire.

Cambridge, Mass. — Prospect Auto Co., 295 Prospect street; garage destroyed. Loss not stated.

Chickasha, Okla. — Chickasha Garage; struck by lightning and destroyed. Loss, $40,000.

St. Louis, Mo.—American Gasolene Co., Theresa street and Grand avenue; two oil tanks struck by lightning and 6,000 gallons of oil burned. Loss not stated.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Thomas J. King, Jr., has been appointed advertising manager of the Diamond Chain & Mfg. Co., of Indianapolis. King is a newcomer to the trade, having been previously connected with the Federal reservation service.

Walter A. Almy has been appointed sales manager of the Mercer Automobile Co., of Trenton, N. J. Previously he had the agency for Cadillac cars in White Plains, N. Y., and Trenton, and therefore knows the retail trade.

Louis Logie, former sales manager of the Tudhope Motor Co., of Orilla, Ont., has been appointed Canadian manager of the Lozier Motor Co., of Detroit. Before going to Canada, Logie served six years with the Ford Motor Co. and three years with the E. M. F. organization.

Robert P. Yeats, former export manager of the R. C. H. Corporation, has joined the Briggs-Detroiter Co. in a similar capacity He has been identified with the automobile trade since 1903, with the Olds, Buick and Hupp-Yeats and R. C. H. companies successively.

Frank H. Smith, who some three months since was appointed a special traveling representative of the Lozier Motor Co., has been promoted to the post of central district manager. He will make his headquarters in Chicago with the Bird-Sykes Co., which handles the Lozier car in that city.

H. T. Curtis has been appointed manager of the New England branch of the Invader Oil Co., and Howard M. Plowman, manager of the Invader branch in Philadelphia. Both men were previously identified with the Havoline Oil and Wolverine Lubricants companies and, therefore, "know their books."

Frank L. Klingsmith, previously its cashier, has been elected secretary of the Ford Motor Co., of Detroit. Heretofore the office was combined with the treasurership, filled by James Couzens, who recently was elected vice-president, to succeed John F. Dodge, and who, while relinquishing the secretaryship, still retains the treasury portfolio.

E. H. Horton, former sales manager of the R. C. H. Corporation, of Detroit, has been appointed sales manager of the Marion division of the J. I. Handley Co., of Indianapolis. In addition to his connection with the R. C. H. institution, Horton previously had acquired considerable experience in the sales department of the Chalmers Motor Co. F. G. W. Sudrow, the former Marion sales manager, has been transferred to the post of district manager of the Southern States, in which the Marion car is well intrenched.

Minor Business Troubles.

The Tobin Whichway Signal Co., of New York City, has filed its schedules in bankruptcy; they disclose liabilities are $26,711 and assets $2,433, consisting of stock $1,255, one car $500, trade mark $105, accounts $518, insurance $50, and cash $5.

Fred I. Tone has been appointed receiver for the Electro Light & Starter Co., of Indianapolis, which recently was petitioned into bankruptcy. There is still hope that the company will be relieved of its embarrassment and resume the manufacture of lighting and starting systems.

The Frederick A. Smith Co., Inc., of 230 West 58th street, New York City, a dealer in supplies and used cars, has filed a petition in bankruptcy; it states that its assets are $778, in outstanding accounts, and that its liabilities aggregate $20,236. Among the creditors are: Antonio D. Martina, $1,500; Farmers' Loan & Trust Co., $1,657; Motor Finance Co., $1,571; Yglesia Lobo & Co., $1,200. The company was incorporated in January, 1911, with a capitalization of $25,000. Frederick A. Smith is treasurer.

Charging that the Sandusky Auto Parts & Motor Truck Co., of Sandusky, Ohio, for which some of the stockholders asked a receiver following the collapse of the Michigan Buggy Co., committed acts of bankruptcy in this and other moves, creditors have filed a petition in bankruptcy against it. The receivership was asked because the Michigan company was a heavy debtor of the Sandusky concern and the failure seriously embarrassed the latter. The alleged acts of bankruptcy include the giving of preference to certain creditors May 17 by the issuance of $150,000 of bonds secured by a first mortgage. The petitioners and their claims are: General Electric Co., $430; Cornelius H. Neils, $54.30; Winter & Mathes, $647.63.

Valvoline Sues Mount Kisco Man.

The Valvoline Oil Co. this week filed suit in the Supreme Court for New York county against Frank E. Shearer, of 91 Main street, Mt. Kisco, N. Y. It claims to have sold him goods to the value of $1,569.79 between Jnue 30 and August 15, 1911, on which he was paid but $403.57, leaving a balance of $1,166.22.

WHEN "TALKING POINTS" FAIL OF EFFECT.

Seeing things as others see them is not always easy, but happy and successful is the salesman who possesses the gift. While it is well to be charged with "talking points," it is better far to know when and how not to make the most of them.

There are prospects who enter a salesroom with practically open minds and with little or no knowledge of what they want; but in most cases some sort of an idea has been formed as to the kind of car, or the features of a car, that will "fill the bill," and in such a case the salesman's talk may have just the opposite from the desired effect because he does not look through his prospect's eyes, so to speak.

"He told me at length what he thought of the car," complained a would-be purchaser of a gasolene car in recently recounting his experience. "But he didn't seem to care a particle about my own ideas as to what sort of a car I wanted. I was looking for a quiet little car that my wife could drive, but though the salesman assured me that any lady could handle his machine easily, he insisted on dwelling on mechanical details which did not interest my wife or me either, for that matter, and in extolling the high-gear hill-climbing qualities and the speed of the machine, which were equally uninteresting to us. No doubt the car would have answered the purpose very well, but my wife became nervous over the constant repetition of difficulties that in this particular machine had been eliminated; the existence of such difficulties impressed her while the claims of elimination did not. We wound up by buying an electric."

Not only is this a case from real life, but it was related by the man who sold the electric and who was wise enough to so completely avoid the mechanical aspect that he created the impression that the mechanism of the car was a vague something that made the car go but, like the "insides" of a telephone, was best left to itself, so far as the lady herself was concerned.

The case is, perhaps, a little extreme, but the moral is plain. A prospect usually has a more or less well developed mental picture of the car he wants, and it is the duty of the salesman to get a glimpse of that picture if he can. He will then be in a position to fit his car into the picture as well as the circumstances will permit.

A MAN NOT AFRAID OF RESPONSIBILITY.

It is not often that the death of a man who is not what may be termed a captain of industry causes a more widespread shock than was caused by the death of George W. Bennett, general manager of the Willys-Overland Co.

At no time the actual head or owner of a business, and never a self-seeker, Bennett was, nevertheless, one of the commanding figures of the industry. That he left a mark is not to be gainsaid.

He resorted to none of those tricks or artifices which so often are cloaked by the term diplomacy; they were foreign to his nature. His was a positive character; there was nothing negative in his make-up. He commanded by sheer force of what he said and what he did. Far-seeing, and possessed of a gift for organization, he knew not only what to do, and how and when to do it, but he did not fear to do it. It was these attributes which made him one of the truly great sales generals.

Summarized, and pointing to the moral contained in his career, he best may be described as a man not afraid of responsibility—a fear which half-makes or unmakes so many men placed in positions of power. Too many men, though they may be able to plan, cannot execute; they are unfitted for responsibility; others do not know how to bear the burden, or they bear it in a halting, timorous, struggling fashion which serves no great ends. They must needs lean on someone or something and find moral, if not mental or physical, support from some source, sometimes consciously, at other times secretly or unconsciously.

Bennett could plan and he could execute, and he was his own support; he gloried in responsibility and made his greatest mark when the greatest burden of it was placed on his shoulders and he was permitted to carry it in largely his own way, and by his own methods. He was a strong man because of his own strength.

There are few industries which would not be the better for the existence of more Bennetts. Though he did not rank as a captain of industry, George Bennett was a first lieutenant in all that the term suggests, and few great men and few great movements attain to great heights without lieutenants of the sort.

75% PROFIT IN CYCLECAR! NO? READ THE PROSPECTUS

Detroit Companies Present Glowing Display of Drawings and Promises —Use Ford's Success to Spur on Possible Investors.

If anyone desires to invest money in cyclecars, either the Detroit Cycle Car Co., or the Princess Cycle Car Co., both of which have offices in Detroit, will be mightily glad to receive it. Both companies have complete blueprints for cars which it is figured can be produced for less than $400, but just now they are offering shares—not cars—for sale.

According to the Princess company's prospectus, on an output of 3,000 $375 cars, there will be a net profit of $50 on each car, equivalent to a dividend of 75 per cent. on its entire capital. The Detroit Cycle Car Co. does not attempt to definitely forecast profits, but both promoters are making the most of Henry Ford's success and the $10,000,000 "melon" which the Ford company recently divided; in fact, Ford's success is made to appear the principal reason why men with money should put it into cyclecars. The painting of the picture by the Detroit Cycle Car Co. is particularly interesting and discloses the thought that fills the heads of those who believe there are uncounted millions to be grasped. Gaze on it:

"Would you like to own some Ford Motor Co. stock? Of course you would, but it's too late. You are probably one of those who had the chance, just a few years ago, to get in with Ford. You were skeptical and afraid and wanted to see a whole lot for your money. You were from Missouri and wanted to be shown.

"Mr. Ford has shown you, but you don't own any of his stock and you were not one of the men who helped cut that big $10,000,000 melon a short time ago. He does not need your money to-day, so that's an opportunity you have lost.

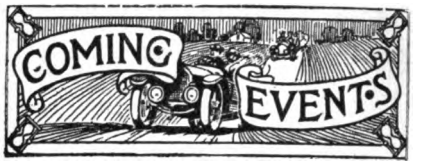
"Here is one real opportunity in the cyclecar field. Are you asleep or on the job? Are you going to wait to be shown, or will you join now, profit by past experience, and help organize the largest, best company you ever had the opportunity to help promote and build?

"This business promises to become one of the largest industrial motor car companies in America. Just because it's new, don't sit there and say 'bah!' Look around and inquire of the man who is 'up to snuff' in the game, and if he is posted he will tell you it's the 'biggest,' healthiest baby ever born in the automobile industry.

"There are some men who can only look backward, who live only in the past, can think of only what they were, what they might have accomplished, if they only had a chance. To such men we wish to say Good Night, Nurse!

"We want men who can look ahead; who can plan and see the future; men who do things; who have the courage of their convictions; who can invest $100 or more without placing their families in want; men who can afford to take a real chance.

"Henry Ford is a leader. He is the man to-day that is responsible for the big demand in low-priced cars. He has created the desire in the hearts of hundreds of thousands to possess an automobile who cannot afford to pay even his low price and who are now waiting—almost fighting—to buy one at $375.



"Mr. Ford has only scratched the field of possible sales. He is unable to keep up with the vast business which he has created and has but irritated this vast market to the extent where ten factories the size of the present Ford plant will not be able to fill the demand for low-priced cars in the next five years to come.

"Now the question is, Are you awake to the fact, or are you dreaming and groping in the dark while this real opportunity is hammering at your door with a sledge hammer? If you are the type of man who is timid and afraid, you will let this opportunity go by; if a man of courage and foresight, you will go forth and help build up and create this great auto industry. Some one is going to make some money. Are you going to be one of them?"

Legal Rebound of Stock's Spring Wheel.

Whether Robert Stock, of Mount Vernon, N. Y., converted to his own use the factory equipment and patents of the Robert Stock Auto Spring Wheel Co., Inc., is the point at issue in an action which the corporation brought this week against Stock in the Supreme Court for New York county. The company says he did; Stock says he didn't, and refuses to pay the $10,000 damages which is the amount the company demands.

Stock, who is an inventor, secured some spring wheel patents several years ago and two years ago formed the company, with the assistance of Joseph Bokelman, of Yonkers, N. Y. A factory was secured at Mount Vernon and equipped, but little manufacturing was done, and it now is charged that between March 17 and July 1 of this year Stock sold, disposed of or converted to his own use the equipment and patents. In the answer which he sets up he admits that the property in question belonged to the corporation in question but denies everything else.

PROMISE OF CHEAPER FUEL PROVES TO BE FALSE ALARM

Motor Spirit Rediscovered, but it Remains in "Stink Stage"—Prohibitive Cost of "Sweetening" Precludes Lowered Price.

Press despatches from Ohio dealing with what is described as a "tremendous upheaval in the oil refinery business," due to a "new process of obtaining gasolene, controlled by Standard Oil interests," prove to be largely a false alarm. The reports state that the new process probably will bring about a reduction of four cents in the price of gasolene. Men on the very inside of Standard Oil, however, state that the "new process" is none other than that discovered by Dr. Burton—which, incidentally, it has been found was discovered by a German some 25 years ago—and by which "motor spirit," widely heralded only a few months ago, was produced in limited quantities.

Motor World's informants go further and state that the producers of "motor spirit," which was to sell for about three cents less than gasolene, have had their own troubles in making it a thoroughly commercial fuel for automobile use. While possessing few drawbacks for motor truck or stationary engine use, in pleasure car usage it gave out an odor which, it is stated, made limburger cheese appear cologne by comparison.

In other words, as these Standard Oil experts technically express it, "motor spirit" when first announced had been developed only to what they term the "stink stage." The process of "sweetening" it proved so expensive that it has been found that "motor spirit" cannot be marketed at less than the present price of gasolene. Prophecies of a "tremendous upheaval," therefore, are chiefly wishes that are father to the thought.

Eleven-Year-Old Suit is Discontinued.

When an order was issued this week in the United States District Court for the Southern District of New York in the case of Whitney Motor Wagon Co. vs. White Sewing Machine Co., there was an audible rattle of dry bones and a reviving of memories of the old steam automobile days. The order was one discontinuing the action.

The suit was brought July 15, 1902, 11 years ago, and was for alleged infringement of patent No. 652,941, issued to George E. Whitney, July 3, 1900, and covering the running gear of a steam buggy. The suit made little progress and has been classified as a "dead one" for years. The Whitney company operated, nominally, at least, in Kittery, Me., and the White Sewing Machine Co. was the forerunner of The White Co., which manufactured steam automobiles for many years and which is still producing a few.

Lake Lines Abandon Proposed Rule.

Due to the efforts of the general traffic department of the Automobile Chamber of Commerce, the Association of Lake Lines, which includes the steamship companies operating on the Great Lakes, has been induced to alter its purpose to make more stringent the regulation applying to automobiles. Originally the association considered the establishment of a rule which would put automobiles and other vehicles on a restricted list, giving to local agents authority to refuse or accept such shipments at their option. The A. C. C. traffic department was represented at the meeting at which the subject was introduced and, as a result, the proposed rule will apply only to boats handling freight exclusively. There will be no change in the present shipping regulations on vessels which handle both freight and passenger business; they will continue to accept automobiles unreservedly.

Many Cars Owned in Foreign Lands.

According to figures gathered by the British Board of Trade, there are only 200 automobiles in the Empire of Japan, while there are 400 in the city of Shanghai, China, alone, and 829 in Cairo, Egypt. Additional figures from the same source indicate a total of 4,182 cars in British South Africa, 6,009 in Victoria, Aus., 4,469 in New Zealand, 981 in Tasmania, 900 in Victoria, B. C., 950 in Edmonton, Alberta, 2,000 in Mexico, 644 in Norway, 1,942 in Sweden, and 450 in Siam.

Bigger Dividend from Texaco Oils.

The heavy advance in the price of crude oil and gasolene during the past year has enabled the Texas Co., producers of Texaco oils, to declare a quarterly dividend of 1¾ per cent., thus placing its stock on a 7 per cent. basis. This represents an increase of ¼ of 1 per cent. over the previous quarterly distribution, which two years ago was reduced from 2½ per cent. to 1¼ per cent.

Germany's Exports Show Great Gains.

Germany's exportation of automobiles is still expanding. For the first six months of the year, there were sent abroad 4,417 cars, valued at $10,204,500, as against 3,761, valued at $7,447,500, during the first half of 1912. Russia is not only Germany's largest customer, but shows by far the greatest proportionate increase.

PACKARD BRANCH TAKES UP THE SALE OF ACCESSORIES

Action Marks Radical Departure from Previous Policy—Gives Discount on Tires and Combination Price on Other Supplies.

Although for more than two months the Packard branch in New York has been engaged in the sale of tires and accessories, the fact appears to be little known. If for no other reason than that it marks a radical departure from the Packard policy, it is of more than local or passing moment. Officials of the New York branch, however, are straightforward in explaining the whys and wherefores of the case.

They frankly admit that they discovered that they were turning away thousands of dollars each year which might as well be directed into their coffers, and as a stock of accessories in no way detracts from the splendor of even a palatial Packard branch, they are now making the most of these products.

That their judgment is correct is indicated by the fact that since the accessory department was instituted, less than three months ago, its sales have amounted to $23,000, of which $8,000 is represented by tires.

In the sale of the latter, the Packard people are openly quoting a discount of 7½ per cent., with an additional 5 per cent. for cash, the discounts applying to practically all of the well-known brands, about a dozen being quoted.

Likewise the Packard branch is making a specialty of quoting a combination price when a number of different articles are taken by one purchaser. One such combination offer is made up of the following articles:

	List.
Klaxon horn	$35.00
Warner M or N instrument	125.00
Trunk rack	12.00
Sager Diamond bumper	25.00
Tire cover—Allen (per pair)	9.50
Tire trunk—Ajax	21.00
Baggage trunk (3 suitcase)	75.00
Slip covers (7 passenger)	75.00
Kellogg pump	38.25
Lamp bulbs (with case)	4.75
Tire complete P. T. (36 x 4½)	47.50
Tire complete P. T. (37 x 5)	59.50
	$527.45

The Packard selling price for the combination is $370, a saving of $157.45 to the consumer.

The Harrolds Motor Car Co., the Pierce-Arrow agents in New York City, have also recently undertaken the sale of tires, but only to Pierce-Arrow owners, to all of whom is quoted a flat discount of 12 per cent.

SALESMAN THE BUYER'S EQUAL

Assertion of Equality Often Helps in Strengthening Arguments — Parvenu Who Bought After Salesman Asserted His Position.

Through the death of a relative she had recently become possessed of sufficient means to buy an electric car; she had always wanted one. She tripped into the office of the electric car salesroom with just as much of an "air" as if she had been feeding off gold-tipped spoons from the very first day till now. The salesman was equal to the occasion, and his "air" was just as "grand" as hers—in fact, he went her several degrees better, with the result that she soon felt very much at home and shortly after her arrival was arranging for a demonstration. Promptly at the hour set the salesman called on her.

Salesman Waited More Than Half Hour.

"If you don't mind," she suggested, "I should like to drive to Burns avenue, where I want to stop for a moment to speak to a very dear friend of mine regarding an apartment which I expect to lease for the winter." Of course, the salesman did not mind a few minutes, more or less. He obligingly drove her to Burns avenue. She stepped out and disappeared. He waited, and waited, and waited. Thirty-seven minutes passed before she returned.

"Oh, I owe you an apology, Mr. Brown, for keeping you waiting so long; I am so sorry!" she said. Instead of replying, "Oh, never mind that—it's only a trifle," or something equally diplomatic Brown blurted out: "You certainly do owe me an apology. You must fancy I'm a chauffeur. You have kept me waiting exactly thirty-seven minutes, and I am surprised that you should be so wasteful of my time. I must get back to the office immediately. If you will let me know where it will be convenient to let you off, I will drop you there and make arrangements for a demonstration at some other time."

The little woman lost all her "air" at once. She was human and contrite. She no longer tried to be superior to the salesman but treated him as an equal, and two days later he made the sale. This was a case where the "dope" was all wrong and an entirely different method won out.

EFFECT OF KEEPING PROMISES REGARDING REPAIR WORK

A promise is an obligation until it is discharged. If you told the man you would have the job ready at six o'clock, see that he gets it at that time. Nothing will make a customer develop a grouch more quickly than having to "wait around and wait around and wait around," as someone aptly expressed it. It takes energy and supervision to be the one place in town where people do not have to wait, but it is worth big money. Try to acquire the reputation.

FACTORS THAT MAKE FOR AUTOMOBILE DEALER'S SUCCESS

When a man has sold automobiles at retail and has then made a success of his job as sales manager for a big manufacturer, what he says regarding the business of selling automobiles is sure to be more or less instructive.

"Lack of merchandising experience and ability is responsible for most of the failures in the automobile business," is the opinion of one such man. "When people stop looking at it as a business that is 'peculiar' and 'different' and begin to realize that, with all its differences, the automobile business is exactly the same as any other business except that one has to work a little harder at it to make any money, there will be just as much or more money in it as there is in most other businesses.

"The grocer must carefully watch his accounts, watch his buying, watch his payroll, his rent, his insurance and all the other items that make his out-go and income. He keeps records and keeps them up-to-date. So does the successful hardware man, and the drygoods merchant and the merchant in other lines. He analyzes and buys his stock to fit his needs and not to oblige the salesman or because somebody else in town has a similar line of goods. If he is successful it will usually be found that he sells what the community needs and keeps his stock turning over frequently. That's exactly what the successful automobile merchant is doing—and must do."

FOLLOW-UP SYSTEM THAT DIFFERS FROM THE USUAL

The Detroit branch of the Anderson Electric Car Co. has some 600 or more Detroit electrics on the streets of that city, and yet in the following up of prospects their method is diametrically opposed to that followed in the sale of the vast majority of gasolene machines. One of the foundation rules of the sales department is: "Do not chase or hound a prospect."

In accordance with this idea 95 per cent. of all calls are made by appointment. If a prospective customer is not sufficiently interested to request the salesman to call when he is endeavoring to make an appointment, they do not bother with him, but let him go his way. On the other hand, if one of their salesmen does get in he tells the story in such a way that the prospective buyer knows someone has been there from the Detroit electric. If, at the close of the interview, the prospect should say, "I will not be ready to talk business for six months," it is six months before another Detroit electric salesman calls on him. The result of this policy is that people do not fear the electric car salesman and they obtain audiences with a class of people who could not be persuaded to talk to salesmen of the ordinary type.

AWAKENDISING WORLD

MAKING PROSPECT "LOOK UP"

Wisdom of Leading Buyer of Car Toward Higher Instead of Lower Price—Salesman Who Got "Buck Fever" and Lost a Sale.

A big, handsome man walked into the salesroom of one of the largest electric car dealers in his vicinity. The new salesman arose rather timidly and went forward to meet him. "I am going to buy an electric car for $2,000," rather gruffly announced the visitor.

The salesman had "buck fever." He raced his legs off digging up used cars that were bargains at the big man's figure. He showed no less than eight cars and then went to the upper floors to see if there were not some more. But the big man was not suited. He said very little but he spoke emphatically when he did speak.

"You give me no choice; the cars you show me are practically all the same. Nothing you have appeals to me," he said.

Tried to Meet Price Buyer Fixed.

The salesman tried to locate the manager, but unavailingly. The near-customer departed. The salesman nearly had a fit. He had worked as hard as he knew how; he had shaded prices to meet the $2,000 limit. Still the customer had gone. Why hadn't he made the sale? It never dawned on the salesman that possibly he might have sold the man a new car at a higher price.

Months afterward, when through the ordinary course of human events he had become well acquainted with the big man, who proved to be the president of a large company, he found out why he had not made the sale.

"You went sound asleep that time I was trying to buy a car from you. You could have sold me a new car just as well as not," said the president. "Well, why didn't you tell me? You said you wanted a car for $2,000." "Why should I tell you?" was the reply. "It was up to you, and you had me all the time fussing around looking down when you should have had me looking up."

The salesman thought it over and he has never since made the same mistake.

PLANNING TOMORROW'S WORK AND NOT PLANNING TOO MUCH

Do you plan for the morrow or do you live from hand-to-mouth? The housekeeper who goes to bed without knowing exactly what is on hand for tomorrow's meals causes someone to go hungry and will soon be out of a job. Tomorrow's work must be planned today; no man ever grew big without looking ahead. Right here a wise business man says, 'Dont' plan too much work for the morrow; plan what you know you can do—and do it."

People will always wait if you let them wait. Is there any real reason why that prospect should not buy today? Study the case. What will precipitate action? If you think it over hard enough you will be sure to get the answer.

"Nine men out of ten," says Prof. Williams, "lay out their plans on too vast a scale; and they who are competent to do almost anything do nothing, because they never make up their minds distinctly as to what they want or what they intend to be."

THREE YEARS OF PERSISTENCE THAT BROUGHT ITS REWARD

"The older I grow in this business the more I recognize the fact that stick-to-itiveness is a quality that every salesman can cultivate to his profit," said a tire and rubber salesman. "During the winter months I travel down South, where there is one firm in Atlanta whose purchasing agent would always send back my card with the statement that they were all contracted for on my line and there was no use wasting my time or his. Next time I visited Atlanta my card went up to him just the same. They were large buyers, and I knew if I could ever get their business it would be a great feather in my cap.

"It took three years of calling before I ever saw that purchasing agent. One day I sent in my card as usual and he asked me to come right in. Something had happened so that they were in the market. I hung around Atlanta for three days but could not get them to sign up. Finally I left for the next city on my route, and just got there when a telegram arrived asking me to be in Atlanta in the morning. I got there on schedule time and booked an order for $17,000. Some order! But those Southern fellows buy right and their trade is worth having. I could tell you of a hundred cases where persistency has been just as effective."

WHEREIN LISTS OF PROSPECTS AND LISTS OF NAMES DIFFER

"Too many names on their prospect list—that is the fault of nine out of ten automobile salesmen," said a live wire who has been and is successfully selling both gasolene and electric cars. "I would rather have 10 live prospects than 275 names such as most of the men in our institution carry around with them. There is an awful difference between names and prospects; but some salesmen never see it. Until I have seen and talked with a man and learned that he is actually going to buy some kind of a car I do not regard him as a prospect. Until that time he is simply a name. But, after I have interviewed him and learned the facts I put him on the prospect list if he belongs there and get down to business.

"Hugh Chalmers's idea of the 'Ten Most Important Things to do To-Day' is of immense value to the salesman who adopts it and sticks to it. Ten calls may be far too many; three may be enough, but whatever is the standard, it should be aimed at systematically and thoroughly."

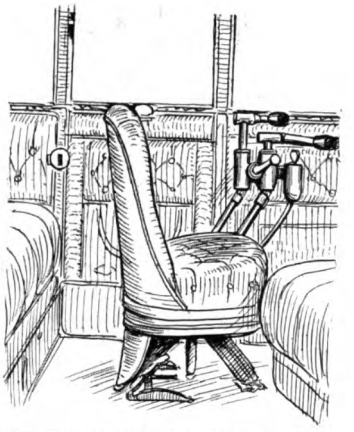
UNIT TRANSFER CONTROL FOR GRINNELL ELECTRICS

Front or Rear Drive Made Possible With Single Set of Levers—Radical Feature Incorporated in French Brougham.

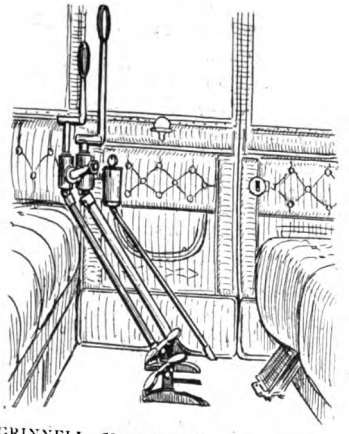


In what is styled a French brougham, which can be driven from either the front or the rear seat by means of a single set of levers, the Grinnell Electric Car Co., of Detroit, has developed and adopted a controlling system that is radically different from anything of the sort ever applied to electric vehicles, while the brougham itself incorporates a number of other highly desirable features that legitimately can be expected to increase the factor of safety and to make easier the work of the driver.

Specifically, the new system is styled by the manufacturers a "unit transfer control" and the designation comes very near to telling the whole story. As may be seen by the accompanying illustrations, control of the car is vested in a single set of levers constituting the usual lever steering arm and the controller handle which is mounted with it. By means of a system of ball and socket joints, the set of levers can be swung forward, when it is desired to drive the car from one of the front seats, or backward when the driver occupies one of the deeply cushioned rear seats. In either position the complete control mechanism is securely locked and cannot be moved except by specific intention of the operator. The lock for the controller handle is mounted just in front of the steering arm.

The use of this unit transfer control obviously necessitates the provision of duplicate brake pedals, one set being clearly shown in one of the pictures, which also shows the extension at the back of the swivelling front seat which effectually masks the pedals and prevents their operation by accident or design by those who may be occupying the rear seat.

Palpably, one of the principal advantages of the new control system is that it very effectually prevents any one other than the driver "fussing" with the controls during the time when the control of the car ought logically to be in the hands of but one person. A secondary, though none the less important advantage is that the construction is beautifully simple and that it occupies the minimum of room in either position. Incidentally, the single control makes for that degree of positiveness that is highly desirable in any car.



In other respects, the new brougham is a more than ordinarily roomy car, seating five persons comfortably, and upholstered with a view to obtaining the greatest possible freedom from the little jars that may not be absorbed by the spring suspension. The rear seat is wide and the front seats are of a double-motion swiveling type for which patents have been asked. The front driver's seat, of course, swings back. The body has been designed to eliminate un-

CONTROL SWUNG FORWARD SHOWING SWIVELING SEAT

sightly angles, to which end the back is patterned after the gasolene limousine fashion, except that the glass panels are so arranged that the driver is afforded a clear vision to the rear. Batteries are balanced, half being in front and half in the rear.

In the mechanical construction of the

GRINNELL SINGLE CONTROL "TRANSFERRED" TO REAR SEAT

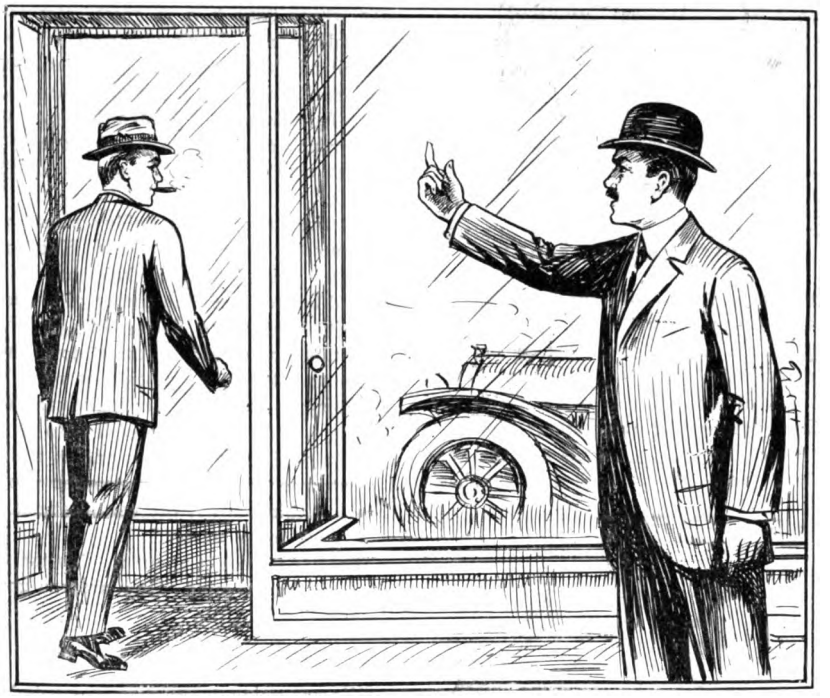
car, Grinnell characteristics have been perpetuated, the motor driving through a straight shaft without intermediate reduction other than that afforded by the rear axle driving gears. Brakes, of which there are two sets operating on rear wheel drums, are controlled by pedals, one for the service and one for the emergency. Springs are full elliptic both front and rear and the wheelbase is 105 inches. The tread is standard, of course, and the wheels may be shod with either Motz electric cushion tires measuring 36 x 4½ or Morgan & Wright special electric pneumatics measuring 34 x 4½; in this case Knobby tread tires are fitted to the rear. The speeds, according to the controller, are 3, 8, 12, 18 and 21 miles an hour, and the capacity of the battery on a single charge varies from 65 to 100 miles, according to the nature of the roads.

The equipment, which is included in the price—$3,400—is as follows: Divided front window with storm tilting clear vision windshield; ventilator designed to exclude front wheel dust; the usual complement of lamps; interior dome lamps; cut glass bouquet holder; limousine clock; clothes brush with morocco holder; silk roller curtains, carpet; either electric horn or bell; and a complete assortment of the usual necessary tools.

Putting Graphite in the Public Eye.

As a supplement to the extensive newspaper advertising campaign that has been inaugurated by the Jos. Dixon Crucible Co., of Jersey City, N. J., as a means to stimulate the sales of its graphite products, the Auto Supply Co., of New York City, of which George Robertson is president, is one of a number of metropolitan supply dealers that have adopted with no small degree of success the "one idea" graphite window display.

The window that Robertson has chosen to receive the "graphite idea" is a broad one that faces on Columbus Circle, where it is certain to draw the gaze of the thousands of pedestrians who daily turn this busy corner into Broadway, and that it not only attracts attention but holds it as well is indicated by the fact that there are few who see it who can resist the temptation to stop. Incidentally, it is worth knowing that the display has resulted in a considerable quickening of graphite sales.



The idea around which the window is built is not a new one, though it is none the less effective. For a background there is a large, clear black and white drawing showing the top view of a stripped chassis. From every part of the chassis where graphite can be used to advantage as a lubricant white ribbons lead to small cards glued to the window, naming the part and the grade of graphite lubricant best suited to its needs. On the floor of the window there are little piles of dry graphite, and graphite grease flanked by pails of graphite lubricants of varying consistencies. Serving as a frame for the "picture," there are photographs of a number of well-known racing drivers who have used Dixon's graphite lubricants and who endorse them in letters which are attached to their pictures.

NO "FLOOR MAN" THE TRADE'S GREATEST LAPSE

Meeting the Salesroom Visitor at the Door Vitally Important, Declares Reilly—Fresh From a Personal Experience, He Warmly Discusses With Sales Manager What He Says Is "Business Crime."

Reilly was deep in thought as he walked rapidly down the street, and his temporary abstraction was not yet dissipated as he turned almost automatically in toward the door of Merton Rossman's salesrooms. His foot was almost on the threshold and his hand was reaching for the door handle when

REILLY'S HAND WAS REACHING FOR THE DOOR WHEN HE HEARD HIS NAME CALLED

he turned with a start as he heard his name called in a voice he was not slow to recognize.

"Oh, hello, Jim!" he exclaimed with hand outstretched to the factory Sales Manager, who was approaching in the near distance.

"Wait a minute, I've got to see Rossman; then I'm going right back," said Reilly; then he added, "Come in with me; I won't be long."

The two stepped inside the salesroom and looked around; then they looked around some more—and then some. Upon the floor were two late models of the line Rossman handled, but Rossman was not in sight. Neither was his salesman, so Reilly and the Sales Manager began an inspection of the cars.

Finally a mechanic entered from somewhere in the rear of the place and of him was inquired where his employer, Rossman, might be.

"In the office, I guess," and he passed on with a gesture toward a door the two visitors had thus far not discovered.

Reilly and the Sales Manager moved back upon the floor and, peering through a door, discovered Rossman in his office reading a paper.

"Oh, hello, Reilly!" he exclaimed, as he threw down the paper and started to his feet.

"Came darned near stealing a car on you," said Reilly. "Didn't see any one to stop me, and I rather like the looks of that touring model."

After the Sales Manager and Rossman had been made acquainted, the former had strolled out onto the floor to permit the two dealers to transact their business. He was soon rejoined by Reilly, and the two departed.

Hardly were they upon the sidewalk when Reilly disgustedly exclaimed, "Jim, did you ever see anything like it? Did you ever see such a glaring example of bonehead business?"

"What do you mean?"

"This leaving salesrooms deserted and not having anyone to take care of people who come in."

"Oh!" replied the Sales Manager, the light dawning, "that's so common I didn't notice it. They all do it."

Measuring Neglect in Real Money.

"Yes, probably a majority, anyway, and that's what makes it all the worse. It certainly makes me disgusted with the whole darned trade to see the way some dealers run their salesrooms. They don't act as if they had an ounce of business sense or gave a hoot whether they did any business or not. Look at Rossman! We ambled around the salesroom floor by ourselves for five minutes and no one ever came near us. We could have walked out, and he didn't seem to care whether we did or not. Supposing we had been going to buy a car; how long would we have hung around there before we would have walked out and never come back?"

"Not long."

"And that one instance of a little lack of up-to-the-minute business management would have cost Rossman $400. If there are 20 dealers in town and each one of them did that once a day and lost $400, that would mean a loss of $8,000. That's more than the trade in this town can afford to throw away to-day, believe me! Dollars don't grow on bushes any more. Cars are sold, not bought.

Naming Greatest Lapse of the Trade.

"Why, Jim, it makes me sore, the way some of those dealers act. They need badly to be pulled up to a higher level and the trade made a better and a real selling business, but a lot of them just drift along in a don't-give-a-damn way and trust to luck to come out somewhere. If there is one thing which is in greatest need of a remedy it is that of not meeting people when they walk in the salesroom door. It is the greatest lapse in the trade. Not only that, but it is a business crime. You may remember how they used to teach us in Sunday school that there are sins of commission and sins of omission, and if this isn't a sin

Digitized by Google

of omission, and a mighty big one, too, I'll eat—I'll eat——"

Reilly was stuck for words. His opinion on the subject was being hammered home with emphatic gestures, and the Sales Manager had been tacitly agreeing.

"I've talked it until I'm black in the face," contributed the Sales Manager, "and it doesn't seem to do much good. Some of our dealers have improved a little and some of them quite a little, but they don't seem to realize what it means to them. They all wolf about how they don't do the business they think they should and about how they would like to see their sales climb up, and all the time they are about as efficient as a wooden Indian that stands out in front of a cigar store holding out his hand. They hold out their hands with their wares and if a prospect walks in and buys, all well and good; but they are as far from the true merchandizing level as east is from west.

How a Near-Sale Was Chilled to Death.

"One of my neighbors down home was telling me about how he almost bought a —— car when he was in New York last spring. He said he was walking up Broadway with his wife when they saw a car in a window. It looked pretty good to them and they decided to investigate. I might add that if they had wanted to buy the car the price wouldn't have stood in the way at all; in fact, he later bought one of the highest-priced ones there is. He and his wife walked in and took a closer look at the car and wondered what the price was and so forth. They wondered for about ten minutes and then began to feel rather cheap and in the way when no one paid any attention to them, and the colored porter eyed them up but said nothing. When a salesman finally did decide to see what they wanted, they left. They——"

"That's just it, Jim!" exclaimed Reilly; "wife . . . is the dealer's opportunity for establishing the basis of all future relationships. Whatever reception the man gets is quite likely to have its influence on all his future relations with the dealer; if the dealer or a salesman meets him as soon as he enters and endeavors to answer the man's inquiries in a pleasant way, the man is likely to think better of the dealer than he is if he is allowed to wander around with no attention.

Embarrasses Buyer and Injures Dealer.

"Not only is the dealer passing up a big opportunity, but he is making the man who comes in feel like 30 cents. You know yourself just how it feels if you walk into a salesroom and have to hang around the floor for ten minutes with no attention. You begin to feel as if you were an intruder, and if you stay 12 minutes you wish you hadn't come at all. There is a dealer in town here who, so far as I know, never met a prospect on the floor but once, and that was an accident. The dealer just happened to be there when the man came in.

"NOT ONLY THAT BUT IT IS A BUSINESS CRIME," ASSERTED REILLY

"I can't understand it at all. Automobile dealers are supposed to be business men and salesmen, also, but they show a sad lack of something or other in this particular matter. Manufacturers' literature for dealers, the house organs and the good dealers' trade papers have laid emphasis upon this thing, and it is utterly beyond me to comprehend why all the teaching has no effect.

"IF YOU WAKE ONE DEALER YOUR WORK IS NOT IN VAIN," REPLIED REILLY

"Dealers who need instruction in how to run a business are advised to look to other lines of trade for inspiration and ideas. Can you imagine a grocery store, or a haberdashery, or any other store which would let a customer come in and stand around for a couple of weeks before asking him what he wanted. The improvement would cost nothing, neither in money nor in effort, and why it isn't made is a puzzle to me.

"Assuming that a man has a small selling force and that a couple of people happen upon the floor at the same time; he can very easily excuse himself with the man he is talking to, say a word to the newcomer and keep in touch with both of them, whereas if he entirely neglects the second man the latter may get tired of waiting.

One Salesman Always on Floor Duty.

"When a dealer has any kind of a sales force, one salesman should always be detailed to floor duty. If necessary, there should be a little desk up forward for the man whose duty it is to greet entrants to the salesroom. Having several salesmen and all of them anchored in chairs at the back of the room is like going to Nova Scotia to fight Mexico; the Mexicans may like to fight and might go to Nova Scotia to do so, but they'd hate to be put to all that trouble."

The two had reached Reilly's salesrooms and entered the dealer's office. The Sales Manager settled into a chair, but Reilly hooked himself over the corner of his desk.

"Reilly," said the Sales Manager, "I'm glad this happened. I came down here partly to ask you a question or two. We are going to start a dealer uplift campaign of a sort, and one feature of it is to be the taking up of certain things one at a time. I wanted to ask you your ideas on two or three. I think this is the very best one we could pick for a starter."

"There's no doubt about it. It's the one big fault, in my mind. How are you going about it?"

Plans Campaign of Dealer Uplift.

"We are going to start in in our dealers' bulletin and hammer on this one phase of the business. We're going to hammer hard and make the dealers take notice of it. We're going to be persistent and make them see that we have a definite object, that we believe in the idea and want it put into effect, and that we believe every dealer can better himself by adopting the idea. The dealers will thereby recognize that the idea is something more than mere space-filling matter and that we mean what we say. After we have pounded them on this one theme we will take up another, but we plan to stick to one at a time and for quite a time and not scatter our fire."

"Great idea, Jim!" exclaimed Reilly. "It ought to work. That persistence ought to win for you, and if you don't do any more than wake up one dealer in all your territory your efforts will not have been in vain."

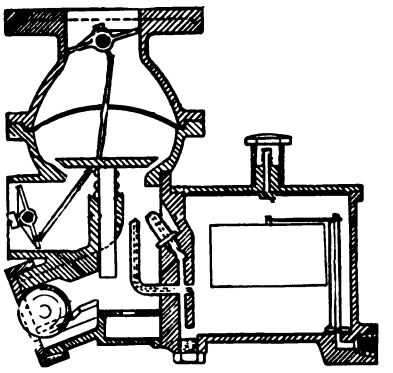
SUNDERMAN CARBURETTER IS SCIENTIFICALLY TESTED



A. C. A. Tests Show How Motor Efficiency is Affected by Mixture Proportions — Flexibility Demonstrated.

Emphasizing the necessity for very careful carburetter adjustment, if true economy of fuel is to be expected, a series of tests of a Sunderman Safety carburetter, the results of which just have been made public by the Testing Laboratory of the Automobile Club of America, makes plain that no small variation in the air and gasolene constituents of the mixture may exist without materially affecting the power output of the engine. Needless to add, however, such variations exert a very powerful influence on the efficiency of the engine and serve to indicate once more the almost extraordinary range of the air to gasolene ratio that will furnish an apparently good mixture.

The Sunderman Safety carburetter, which is made by the Sunderman Carburetter Corp., of Newburg, N. Y., differs from others in that it has a check valve between the throttle and the mixing chamber that is calculated effectually to prevent the possibility of back fires reaching the gasolene in the mixing chamber. A section of the carburetter is reproduced herewith, from which it may be seen that fuel flows from the float chamber through two nozzles, the lower of which is termed the low speed nozzle, and is independent of the needle valve. The upper, or high speed nozzle is controlled by a needle valve the position of which, when once adjusted, is determined by a tapered link attached to the throttle and so arranged as to open the needle valve as the throttle is opened. The low speed air adjustment is controlled by a steel ball which lifts off its seat and the high-speed air enters past a butterfly valve the position of which is controlled by the safety valve. This safety valve is normally held off its seat by a spring, but its position is determined by a small rod hinged to a projection on the throttle valve and hanging free through a hole in the perforated screen below.

The engine on which the tests were made was a four-cylinder Northway with cylinders measuring 4⅛ x 4¾ inches, and for ignition a Bosch DU4 model magneto was used. Runs were made with three different throttle positions: Wide open; throttle set so that the brake load at the speed of maximum power was one-half that at the same speed in the wide open throttle runs; and with the throttle so set that the maximum speed was one-half that of maximum power. In each case the ignition was set for the maximum power at each of the speeds.

Just how much the proportions of air and gasolene in the mixture may vary without affecting the power output is revealed by the tests with the throttle wide open. From approximately 350 revolutions, when a little more than seven horsepower was developed on the brake, to 1,250 revolutions, the power curve rises without a break to a little more than 30 horsepower, though despite this fact the ratio of air to gasolene in the mixture varies from 14 to 1 at the start, through 13.6 to 1 at 850 revolutions, 13 to 1 at 1,000 revolutions, and a little more than 13 to 1 at 1,250 revolutions. At 1,665 revolutions, which gave 34.1 horsepower, the ratio was as much as 16 to 1, and at 1,800 revolutions, which gave 34 horse-

SUNDERMAN CARBURETTER SECTION

power, it dropped off again to 15 to 1. Obviously, therefore, the greatest thermal efficiency of the engine—18.6 per cent.—was obtained at a speed of approximately 1,665 revolutions.

On both the wide open and half open throttle runs, the consumption of fuel averaged 0.75 pounds per brake horsepower hour, and analyses of seven samples of exhaust gas showed an average of 11.0 per cent. CO_2, 1.2 per cent. O_2 and 1.9 per cent. CO. During several runs when the throttle was varied, the motor accelerated rapidly under load, though occasional backfires were noted. After the motor had idled at about 380 revolutions for five minutes a sample of exhaust gas showed 5.0 per cent. CO_2, 5.3 per cent. O_2 and 3.7 per cent. CO. When the throttle then was suddenly opened, the time required for the engine to accelerate to 1,000 revolutions was approximately seven seconds, and to 1,600 revolutions, 19 seconds. The lowest consumption of fuel recorded was .67 pound per brake horsepower hour at 1,665 revolutions with the throttle wide open, and the highest .93 pound at 468 revolutions with the throttle 13 degrees open.

LEFT STEER AND STARTERS ADOPTED FOR REGAL LINE

One Chassis Dropped and Unusually Few Changes Made in Others— Added Equipment Causes Increase of Prices.

Serving as the chief mark which distinguishes the newer products of the Regal Motor Car Co., of Detroit, Mich., from their predecessors, the steering column has been shifted from the right side to the left side and the control levers to the center of the footboard, which is in line with the prevailing tendency.

In the general overhauling that has been given the line, model H, an underslung touring car with a 4¼ x 4½ motor and selling at $1,400, has been dropped, and to compensate, in a measure, for the addition of complete equipment, including Rushmore electric lighting and engine starting apparatus, the prices of the remaining models have been increased. Model T underslung touring car now lists at $1,125 instead of $950; model N, underslung roadster, lists at $1,125 instead of $900; model NC, underslung coupe, lists at $1,600 instead of $1,250; and model C, which is the conventional overslung touring car, lists at $1,350 instead of $1,250.

In the mechanical construction of the cars, the only alteration of note is the substitution of a roller bearing clutch collar for the one that has been used in the past. Bodies have been materially improved, however, and given a much cleaner appearance by the elimination of all external protuberances, including the usual side lamps, and the location of the spare tire carrier at the back of the tonneau; the coupe has lost its Colonial appearance and now is of the more conventional form.

With the elimination of one chassis, two remain, and of them one mounts a 3¾ x 4½-inch motor and the other a 4 x 5-inch motor; wheelbases remain 108 and 116 inches, respectively. In both, the four cylinders are cast in a block and in both chassis the transmission elements include large diameter cone clutches, three-speed selectively controlled gearsets and, in the underslungs, semi-elliptic springs both front and rear; in the overslung car the rear springs are of the three-quarter elliptic variety.

Whereas all the cars with the exception of the model that has been dropped heretofore have been listed without equipment, all now have complete equipment, including the Rushmore electric lighting and engine starting system. All bright metal parts now are finished in nickel plate.

"My Best Sale and Why I Regard It as My Best"

Making the Prospect Respect the Dealer's Determination Not to Become a Price-Cutter—How a Texas Salesman Engineered a Deal and Closed With a Man Who Already Had Made Up His Mind to Get a Discount.

By R. S. CARTER, Galveston, Tex.

SECURING LIST PRICE FROM AN INSISTENT PROSPECT THROUGH PERSEVERENCE AND INTEGRITY

Since February I have had the S—— agency, and during that time have made thirty-seven sales and secured the list price in each instance. Each of my customers is very well satisfied and boosting for me, and obtaining the list price at all times encourages this feeling. I believe this is a good record, in view of the fact that I had no advertised location until August 15th, when our new salesroom and service station were opened.

I believe the following was the most interesting sale I have made:

Telephone Call from Prospect's Wife.

Some few weeks ago my 'phone rang and a lady asked me for a price on a car, stating that she preferred a S——. I promptly endeavored to find out who she was, and quoted her the price. She refused to state who she was. Next day the same voice called up, and after quite a lot of persuasion on my part, she informed me that she was Mrs. R——. telling me that she was very anxious to get a car and that her husband also was interested. She requested me to call on her husband but cautioned me explicitly not to mention the fact that she had told me to call.

That day I called at her husband's office and explained my mission. He went up in the air, and the reason for his peevishness, as it later developed, was the fact that a friend of his had preceded me about 30 minutes, and upon learning that this gentleman was thinking of purchasing a car, had suggested that he would call on me and get me to offer him a commission which he would split with the customer.

When I quoted the prospective customer the list price, he would not listen to me at all; he practically ordered me out of his office, stating that nobody could hold him up, that he was experienced in the buying business and knew that he could do better.

When he went home to lunch he related his experience to his wife, who would have immediately explained everything but for the fact that they had visitors. As soon as possible she did explain and secured for me the privilege of another call.

I called the next day, and took Mr. R—— driving; he was very well pleased with the car, but held off purchasing. I worked on him pretty steadily for the following week with no satisfactory results.

Demanded a Cut of $48 in the Price.

On my next visit, he finally agreed to purchase the car if I would allow him a discount of $10 on the selling price, and furnish one tire and tire cover, making a total discount of $48, and he held out stubbornly for this concession for one week more. I resisted, stating that the list price was the selling price. Eventually he agreed to let the $10 go, but held out for the tire and tire cover. I could plainly see that Mr. R—— was going to stand his ground, especially in view of the fact that several other agents were pushing him hard and offering him liberal discounts.

It would, of course, have been a very simple matter to agree to this concession and make the sale. In the meantime Mrs. R—— was daily 'phoning me and had become very discouraged. After Mr. R—— made me the above proposition, I called up his wife and told her about it, explaining that I could not cut the price but would make her a present of the tire cover, which amounted to $3, if she would pay the $35, this, of course, without Mr. R——'s knowledge.

Allowed Wife to Pay the Discount.

I agreed to allow Mrs. R—— to do so at the rate of $5 a month, and Mrs. R——, knowing her husband's disposition and realizing the fact that I could not cut the price, finally agreed to it. I then immediately 'phoned Mr. R—— and asked for an appointment at three o'clock, at which time I agreed to close the deal upon his condition. He told me not to come until 4:30 and I very promptly grew nervous about the sale.

I 'phoned Mrs. R—— about my attempted appointment, and asked her not to answer the 'phone until after 4:30, explaining that this would avoid answering questions that might not be in favor of the sale. This she agreed to do. When I called at 4:30 the deal was closed. I secured the list price for a S—— 35 and Mrs. R—— made her husband a present of $35. Everybody is very well satisfied. This, I believe, demonstrates that a salesman can secure the list price if he perseveres.

Odd Means for Indoor Demonstrations.

As a means to the end, which is to obviate the necessity for asking prospective purchasers to step either into the garage or out into the street, the Packard Motor Car Co. of New York City has adopted an unusual method of making possible the demontsration of a car behind the plate glass of its palatial salesroom on upper Broadway. The demonstration car—one of the latest model "sixes"—stands in a corner of the room and leading from its exhaust pipe through a hole in the window sill to the outer air there is a long rubber hose that conducts the exhaust fumes out of the salesroom.

The hose is clamped to the exhaust pipe, making it a simple matter to demonstrate the ease with which any of the cars in the room can be started, for any of them can be connected to the extemporized exhaust pipe in a few minutes. The method also serves to demonstrate the quietness of the power plant, for, needless to add, even the slightest noise would be accentuated As the Packard is famously quiet in operation, the indoor demonstration is proving uncommonly effective.

Darkness that Makes Varnish "Green."

Although it is not generally known, light is absolutely necessary in the preservation of varnished surfaces. If a car is stored in a very dark garage, for instance, the varnish is likely to take on a greenish cast that no amount of washing will remove. The only remedy in this case is to rub the surface down with very finely ground pumice stone and water and supply a fresh coat of varnish. The obvious preventive is to not store the car in a dark place when it is possible to store it where the light can get at it.

IMPERIAL LINE LENGTHENED BY SIX CYLINDER MODEL

Another "Six" Replaces a "Four"—Three Four-Cylinder Machines Retained—All Electrically Started and Lighted.

An increased dimension here, an improved detail there—the various little things that the progressive automobile manufacturer finds to do in order that his product may be kept well abreast of the times—mark the revision of three of the four models that constituted the previous series of models built by the Imperial Automobile Co., of Jackson, Mich., and serve the purpose intended as well as emphasizing the fact that the Imperials did not need much tinkering to keep them up to date.

The most important thing, however, is that the line has been increased by the addition of a new and larger car—a "six" with a motor of 4⅛ x 5¼ inches bore and stroke—while model 44, formerly a "four," has been given a six-cylinder motor of 3¾ x 5¼ inches bore and stroke. All models now are electrically started and lighted.

IMPERIAL MODEL 34 WHICH SELLS FOR $1,650 WITH ELECTRIC STARTER

The new "six" is a typical Imperial, not only in general mechanical design but in appearance—in fact, throughout the line the only external change that is apparent at a casual glance is the fitting of inset dashboard lamps instead of the older type of bracketed sidelights. The motor of the new "six" is a Continental, as are all the Imperial motors in the latest series, and the cylinders are cast in threes. The unit power plant system is employed, the unit being hung on a three-point suspension. All the valves are on one side, the motor being of the L-head type. Ignition is by a dual system, with magneto for running and dry cells for starting.

A multiple disk clutch, with Raybestos-faced disks, transmits the power from the motor to the three-speed selectively controlled gearset, which is manipulated through a central lever; the steering wheel is placed on the left side of the car, is 18 inches in diameter and acts through a worm and gear mechanism. The rear axle is full-floating, with a pressed steel housing and 1⅝-inch chrome nickel steel shafts; the propeller shaft, of the same tough steel, is 1⅜ inches in diameter. The bevel gears have a ratio of 3½ to 1. Large annular ball bearings are fitted throughout the rear axle. In a big car big brakes are much to be desired; and in the new Imperial the drums are no less than 18 inches in diameter and the bands 2 inches wide; both service and emergency brakes work on the inside of the drums.

A drop of 5½ inches is given to the pressed steel frame to keep the body and the weight of the car low, for the sake of appearances as well as for more utilitarian purposes, such as convenience in getting in and out and stability on the road. Long, flexible springs support the car, 40-inch semi-elliptics in front and 53-inch three-quarter elliptics in the rear; the rear springs are underhung. Wheels are 36 inches in diameter, both front and rear, and all are shod with 4½-inch tires. The wheelbase is 137 inches and the tread the usual standard, 56 inches.

On the new chassis is mounted a roomy 7-passenger body which is ventilated by the action of the windshield as well as by ventilators in the doors. Regular finish is black, though special painting will be done at a slight advance in the price, which is $2,500, including standard equipment. The equipment includes electric starting and lighting system, as well as a generous outfit of the things that come under the category of equipment.

In metamorphosing model 44 from a "four" to a "six," the change has been complete, in its way, for there is little left of the older car except its model number and the distinctive Imperial appearance. The body still is a five-passenger touring, but it is more roomy than before, the increase of the wheelbase from 122 to 126 inches allowing leeway for the additional space. The motor, which, like that of the bigger "six," has its cylinders cast in threes, has a bore and stroke of 3¾ inches and 5¼ inches, respectively. In other respects, also, it is like the bigger engine. The likeness holds good, in fact, throughout the car, except that there is the difference that is natural and proper between a big machine and one that is less big. The tires are of the same size as those in the big "six"—36 x 4½ front and rear. The same finish and the same equipment, including electric starting and lighting system, are found in the model 44. The price, notwithstanding the enlargement of the machine and the augmentation of the number of cylinders in the motor, is $2,000, but $125 more than the older "four."

Model 34, which is a smaller five-passenger touring car, is possibly the least changed of any of the Imperials, for its specifications read just as they did before, though there are, of course, several of those little improvements that do not appear on the surface, but consist of betterment of material and workmanship and the like. The motor has four pair-cast cylinders of 4½ inches bore and 5¼ inches stroke, and, forming a unit plant with the three-speed gearset, is carried on a three-point suspension. The rear axle is full-floating, with malleable housing, and runs on plain nickel steel bearings, except for the annular thrust ball bearing behind the large bevel gear. The wheelbase is 118 inches, the tread standard, the tires 34 x 4 inches front and rear and the equipment practically the same as in the larger cars, including electric lighting and starting.

The specifications of models 32 and 33 are alike, except that in the former the body is a five-passenger touring and in the latter a roadster. The motor, formerly of 4 inches bore and 5½ inches stroke, now has a bore of 4¼ inches and a 5¼-inch stroke, the cylinders being cast en bloc and having the valves all on one side. Ignition is by dual system, with magneto and dry cells. As in all the other cars, the unit power plant system is employed and a multiple disk clutch drives to the centrally controlled three-speed selective gearset. The full-floating rear axle has a malleable housing, 1⅜-inch chrome nickel shafts and roller bearings; the final drive ratio is 3½ to 1. The wheelbase is 114 inches.

Both the front and rear tires are 34 x 4 inches. The equipment is practically the same as in the bigger models, not even omitting the electric lighting and starting, and the same black finish is standard with the small cars as with the more powerful machines. The price is $1,500, an increase of $215 over the former figure.

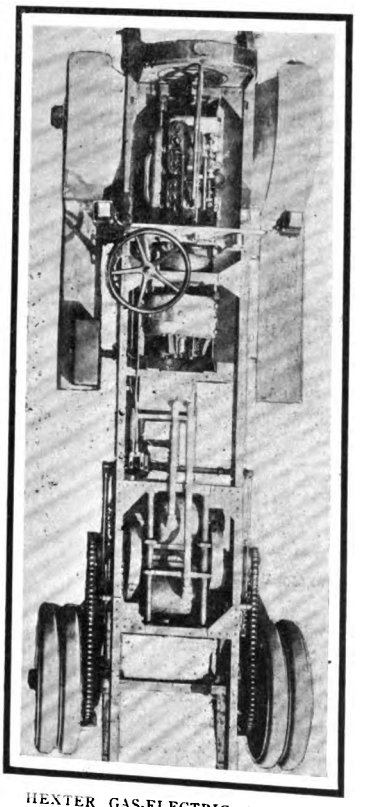
HEXTER GAS-ELECTRIC TRUCK WITH SIMPLIFIED CONTROL



Clutch, Gearset, Bevels and Differential Eliminated—Driver Can Walk Beside Car and Control Power by Hand.

There are a few things that the good old horse will do that make him more useful in certain lines of human endeavor, such as peddling milk and ice, than the motor truck. For instance, the horse will "learn the route" and make the proper stops without prompting from the driver; or, if the beast is less experienced, the driver can walk beside the wagon. While it does not seem within the bounds of probability that a motor truck ever will "learn the route," a machine already has been evolved that can be driven from the sidewalk, to a certain extent, so that for moving short distances the driver can walk along beside the slowly rolling car with his hand on a lever which automatically returns to neutral when released and stops the machine.

The truck which includes the sidewalk control feature is equipped with an electric transmission system and is the Hexter truck, built by the Hexter Motor Truck Co., of New York. Its outward appearance is that of a conventional motor truck with the motor under a hood and with final drive by side chains. The transmission, however, is decidedly unconventional, though it is by no means new in principle or in general design. The engine is direct connected to a 7½ kilowatt generator and the current produced is led to two motors, one driving to each of the jackshaft sprockets through heavy spur gearing. There is no differential, the shaft being in two entirely separate parts, each carried on large ball bearings; the gears are placed between the bearings so that the stresses are distributed to the best advantage. The motors, though comparatively light and compact, have a high overload capacity and are peculiar in that they show high efficiency in the overload range, in which they differ from most motors, which are most efficient at normal outputs.

The control system and the way in which the car "handles" are the most striking features. There is no gear-shifting lever, of course, and as the time of ignition is fixed there is no spark lever. The throttle is controlled by a pedal, the service brake by another pedal; the emergency brake by the usual lever and the controller by a handle. The controller has two speeds forward and a reverse position. The highest speed is the ordinary running speed, the motors being in series-parallel. The lower speed throws the motors into series for extraordinarily hard pulling. It is stated, however, that the machine will handle an overload on almost any grade on the higher speed.

With the controller in the high speed position and the throttle closed until the motor turns over at less than 300 revolutions per minute, the current from the generator is insufficient to drive the truck, which can be left standing ready to move at a touch of the throttle pedal. It is this feature that makes it possible to control the car while walking along beside it, for

HEXTER GAS-ELECTRIC CHASSIS

the throttle pedal can easily be operated by hand. There is no such thing as jerking or jumping in starting the car or progressing from a lower to a higher speed. Acceleration is gradual, though rapid if the throttle is rapidly opened, and directly proportionate to the engine speed. By virtue of their electrical characteristics, the generator and the two electric motors automatically compensate for changes of load due to changing road and other conditions, so that the whole control of the truck is accomplished through the foot throttle except on the rare occasions when the controller must be thrown into the low-speed position. A very few minutes is sufficient to enable anyone to learn to handle the car, so far as the manipulation of the controls is concerned.

The normal rated capacity of the truck is 4 tons, but so great is the margin of safety that a 50 per cent. overload, or 6 tons, can be handled up and down hill with the greatest ease, it is claimed. The maximum speed, which is governed, is 12 miles an hour. The weight of the truck is the same as the weight of its normal load, or 8,000 pounds. The construction is substantial, as is indicated by the fact that the main members of the frame are of 7-inch channel steel. The wheelbase is 13 feet, the overall length 20 feet, the front tread 62 inches, rear tread 65 inches, and turning circle 44 feet. The front wheels are fitted with 37 x 5 single tires and the rear wheels with 41 x 5 duals. There is very little wiring, and what there is can be handled without fear of making mistakes in replacing, because of the careful system of tagging which makes proper connection a comparatively simple matter.

Why the Engine Refused to Fire.

The top of the magneto is no place for the young of the cat; the kitten ought to have known better than to choose such a resting place, but it didn't, and thereby hangs a tale. It is told of a motorist who did his own tinkering that after finishing a job in his own garage he repaired to his bed, leaving the engine hood up. In the morning he attempted to start his engine with but mediocre results; she missed fire badly. After he had got it to run, he heard a plaintive cry from somewhere in the internals of the engine that suggested no mechanical fault he had ever heard of. So he lifted up the hood—and found the kitten sitting on top of the magneto. Hence: When starting a motor, always remove the kitten from the top of the magneto.

San Francisco Fixes Taxicab Rates.

Emulating other cities which have legislated regarding taxicab rates, San Francisco has fallen into line with a maximum fare charge and considers making other restrictions later; the new ordinance states that 75 cents shall be the maximum charge for one or two passengers, with an additional 25 cents for each extra passenger, in the railroad, ferry and hotel district. The district is described as: Market and 5th to Howard, to 4th, to Townsend, to 3rd, to Howard, to the Embarcadero, to Broadway, to Sansome, to Bush, to Taylor and back to Market and 5th street.

Planning to Make Cars in Japan.

Efforts are being made to establish an automobile factory in Japan; the tentative corporation, located in Tokyo, is styled the Oriental Automobile Joint Stock Co.

MANAGERS ENTRENCHED BEHIND STONE WALLS

Broadway Dealer Who Began When the Trade Was Young Says Managers Should Be More Accessible to Public—Calls That His Greatest Asset—Instances Where Such Walls Have Kept Trade Away.

"Get-at-ability" is advanced by motor car manufacturers as an attribute of the motors and other parts of their cars.

"Get-at-ability in managers" is considered equally as important, if not more so, by A. J. Picard, who deals in supplies and accessories as A. J. Picard & Co., at 1740 Broadway, New York City, and who is one of the veterans of the trade.

When one enters Picard's store he sees on either hand the showcases of goods; at the rear of the store, through an ever-open door, he sees Picard. If he wants to see Picard he walks in and sees him, and doesn't have to run the gauntlet of a young army of hall boys and stenographers to do so. Picard is "get-at-able," and to this fact more than to any other he attributes what measure of success he has obtained in his business life—as a dealer, first in cars and for the last two years in accessories and supplies.

The Open Door His Greatest Asset.

"I believe that is my biggest asset," he said to a Motor World man who walked in a bit timorously, half expecting to see a hall boy or stenographer bob up from somewhere and block the way, as they had on many previous occasions in other establishments. It was a more or less novel experience, and in explanation Picard continued, "To the fact that no man who wanted to see me ever had to give his pedigree before he could find me I attribute what success I have attained. If a man wants to see me, it has always been a rule in my business that he could see me. If he calls on the telephone and asks for me he gets me, and he doesn't have to give his name, address, telephone number and number of times he has been married before I answer. If I don't want to talk with him I can conclude the conversation in a very short time, but in any event he gets me.

"Many times I have come all the way down from the third floor, when I was selling cars, to see a man who had asked for me. No one demanded his pedigree and asked if some one else wouldn't do; they sent for me. Nine times out of ten it probably was a chauffeur looking for a job, but if I got one good one out of the ten, wasn't it worth it? And, if I didn't want to talk with the man I could get through with him in a very few minutes. Being called down nine times to see chauffeurs who want jobs is irritating—but the pay for the irritation comes on the tenth time."

Public Manager's Market and Master.

Picard entered the automobile industry when it was very, very young—away back in 1899. He sold a French car and did well at it, and is one of the trade's purple seal graduates of the School of Hard Knocks. Picard reduced the whole proposition to small proportions when he said, "The manager is the people's servant, the public is his market, and he should act accordingly."

"Too many managers in the automobile trade to-day," he continued, "are building stone walls about themselves. No one can get to them, in person or by telephone. I know whereof I speak from my own personal experiences. Whenever I sold a car it was always a hobby of mine to find out, if I could, why the man bought my car and not some other.

"One day a man walked into my salesroom and asked about the car I was selling. He looked it over and finally I suggested that we drive through Central Park and get a drink; I didn't ask him if he wanted a demonstration. We hadn't been out long when he pulled out of his pocket a check made out to the P—— Motor Co. and dated that very day. He said he had wanted one of those cars badly, but that when he went in that day the manager was upstairs and wouldn't come down to see him. The man, right in front of me, tore up that check and bought my car. All that lost the sale for the other dealer was that the manager wouldn't come down stairs.

"Another man, who had owned P——s for years and who swore by them, came in one day and, after looking at my cars, asked if I could let him have a limousine right away. I told him I could. Then he said he wanted a touring car, also. He also turned over to me his three P—— cars to sell. He had been on the point of buying another of that make, but when he went up to see the branch manager the manager said he couldn't see him that afternoon but would see him in the morning. He hasn't seen him yet, and that was several years ago.

Where "Cussing" Secured Audience.

"And just to show you how busy some of these managers are who can't find time to see a man: I had fixed up a difficult and nasty matter for a company whose sales offices are here in town and had arranged for them to get their pay for an electric system. I thought they would be glad to know about it, so one day I dropped in at their offices and asked to see the manager. The office boy said he was busy and couldn't see me. I'm a Frenchman, and just then I began to cuss a little. I told that boy that —— ——— when they wanted to see me ——— —— they could come down to my office.

"Just about that time the manager opened the door of his office and rushed out. He grabbed me by the arm, rushed me in,

Digitized by Google

made me sit down and gave me a cigar. There wasn't a soul in the office with him and, so far as I could see, he hadn't been very busy, but I suppose he was upholding the dignity of his position.

"I frequently find it possible to help some of the dealers and branches to make a sale or two; I have assisted in making quite a few sales since I have been in the accessory business. Two friends of mine came in some time ago and wanted me to see what I could do for them in the way of new cars. Each of them had the money in his pocket and was ready to pay cash. I called up two dealers. One manager was in conference and the other was busy. The telephone girls in both places said the managers would call me up. Maybe they will, but I'm beginning to lose hope, for that was six weeks ago and I haven't heard from them yet."

Selling Rules in Picard's Store.

All of these experiences have had their part in formulating the rule that anyone who wants to see Picard sees him. Coupled with this are one or two other admonitions which constitute the only rule of selling that prevails in his store. That is: "Always be polite; see everyone who comes in, and pay just as much attention to a seedy suit of clothes as to a silk hat." And these things, too, are the result of 14 years in the trade.

"Old clothes shouldn't mean much to an automobile salesman; some of the wealthiest men in New York aren't over-particular about how they dress," he continued. "I got my first real lesson in that matter years ago when the cars I imported sold for $11,000 apiece. One day a man came in and began to ask about the cars. You could have bought his hat for five cents, his shirt for seven and a half and his tie for not more than three, but he talked with considerable mechanical intelligence and finally I took him out for a ride.

Rusty Suit Held a Check for $5,000.

"I took him up as far as 125th street. That was as far as he wanted to go; he said, 'I'll take two of these.' I thought he was crazy, as sure as fate, but as long as he didn't seem dangerous or threaten to shoot me, I thought I might as well take him back to the salesroom. When we got there, he said, 'I'll pay $5,000 deposit on these cars,' and reached in his dirty old vest pocket and pulled out a little bit of a check, made it out to me, and asked when I could have the cars ready. I told him within four days. He said he would be back in that time to pay the balance.

"I thought it was a joke and laughed when I showed the check to my salesman. But the next morning I told the salesman to take the check down to the bank and see what they would do with it. When he came back the salesman didn't even wait for a street car; he ran all the way and burst into the salesroom yelling, 'It's good! It's good!' The rusty looking man was the chief engineer for ——, the candy manufacturer, and men associated with him later bought 11 more of my cars.

Flashy Suit That Did Not Hold Check.

"I never was able to learn for certain—to have asked the man would have been an insulting question—but I always suspected from the way he acted that he had gone into some salesroom somewhere and gotten a rather chilly reception because he happened to have on a seedy-looking suit of clothes. I have always believed in being impartial in my treatment of people, but after that I made it my particular business.

"But it works both ways," laughed Picard. "One Saturday afternoon a swell-looking brougham drove up; there were all sorts of trappings on the horse and it was quite a turnout. Of course, those things can be rented, but this was a good imitation of the real thing. The young man dismissed the outfit, looked a car over, said he was stopping at the Waldorf and that if it would take him to Stamford and back he would buy it. He asked me to call for him at the Waldorf the next morning—a Sunday. I did so, and took him to Stamford and brought him back.

Prosperous Prospect a Shirt Clerk.

"He said that if I would call at the hotel the following Tuesday he would take the car and pay me for it. The following Tuesday I called at the hotel, but they said they never heard of such a man. Some weeks later I was passing Wanamaker's and I saw a silk shirt sale advertised. I went in, and there was my prospect behind the shirt counter. He tried to explain, but I said, 'You win, you win,' and bought some shirts."

One thing which is taboo in the Picard establishment was and is "knocking." "You often hear of the bad results of 'knocking,'" Picard said, "but not always do you get a concrete instance. But one day a man came into my salesrooms and said, 'I don't want to buy, I just want to look at the cars.' I volunteered to explain anything he wished explained. He finally said he had been over at the D—— salesrooms and that they said so many bad things about my cars that he just had to come over to see what kind of a thing I was selling. The result was that he never went back to report to them the result of his investigation. He bought of me."

Picard also maintains that no manager can lay down the law to a salesman as to how to sell cars, for every prospect is different. The salesman's biggest asset is tact, he says; he must study his prospect, learn the line of talk that the prospect wants and hammer him along those lines. And he shouldn't do what so many do and talk so long that he unsells the car after it is sold.

As to prospect report cards and follow-up systems, Picard doesn't believe very strongly in them. "I never made out one of these prospect pedigree cards and I never asked a man of mine to do it," he asserted. "Some of them are worse than the Bertillon system in the Tombs. It disgusts a customer to have a salesman ask him his name, address, telephone number, business, how many wives he's had and what his father's religion was. Some of those things the salesman may be able to find out through the use of tact, but even then the buyer of a high-priced car won't stand too much follow-up. If a man didn't want to be followed up I used to let him alone."

Oldtime Wrinkles That Are Still Good.

What used to be of importance in the earlier days was that the dealer be sure the cars on the floor would start easily and run and Picard suggests that it is not a bad plan at the present time to be sure the difference in climate between the factory and the salesroom, and other things, have not affected the car.

The electric starter, he stated, has made starting so easy that dealers often neglect to make sure their cars will keep running after the starter has set them going and sent them off the salesroom floor. Making sure of these and other things, he says, can do no harm and may do a world of good.

In regard to the accessory trade he states that an improvement could be made were the manufacturers not to give the same discount to rate-cutters and "fly-by-nighters" that they do to established dealers.

Battle Creek Regulates Horn Toots.

It may be necessary to get steamboat captains for chauffeurs in Battle Creek, Mich., if the present force of drivers finds itself unable to master the new code of toots and blasts which has been promulgated for use as traffic signals; anyway, it is a safe bet a steamboat captain would feel right at home in the fanfare of horns. The code states that one long blast shall be used to attract the attention of pedestrians; one short blast shall mean "Turn to the right"; two short blasts, "Turn to the left"; three short blasts, "Slow down"; four short blasts, "Back up"; two long blasts, "Straight ahead." When the drivers get those memorized they will be in condition to mastera really complete code of signals.

NEBRASKA MEET SHORTENED BY MENENGHETTI'S DEATH

Tragedy on Half-Mile Track in First Day's Program Causes Abbreviation—Morris Shows the Way to Home Talent.

Louis Menenghetti, who during the last three years made quite a name for himself, not so much because of his ability to win as of his intention to win, meet promoters and the hippodrome "stars" notwithstanding, drove his last race on Wednesday, September 17th, at the first day of a three-day racemeet which was part of the program of a fall festival held at Norfolk, Neb. The Italian's Fiat skidded while he was endeavoring to negotiate one of the sharp bends on the half-mile dirt track at high speed and turned turtle, pinning the driver underneath when it brought up some 40 feet from the side of the track. Lombardi, the mechanician, escaped with a violent shaking up, but Menenghetti was instantly killed.

The race was the second number on the program, a pursuit event in which there were but two contestants, Menenghetti and Gaston Morris at the wheel of a National. Menenghetti had made three circuits of the course when the accident occurred. Morris was flagged immediately and the remainder of the first day's program was called off by the management.

Menenghetti was to have been the "star" of the meet, not another of the contestants, saving Morris, having been heard of outside of Nebraska. The Italian was playing in the leading role at the time of the mishap, having won the first event, an obstacle race, which went for five miles, in 8:05, leading home Milton, who drove a Mercer.

Interest in the speed carnival petered out after the mishap, so that on the second day of the meet but two events were run. Both were free-for-all events and both were won by Morris at the wheel of a National. On the third day, Friday, September 19th, but a single event was run, and that was not completed. It was a single mile time trial and Morris succeeded in rounding the course in 1:17⅖, which may or may not be a record for the course, but was hailed as one nevertheless. But when Milton, on a Mercer, attempted to emulate Morris's performance, he skidded in a manner similar to Menenghetti at about the same spot, and when his machine brought up it was minus a rear right wheel. Luckily the machine did not turn turtle, however, and the driver and mechanician were not thrown out of their seats in the car. The incident was depressing and the meet was called off, however. The summary:

Wednesday, September 17.

Five-mile obstacle race—Won by Louis Menenghetti, Fiat; second, Milton, Mercer. Time, 8:05.

Pursuit race—Called off after third lap, when Menenghetti met with accident.

Thursday, September 18.

Five-mile free-for-all, run in three heats—Final heat won by Gaston Morris, National; second, Book, Studebaker; third, Williams, National. Time, 7:50.

Ten-mile free-for-all—Won by Gaston Morris, National; second, Williams, National. Time, 15:06.

Friday, Septmber 19.

One-mile time trials—Gaston Morris, National. Time, 1:17⅖. Called, and remainder of program cancelled, when Milton skidded.

Boillot Takes Boulogne Grand Prix.

Adding another feather to his cap, Georges Boillot on Saturday, 21st inst., led home the field in the Grand Prix race for light cars that was run over the Boulogne circuit in France; he piloted a Peugeot car and his time for the 300 miles is given in cable despatches as 6.07:00. Goux, who took first honors in the annual 500-mile Sweepstakes race on the Indianapolis Speedway Decoration Day, was second, at the wheel of another Peugeot, in 6:17:00; and Guinness, in a British Sunbeam, was third in 6:18:00. The driver of the Buick entry struck a post-man and was wrecked. The weight limit was 1,980 pounds.

Moross and Troupe Visit Fort Wayne.

With a slightly varied program, including by way of diversion a race between a chariot drawn by a couple of horses and Burman in a big Benz, E. A. Moross and his performers trooped over into Fort Wayne, Ind., on Sunday, 21st inst., and furnished the last act for the County Fair, as he has furnished the last act for other county fairs. Needless to add, Burman was the whole show, not one of his "rivals" scoring a point. His best time was made in a one-mile time trial, the circuit of the dirt track being made in 50 seconds flat.

40-Mile Road Race Goes to Banks.

The winner of the 40-mile road race run by the Hibbing (Minn.) Automobile Association on Saturday, 21st inst., from Grand Rapids, Minn., to its home city, turned up in Frank Banks, who piloted a Velie across the finish line in 1:04:30; Fred. Smith, also at the wheel of a Velie, was second, in 1:05:18; William Messner was third in 1:07:56. A proposed track meet was abandoned.

OLDFIELD AND BURMAN VIE IN SETTING UP "RECORDS"

Each Gets One on Detroit Track in Spite of Existing Figures—Chandler Assaults the Fence in Five-Mile Event.

Rain spoiled one day of the two days racing that was scheduled to wind up the Michigan State Fair at Detroit—the program for Saturday, 20th inst., was abandoned—but time still remained on Sunday afternoon for Disbrow and Oldfield both to establish new "world's records," and this they proceeded to do—at least, according to the announcements that were made by Alex. Sloan, Esq.

Oldfield's "world's record" was made in a one-mile dash around the track in the old Christie front drive car, the clockers catching the flight in 49.40 seconds, which is something faster than 46⅗ seconds, according to those who made the comparison. Disbrow, who previously accounted for the five-mile Class E event, took his turn at shattering records in the five-mile free-for-all handicap, beating the field in 4:25.25, and though he himself drove the same distance last year in Cleveland in 4:06.58, he permitted the new time to be announced as a "record."

Aside from the establishment of "records," one accident served to increase the excitement of those who crowded the grandstands. Chandler, who had won the ten-mile race, swerved through the fence in the last event, and though his car was badly smashed and part of the fence was irrevocably ruined, he escaped with bruises. The summary:

Ten miles, class E, 300 inches and under—Won by Wm. Chandler (Mason); second, Ed. Rickenbacher (Mason); third, H. Ullbrecht. Time, 9:25.85.

Five miles, class C, 301-450 inches—Won by Rickenbacher; second, Ed. Hearne (Case); third, Endicott (Case). Time, 4:54.54.

Five miles, class E, 600 inches and under—Won by Louis Disbrow (Simplex); second, Rickenbacher; third, Endicott. Time, 4:38.56.

One mile time trials—Won by Barney Oldfield (Christie), time, 49.40; second, Disbrow (Simplex) ,time, 50.81; third, Endicott (Case); time, 52.31.

Three-mile novelty, two miles run, wheel changed and third mile run—Won by Hearne; second, Endicott; third, Rickenbacher. Time, 3:31.11.

Five miles, class D, free-for-all, handicap—Won by Disbrow; second, L. Heineman (Case); third, Hearne. Time, 4:24.25.

SETS DAY FOR DEDICATION OF THE LINCOLN HIGHWAY

Association Selects October 31 as Day for Celebration Along Whole Route —Parades, Red Fire and Oratory Part of Plan.

Having launched its campaign of promotion of the Lincoln Highway, the Lincoln Highway Association now plans to dedicate the ocean-to-ocean road to the martyred President after whom it is named and has designated October 31 as the date for the dedicatory celebration. Not only the big cities, but every little village and hamlet on the route is expected to play a part in the ceremony.

On the night of October 31, just after darkness has fallen, the belt which will be traversed by the highway in its transcontinental course will be a stretch of light and noise, for, except for time belt differences, the celebrations will occur simultaneously. All along the route will be held torch light parades, men will march, motor vehicles will parade, orators will dilate upon the project and moving picture plays will demonstrate what can be accomplished through modern methods of road improving.

The program includes the decorating of the route with flags and bunting, and not only will automobiles and their owners and others interested in the trade take part, but the entire population along the route is scheduled to join in, for the Lincoln Highway is to be open to all traffic, with no tolls.

At the many meetings which are planned to be held, the promoters of the road will broach the changing of local designations for the highway and the adoption of the name which has been officially chosen by the association. If the route which lies through Marshalltown, Iowa, happens to be known as somebody's turnpike the suggestion will be made that that name be dropped and that "Lincoln Highway" be applied to the road.

The first of the markers which are to be used in designating the highway was placed September 15 at Clinton, Iowa, by W. F. Coan, president of the Clinton National Bank and Iowa State Consul for the Lincoln Highway Association. Other consuls have been appointed to receive the five-dollar contributions which the association is soliciting from the public generally and in exchange for which contributors' certificates are issued. Some of those already named, besides Coan, are:

Payson W. Spaulding, of Evanston, for Wyoming; E. P. Brinegar, chairman of the Lincoln Highway Committee of the San Francisco Chamber of Commerce, for California; H. O. Smith, president of the Premier Motor Mfg. Co., of Indianapolis, for Indiana; F. E. Edwards, of the Chicago Automobile Club, for Northern Illinois; C. L. Newcomb, Jr., chairman of the Lincoln Highway Committee of the Denver Chamber of Commerce, for Colorado; H. E. Frederickson, of Omaha, for Nebraska.

Following the dedication of October 31, which is a Friday, dedicatory sermons will be preached in churches along the route. The school children have their part in the great work mapped out, too; when Arbor Day comes they are to plant trees along the roadside to afford shade for the body of tourists of which the little ones may be a part by the time they and their trees attain maturity.

Savannah Does not Admit Defeat.

Despite repeated reports to the effect that the Vanderbilt and Grand Prize races were all but off, Harvey Granger himself, president of the Savannah Automobile Club, stated to a Motor World man yesterday that such is not the case. Granger went even further and put himself on record as saying that the races would not only be started but that in all likelihood there would be at least 12 cars, and possibly 15, at the starting line in both of the races.

Two entries already are in hand and paid for—both of them of Mercer cars—and negotiations now are pending which probably will result in the entry of three Peugeot cars, according to Granger, and it is expected that if these entries really are made Isotta-Fraschini, Stutz, Mason, and Bergdoll Special entries will follow immediately. But unless manufacturers and others can overlook the necessity for paying their entry fees and the freight on the cars and, waiving their requests for rebates, get their entries in the hands of the club before October 5th, both races will be abandoned. Although there has been some talk of staging the races on an eight-mile course in the vicinity of Trenton, N. J., it appears extremely unlikely that there would be time before the snow flies to get things in readiness in case the Savannah Automobile Club should abandon the contests.

Names Committee to Prevent Accidents.

The frequency of accidents in Chicago, caused by automobiles, street cars and railroad trains, has led Coroner Peter Hoffman to select a Public Safety Committee of 25 members with the object of lessening the number of accidents; the committee will investigate the situation, recommend remedial measures and will inaugurate an educational campaign for the instruction of the public in traffic affairs.

ENTRY LIST OPENED FOR 500-MILE SWEEPSTAKES RACE

Entry Fee Cut and Rigid Inspection of Steering Gear and Other Car Parts and Drivers Required—Prizes Remain the Same.

Although previous entry lists have not been declared opened until after January 1st, the entry list for the fourth annual 500-mile Sweepstakes race which is to be held on the Indianapolis Speedway, May 30th, 1914, already has been hung up and entry blanks are being mailed to the four quarters of the globe. In them there are several important changes from previous practices, most prominent among which is a reduction of the entry fee from $500 to $200, with the stipulation that half of this fee be returned in the event that a car actually starts in the race.

Furthermore, it is stipulated in the entry blanks that all steering knuckles and tie rods must be new two days before the contest and that aluminum steering wheels will not be permitted; all steering connections and frame hangers are subject to the approval of the Speedway engineer, and cars failing to meet with his approval will not be permitted to start. Similarly, drivers who cannot pass the examination of Dr. H. R. Allen, the Speedway surgeon, who will issue a certificate of their fitness, will not be permitted to start.

As was the case at the last race, cars having engines of less than 450 inches piston displacement only will be eligible, and they must not weigh less than 1,600 pounds; they must be capable of a speed of 75 miles an hour for a complete lap of the 2½-mile oval. Prizes are the same, $20,000 going to the winner and $30,000 being divided into nine other prizes for the next nine men to cross the line. In addition, the Wheeler & Schebler cup, the Remy brassard and the Prest-O-Lite silver brick will be put up again.

In preparation for next year's race, a new grandstand, to consist entirely of boxes, now is being put up; it will be a twin to the present paddock stand. Another stand, 500 feet long, will be put up on the straightaway stretch, increasing the seating capacity by 18,000. At the same time, water supply mains will be brought from Speedway City, across the way from the track, for fire protection.

Evil Results from Riding Rails.

The practice of running a car with the tires in the grooves of street car rails is said to be injurious in that it ruptures the fabric inside, where the damage is not visible.

DEVICE MAKES TOP RAISING EASY TASK FOR ONE MAN

Both Sides Go Up When One Side Is Lifted—Effective in Lowering as Well as Raising — Appliance Small and Simple.

One of the jobs that nobody likes, yet one that has to be done more or less frequently, is the raising and lowering of the top of the car; and the bigger the car the more disagreeable the job, under ordinary conditions. In fact, it is not an unusual thing for "all hands" to take hold and help along the erection of the covering.

It is with the idea of eliminating the more unpleasant part of the top-handling task that the Simplex Specialties Co., of Detroit, offers Green's top lifter. It attaches to the lower ends of the bows and guides them into position. The effect is the same as if a man could be on both sides of the car at once, for the lifter duplicates on one side what the operator does on the other side. The bows cannot become jammed or broken, the top cannot slip down and scratch the body of the car and, when not in use, the device is detached and stowed away, requiring almost no room for stowage. In lowering the top the lifter is equally effective; and the top can be either raised or lowered by one man without disturbing the occupants of the machine.

TWO VIEWS SHOWING METHOD OF APPLYING GREEN TOP LIFTER AND OPERATION OF THE DEVICE

"Astra" System of Carbon Removal.

The sound principles which underlie the oxygen system of removing carbon from the cylinders and piston heads of gasolene motors, and the satisfactory results which have attended its use, have made the manufacture of apparatus especially adapted to the work one of increasing importance. The decarbonizing of a cylinder is effected by projecting a jet of pure oxygen upon the carbon through a flexible nozzle inserted through a valve port or a spark plug hole and starting combustion with a lighter, taper or a match. The carbon is burned away, combustion being supported by the oxygen, and passes off as a gas, leaving the metal surfaces absolutely clean

As the tanked oxygen used for the purpose is under very high pressure—approximately 1,800 pounds to the square inch—it is necessary to employ a reducing valve and other fittings properly designed for the work, if continued satisfactory results are to be obtained. The "Astra" apparatus that has been developed by E. Raven Rosenbaum, of 603 West 43d street, New York, is built along lines that are the result of long experience in the handling of high pressure gases, and is simple in construction, effective in operation, and durable.

A complete decarbonizing outfit consists of the reducing valve—which, incidentally, is the most important of the mechanical parts—a specially constructed pressure gauge, 10 feet of high-pressure hose and the torch, which latter is simply a special form of needle-valve with a flexible copper tip which can readily be replaced after much bending and twisting have impaired its usefulness. All connections are made by means of ground joints. The oxygen tank to which the reducing valve is attached is loaned, without charge, for a period of 30 days, the only charge being for the oxygen; after 30 days a small rental charge is made. Empty tanks are exchanged for charged ones, the user paying for the oxygen only. The list price for the complete outfit is $35 f. o. b. factory. The standard tank contains 100 cubic feet of oxygen, which costs 2 cents per foot, or $2 per tank. The tank weighs 130 pounds and the balance of the outfit but a few pounds.

PREVENTING OTHERS FROM WALKING OVER YOUR HEAD

Accessory Company Advises Employes to Make Selves Bigger than Their Jobs—Says "Employer is from Missouri, Show Him."

Once upon a time, so it is said, a government employe at Washington was joked by a superior officer because of the employe's shining head, upon which there was scarcely a hair.

"No wonder," was the rejoinder, "with so many men walking over my head."

He was long in the service and faithful, and to give the story its "lived happy ever after" ending, he secured a promotion.

"Letting the other fellow walk over your head" is the latest topic in the series of short talks which the Weinstock-Nichols Co., accessory dealers, of San Francisco, Oakland and Los Angeles, is distributing in printed form among its employes, and had the old government employe had one of these little sermons slipped into his hand long before he might have preserved his hair. The advice, which urges the employe to demonstrate his worth before expecting advancement, says:

"You perhaps have met the employe who has said, 'You don't catch me doing any more work than I have to for the pay that I am getting. If the "Boss" wants more work he will have to pay me more money for it.'

"You doubtless have also seen this sort of an employe, as a rule, stand still, or worse yet, lose his job while younger workers have walked, so to speak, over his head to better positions with better pay.

"Employers the world over rarely, if ever, pay out more money to workers on mere

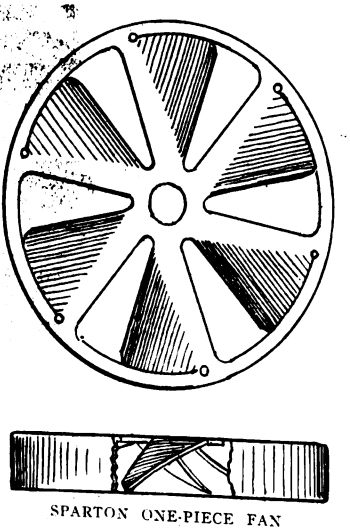
Digitized by Google

prospects. Employers are like Missourians —you must first "show them."

"The salesman, for example, can only hope to earn more money until he proves to his employer that he is worth it. The only way he can prove this is by his work, by doing it at least a little better than others can do it; in this wise, making his results do the talking for him.

"Every stroke of work one does, every sale that a salesman makes during every hour of the day goes to make for him a record. Sooner or later this record comes up for review. The future of the individual depends upon what this record tells. If it tells, for example, that he is slow, lazy, indifferent or inefficient, he will be rated and treated accordingly. He will hold his job by a slender thread that is liable to snap at any time. If, on the other hand, his record tells that he is quick, faithful, reliable and efficient, this will do more for him than all that he can say for himself by word of mouth. It will give him a strong grip on his job, and if the work he is doing is worth more money, sooner or later he will get it.

"Your aim as a worker should be to fit yourself for better and higher things, even if these better and higher things are slow in coming. Make yourself ready for them when they do happen along. Make yourself bigger than your job. Fit yourself for a higher place and for greater responsibilities. Make yourself worth more money, even if the money should not come as fast as you hoped it might. As a salesman, give the customer in the way of intelligent service the best there is within you. Remember that the business world is just as hungry for efficient workers as it is for new customers, because it is the efficient worker that, as a rule, will lead to getting new customers.



"Start out with the feeling that there is a lot of good stuff in you and that it is for you to bring it out. Let your highest qualities blossom and flower for your good, for the good of the business and for the good of the customer, and you will seldom go hungry for the want of a job and rarely find yourself out of the line of business growth and progress."

Graphite for Metal-Cutting Tools.

One of the curious uses to which graphite is put is the lubrication, if the term may be used, of lathe and other metal-cutting tools. The graphite is mixed with water and the water run over the point of the tool, just as oil is used under similar conditions. The graphite itself is so finely divided—or "de flocculated," as the makers express it—that it does not seem to feel the effects of gravitation but remains suspended in the water indefinitely. It is so fine that it will pass, with the water, through filter paper. Incidentally, no little difficulty was experienced when first the attempt was made to mix water and graphite, for the fine powder could not even be made wet, absolutely repelling the water. The difficulty was overcome by the use of a solution of tannin, which had the effect of making the powder wettable, so to speak, and assisted in causing it to remain indefinitely in suspension in the water.

Sparks-Withington Adds One-Piece Fan.

Not every one knows it, but despite the fact that casual inspection coupled with a merely superficial knowledge of the action of centrifugal force should make the fact plain, the fan that induces a draft through the radiator and helps dissipate the heat stored up in the cooling water, is subjected to considerable strain because of its rapid

SPARTON ONE-PIECE FAN

rate of rotation. Hence, it is absolutely essential that its construction be substantial so that there be not the slightest chance of one of its blades, for instance, or any other part of it, for that matter, flying off at a tangent at some unexpected moment, and not only ruining the fan but endangering both the engine and the radiator as well.

As a solution of this problem, the Sparks-Withington Co., of Jackson, Mich., which has been long and favorably known as the builder of fans of a number of different patterns, just has patented a new design in which the whole fan, blades, rim and all, is stamped out of a single piece of tough steel.

Hence it is impossible for the fan to fly apart at any speed it can be driven by the ordinary automobile engine. Instead of a very thin rim at the edges of the blades, the new fan has a rim 1¼ inches wide which not only effectually protects the blades for the whole of their width but acts as well to deflect the air back over the engine instead of allowing it to be thrown off the ends of the fan blades and to the sides of the hood.

Box Wrench Making Simplified.

There is no reason why anyone who can wield a hammer with a little intelligence should not have box wrenches to fit nuts of all sizes, for the making of a box wrench is by no means a difficult matter. The requisite materials are pieces of heavy steel tubing of the desired length and of inside diameters a shade less than that of the nuts to be fitted, a spare nut of each size for which a wrench is to be made, a hammer and something that will answer for an anvil.

A nut for which a wrench is to be made should be filed so that each of the flats will taper toward the hole, the length of the taper or chamfer being a little less than half the thickness of the nut. Then the tube should be carefully driven over the tapered end of the nut. After a little driving the tube should be hammered over each of the flats and then driven a little more, again hammered on the flats, and so on until the nut is all the way in and the flats are properly formed. Soft steel tubing will stand this kind of "cold forging," but the work may be done a little better and a little easier if the steel is heated to a dull cherry red.

As for the thickness of the tubing, it should be about the same as that used in regular bought box wrenches, though a little more weight will do no harm, and for occasional use for light work even thinner stock will answer.

If it is desired to make a double wrench, to take a nut at each end, the tubing can be stretched somewhat if it is rather heavy, by working it while hot, or else one end may be made for a square nut and the other for a hexagon. Another way is to use two short lengths of tubing of such sizes that one will telescope tightly in the other, and drive them together when the nut-boxes have been formed. Holes for a tommy-bar can be drilled in convenient positions, or a wrench used to turn the box, according to the individual ideas of the "manufacturer."

Mica and Graphite for Inner Tubes.

Powdered talc, the substance commonly used to dust on inner tubes to reduce friction between the tube and the inside of the casing, as well as to prevent adhesion, answers the purpose very well; but it is said that powdered mica and graphite are better and more durable lubricants for the purpose. They are less pleasant to handle, however, which accounts for the common employment of talc.

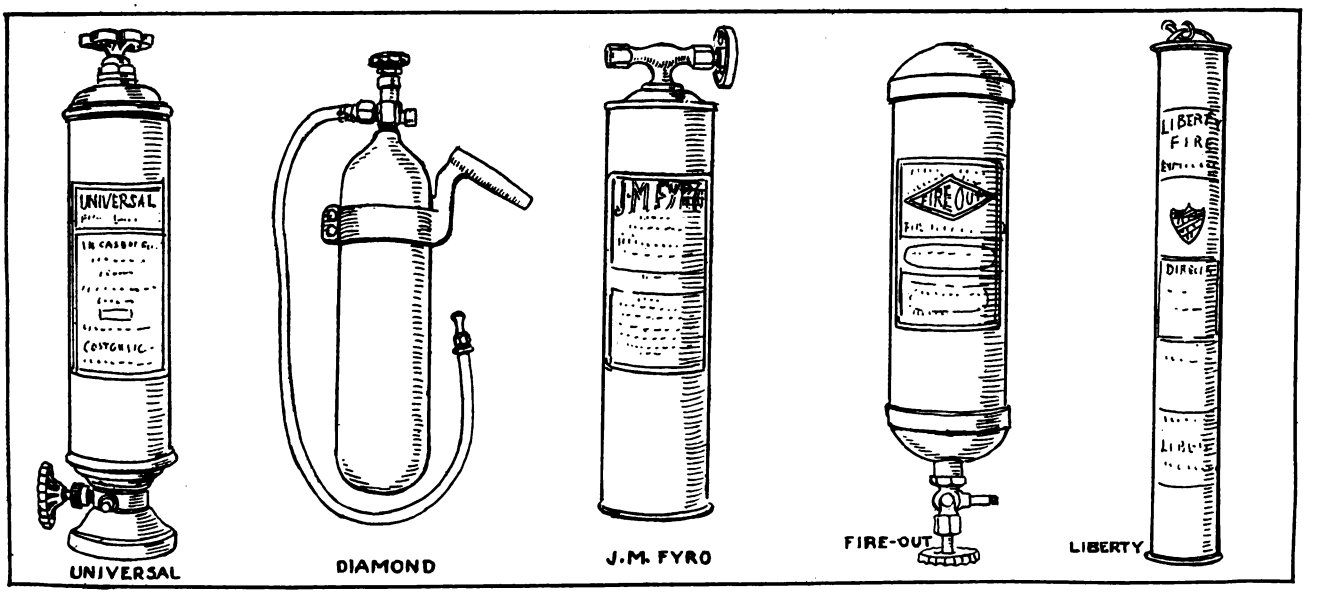
DEVICES THAT DOUSE GARAGE FIRES QUICKLY



Why Water is Useless on Burning Gasolene and the Effect Chemicals Have on it—Smothering Incipient Blazes in the Garage—Some Portable Extinguishers Small Enough to Get Into Action in a Hurry.

"Fire! Fire!" yelled Sanderson, as he shot in through the open doors of the garage with his Klaxon blaring a note of genuine alarm and a faint black trail, steadily growing blacker, following him like a nemesis.

"Hey, Billy!" he shouted at the glass partition between the office and the garage, with Altreuter that time? Why, do you know how long it took me to get the sand out of Altreuter's motor after we got the fire out? I had to take the whole thing down. No, sir! Sand is about the worst possible thing you can use on a fire. It would not have been so bad if Altreuter had stopped his motor before he started warning. What would you do if you were out on the road and a backfire started the 'gas' in your underpan? You'd throw sand on it if there was any sand to throw, and you might put the fire out. But suppose there was no sand? Then what?"

"But——"

"No 'buts'!" interrupted Rea, leading the

FIVE DIFFERENT TYPES OF HAND FIRE EXTINGUISHERS SUITABLE FOR GARAGE OR EMERGENCY USE

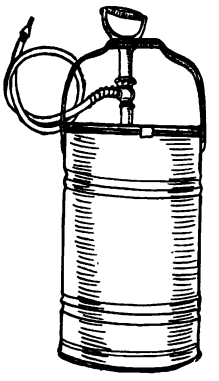
after he had jammed on the emergency and fallen rather than jumped out of his seat, "come out here, will ya? And for the love of Mike bring some sand; never mind your hat"—as Rea reached behind his office door—"you'll find it plenty hot enough in a couple of minutes if ya don't shake a leg."

Rea came out on the run, sized up the situation as a carburetter fire, took one shot through the radiator with a dinky little brass tube that looked more like a tire pump than anything else and stood by and watched the expression of excitement and chagrin on Sanderson's face turn to one of astonishment and happiness.

"Well, well!" he ejaculated, "you're the greatest little fire-putter-out I ever saw, but how the dickens did you get the sand out o' that pump thing?"

"Sand nothing!" replied Rea, with a considerable degree of scorn. "Do you think I'd use sand after all the trouble I had to pile the sand in; but he didn't, and about a barrel of it was sucked through the carburetter and into the cylinders; and when we got the cylinders off the pistons and bearings were in a frightful condition. Never again!"

Necessity for Fire Protection.



"Now, with this thing here," exhibiting a little brass cylinder about a foot long and three inches in diameter, "a couple of squires—p-sst! p-sst!—and the fire is out. Isn't it easy? Nothing to it. It's so easy you'd think everybody would have one handy, but that's the way with you fellows; you never think of fires until you smell smoke; you don't seem to think that you are carrying around with you a tank of stuff that will make the greatest little fire ever, and that it is liable to go up any minute. Of course, it doesn't often go up, but it can go up, and that ought to be your way into his sanctum sanctorum. "I've got a couple of fire extinguishers here and I want to show you how they work. I think it will do you a lot of good; and I think it will do me some good, too, for you are going to be surprised, and if you don't pass the surprise along to your friends I'll be surprised myself. And I'm going to talk pretty straight, too, for some day you will be out on the road with a bunch of smoke trailing you, and you won't have Billy Rea's garage to run into, either."

"All right," answered Sanderson in a resigned tone of voice, as he carelessly chucked a robe over the steam radiator and dropped into Rea's swivel chair, "but if you're going to lecture me, you might as well start at the beginning. Why can't I use water to put out a fire? They say it will merely spread a gasolene fire, but it don't spread any other kind of a fire."

"There you go, showing off your ignor-

Digitized by Google

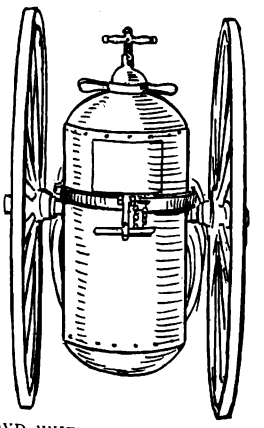
can't use water. Don't you know that gasolene, being oil, is lighter than water and that it will float on water? What happens when you chuck water on burning gasolene? The water scatters the burning liquid. The 'gas' floats on the water and spreads all over the place, and instead of a little fire you've got a great big one. Here's another thing to remember: Every

LIBERTY WATER PAIL PUMP

fire is the same size when it starts; it's the first five minutes that counts in every case.

Peculiarities of Fire Killing Chemical.

"That's why this little extinguisher is so valuable," reaching up on top of his rolltop and taking down the brass cylinder. "You aim it, same as you would a gun—or your finger—give a couple of squirts, and there isn't any more fire. You saw how it works; now I'm going to show you its works. Hold your hand till I give you a little of this 'dope.'"



"Huh!" ejaculated Sanderson, "I know what that is; the wife uses it to take grease spots off my clothes. It's nothing but Carbona cleansing fluid—you-wouldn't-dare-do-this-with-a-match-stuff—that is advertised all over."

"You're right this time, only it is not called Carbona in this case; it's called Pyrene and, as you can see by the label, it's made by the Pyrene Mfg. Co., right here in New York City. And if you were a chemist—now don't rise up; I know you 'took' chemisty in school—I'd tell you it is carbon tetrachloride, for that is what it is, chiefly. There are several extinguishers on the market—I'll show the catalogs in a minute—in which carbon tetrachloride is used, and it is deuced funny stuff.

"In the first place, it smells kind of funny, doesn't it? And it evaporates nearly as quickly as gasolene evaporates. And it does not leave any stain when it's gone; it's harmless—it wouldn't even hurt a white silk dress. But you saw how quickly it puts out a fire. In reality it smothers the fire. Water quenches a fire, but carbon tetrachloride smothers it. Your own chemistry books will tell you—if you have forgotten it—that oxygen is necessary for a fire. Oxygen supports combustion, but it won't burn itself. So if you cut off the oxygen the fire must go out. That's what the carbon tetrachloride fire extinguishers do. As soon as the liquid hits the fire, the heat evaporates it into a blanket of chlorine gas and cuts off the oxygen; answer: Exit, fire. Simple, isn't it?

Fierce Electric Fires Easily Subdued.

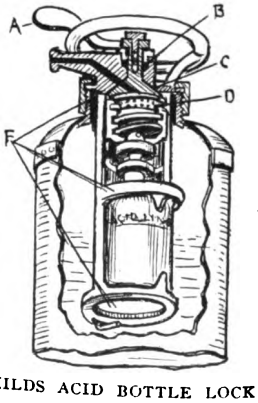
"Is the gas poisonous? Not a bit of it. You can breathe it same as you would breathe air. It won't hurt you a bit. And here's another funny thing about carbon tetrachloride. It's a non-conductor of electricity; it won't short-circuit your wiring. I can take this little Pyrene gun and put out the fiercest electrical fire you ever saw;

BOYD WHEELED EXTINGUISHER

a 2,000-ampere arc has nothing on this little fire gun. I could extinguish that arc lamp up there—yes, right from my chair, here—just as easily as I put out your little piker carburetter fire. What do you think of that? You can't do that with any other kind of a fire extinguisher. And the only reason you can do it with the carbon tetrachloride kind is that the liquid contains no moisture."

"And consequently it won't freeze," interpolated Sanderson; "go on and show me how the thing works—why it squirts."

"That's simple enough. Take a look at this catalog picture (showing the one reproduced herewith). The insides of the thing are just like the insides of a double-acting tire pump and I don't have to tell you how they work, even though you have bought one of my 'elastic hoses.' To start the extinguisher, you turn the handle a little to the left, to unlock it. Then every time you pull the handle or push it, the stuff squirts out. And when it's empty you simply take the top off and fill 'er up again. If you don't use all the stuff on a fire you simply push the handle down and turn it to the right to lock it and the extinguisher is ready for the next blaze.



"The Pyrene extinguisher is not the only one of its kind, of course, though it is the only double-acting one. Just a minute, till I dig up a few catalogs.

Fire Guns That Act Like Tire Pumps.

"Here's one that is a good deal like the Pyrene, though as you can see by the picture here it is not double-acting. Yes, it's made by the Emmons Specialty Co. of Detroit, Mich. The casing is brass—15 x 2½ and weighs 3½ pounds filled—and the 'guts' are too simple to need explanation. At the top where the handle rod goes in there is a stuffing box to prevent leaks. The rod goes clear through the piston, as you can see, and this is so the gun will take up as little room as possible when not in use. To 'fire' the thing, you first pull the handle out and, when you get it out as far as possible, you turn it a little so as to catch the little tab on the end under the tab on the piston. Then when you push the handle down the piston goes with it and forces the death-to-fires out—after you've opened the pet-cock, of course. Expensive? Not a bit of it. You can get that one for about $4.50. Cheap insurance, don't you think?"

"Any more of these here—now—carbon Tetrazinnis?" asked Sanderson, tilting his cigar away from his nose.

"Just a few!" Rea answered. "Here are four more that are more or less alike. This one is the Electrene, made by the Electrene Co.; this one is the J-M Fyro—the J-M, as you may have guessed, stands for Johns-Manville; and this one is the Uni-

CHILDS ACID BOTTLE LOCK

versal, made by the Coston Signal Co. All three of these companies are located in New York. And this last one is the Fire-Out, which is made by the Inst Lighter Co. (it ought to be the Inst Outer company), of Columbus, Ohio. All four of them are filled with carbon tetrachloride and they can all be refilled quite easily.

Digitized by Google

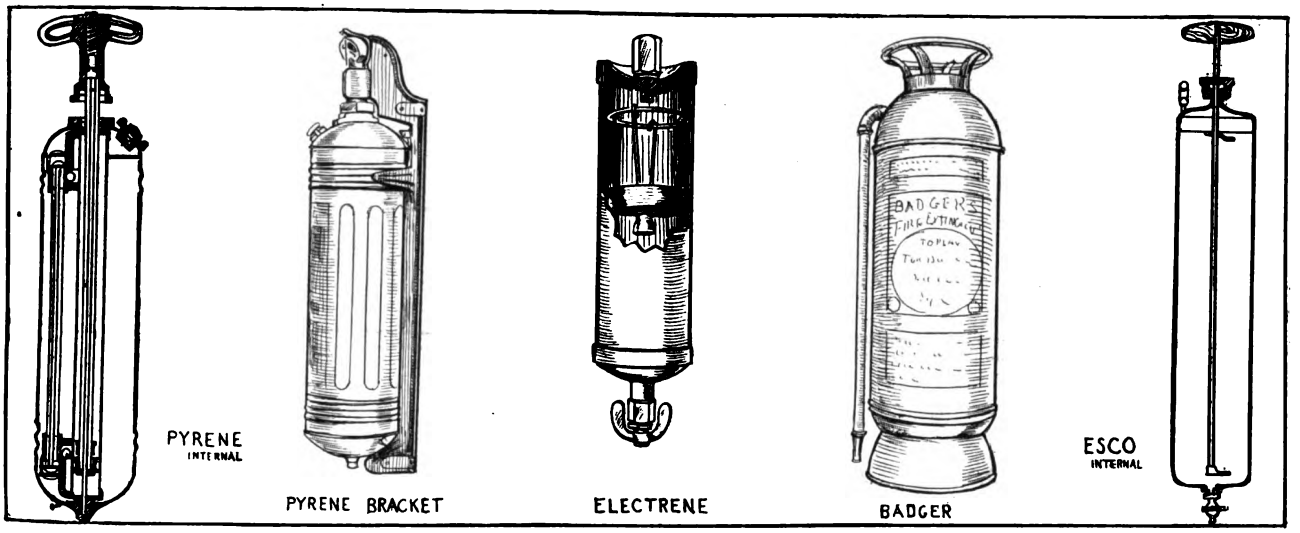
"In three of them the liquid is forced out by air pressure. This part sectional view here will show you how it's done in the Electrene. The outside cylinder is brass and it contains a movable piston supported by a light brass cage. To fill the thing you take off this bottom nut, poke the piston up as far as it will go with a wire, and put in the 'juice.' Then, after you have the bottom all tight, you attach an ordinary tire pump to the Schrader valve at the top and put in about 100 pounds pressure. The air can't leak out, first because of the Schrader valve; second, because of the valve cap, and, third, because of the heavy brass nut-cap that goes over the whole thing. And as the liquid is separated from the air by the floating piston, it is obvious that the gun can be used in any position, bottom side up or otherwise.

"Air pressure forces the liquid out in both the J-M Fyro and the Fire-Out, too, but in the Universal the liquid is forced out by gas that is imprisoned in a tiny capsule until the gun is used on a fire. When you turn the little wheel at the top, the capsule of gas is punctured, putting pressure on the liquid, and then when you turn the wheel at the bottom the liquid squirts forth and puts out the fire—if your aim is good. The principle is the same as the principle on which those home vichy siphons called 'Sparklets' used to work. If the fire is only a little one and only about half the liquid is used up, it is only necessary to put in a new capsule of gas to make the gun ready for the next fire."

Extinguishers That "Work On Gas."

"Speaking of gas," Sanderson butted in, "how about these big chemical tanks you see hanging around—in the elevated trains, for instance. Don't they work on gas, or how the dickens do they work, anyway?"

"Yes, they 'work on gas,' all right, as you express it. I'm getting to them; light your cigar. I've another I want to show you before we get to them.



Simplicity of Water Pail Pump Type.

"This one," he continued, showing the picture that is reproduced herewith, "is nothing more or less than a pail of water with a double-acting force pump in it, and it's a mighty handy thing to have around, even though it is not much good on gasolene. In the first place it holds no less than six gallons of water, and it will put out a good-sized fire where there is no gas around; in the second place, it is cheap to operate, for you can refill it any time from the faucet. It's better than just a pail of water, for you can shoot a stream 50 or 75 feet with it—up to the ceiling, for instance. It's made by the Liberty Mfg. Association, of Chicago, Ill.

"And now for the ones 'that work on gas,'" continued Rea, as he dug up catalogs labeled Liquid Carbonic Co., New York; James Boyd & Bro., Philadelphia, Pa.; O. J. Childs Co., Utica, N. Y.; and Badger Fire Extinguisher Co., Boston, Mass. "A whole lot of people make them—I've got only a few catalogs here—and they all operate on exactly the same principle. First, I'm going to tell you how they operate and why—it'll only take a few minutes—and then I'll show you wherein they differ.

"In the first place, the principal ingredient in all of them is water, and because it seemed funny to me that a water fire extinguisher should be recommended for gasolene fires I called up a good friend of mine in the Fire Underwriters' Laboratory and asked him about it. He gave me a lot of interesting dope and cleared up one or two mysteries that had been troubling me for some time. But before I go any further let me tell you what else is in these big chemical tanks. As I said before, the principal ingredient is water, and dissolved in the water there is a certain amount of soda—common baking soda, like 'Cow brand' that your mother probably puts in the water with peas and beans to soften the skins; druggists call it soda bi-carb. for short, the whole name being bicarbonate of soda.

"Suspended above the soda solution there is a little bottle containing two or three ounces, depending on the size of the extinguisher, of sulphuric acid, or oil of vitriol, whichever you choose to call it. On any of these fire extinguishers you have ever seen it says, 'To play, turn bottom up.' When you do turn them bottom up, the stopper drops out of the acid bottle and the acid promptly mixes with the soda solution and causes a tremendous quantity of carbon dioxide gas; this gas, by the way, is exactly the same as the gas that bubbles up in a glass of ice cream soda, or of vichy, or champagne; it's absolutely harmless.

INTERIOR AND EXTERIOR OF FIVE MORE PORTABLE AND EASILY OPERATED CHEMICAL EXTINGUISHERS

Squirting Liquid Out With Gas Pressure.

"The formation of gas, of course, creates considerable pressure inside the fire extinguisher, and it is this pressure that forces the liquid out. Of course, it is not water—that is, it's not all water—it is a gaseous liquid that issues in a sort of a spraying stream. It is the combination of carbonic acid gas and water that makes the extinguisher so effective. The water acts to quench the fire and the gas to choke it, and between the two of them they generally are effective."

"Yes, but I should think the acid would play hob with anything it touches," Sanderson half questioned.

Digitized by Google

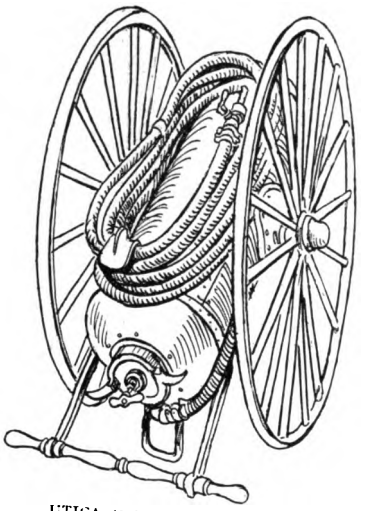
"So do a whole lot of other people," answered Rea, "but the assumption is quite foolish, for the soda solution is alkaline, and you have been taught in school that an alkali always neutralizes an acid. Don't you jump for the ammonia bottle when you spill acid out of your storage battery over your clothes? Well, the soda solution has the same effect on the acid that the ammonia has on it. It makes it harmless.

Advantages of Different Type Chemicals.

"Of course, each of these types of fire extinguisher—carbon tetrachloride and soda-acid—has advantages of its own under particular circumstances. Thus, for instance, a soda-acid extinguisher is particularly valuable where the fire has gained some headway and is pretty hot. In this case the great volume of water has a cooling and quenching effect that is very desirable. Then again, if the fire is hard to get at and cannot be reached by ordinary means, the carbon tetrachloride extinguisher is very good, for it will smother the fire, even if it is a pretty big one. Obviously, where the voltage is very high, it is well-nigh impossible to use a soda-acid extinguisher on an electrical fire, for the water is altogether too good a conductor of electricity and the user of the extinguisher is likely to get a pretty good jolt. The carbon tetrachloride gun is best in the case.

"There is another kind of an extinguisher that is somewhat like the soda-acid one. The Liquid Carbonic Co. make it, and it consists of nothing more complicated than a very strong cylinder of liquid carbonic acid gas. When the cock is turned the gas escapes and smothers the flames. That's all there is to it.

Extinguishers That Won't Fire Themselves.



"Of course, you can't always carry one of these soda-acid extinguishers on a car because the jolting would be likely to spill the acid into the soda and some one would be likely to be squirted unexpectedly. Consequently, some of the makers, and among them the O. J. Childs Co., supply extinguishers of this type in which the acid bottle is locked. This picture will make plain how it is done. The extinguisher can't 'go off' then until it is deliberately 'fired.'

"The picture shows only the top of the extinguisher. See the acid bottle cage (pointing to F with a greasy fore finger)? A is the lever handle to the stop cock and E is the lead stopper. The face of the stopper is ground to form a tight joint with the top of the lip of the bottle, which also is ground. The packing ring B around the stem of the stopcock prevents leakage if any of the liquid should get through the joint at C. D is a strainer over the outlet. To operate the extinguisher you first turn the lever A to the left, permitting the stopper to fall out of the bottle, when the whole thing is turned over.

"There is only one little drawback to these soda-acid extinguishers that I can see, and that is that they must be charged every time they are used, regardless of whether they are emptied or not. Also, they must be recharged at least once a year and they must be protected from frost, for they will freeze solid if left out in the cold. But the recharging chemicals are almost literally dirt cheap, and it is not a difficult job to fill them up after they have been used. It can be done in a few minutes. Several makers produce non-freezing soda-acid extinguishers, too.

Same Principle Involved in Big and Little.

"As I have said, all of these soda-acid extinguishers operate on exactly the same

UTICA 40-GALLON CHEMICAL

principle, even the great big ones that are used by the fire departments. Most of them you merely tilt over to start in action, and when you want to stop them you turn them back again. I'll tell you why this is. The outlet is at the top, and when you turn 'em over the solution is forced out. When you turn 'em back again, the solution runs away from the outlet but the gas escapes. In some of the larger ones a wheel at the top is provided, and when this is turned it crushes the acid bottle, or otherwise liberates the acid. Thereafter their action is the same as the action of the hand-type extinguishers.

"Dust boxes?" reiterated Rea, in response to a half question from the very much enlightened Sanderson. "Sure, I know what you mean, all right, only it is not considered quite proper to call them by that name. They are generally called dry power extinguishers, and nearly every maker of chemical apparatus makes these, too. Their action is somewhat akin to the action of the carbon tetrachloride extinguishers, which is to say, they put the fire out by smothering it. They are awfully handy—there's one hanging on a nail by the coat rack—and they are great when the fire is brand new and you don't want a watery mess around. All you have to do is to grab the thing down from the wall; the cap stays on the hook the device hangs from and you chuck the powder at the base of the fire. Pretty soon there is no fire. That's about all there is to it. Because the powder is dry it can't freeze, and as the cap is tight it can't get out and moisture can't get in; so the powder never cakes or gets hard, and the beauty of the thing is it is always ready and never has to be recharged. Most makers supply new ones for any that have been used."

"So, now that you know a whole lot more about fire extinguishers than you did before I started, what are you going to do about it. I'll bet you're going to forget it all the minute you are out of the door, and the next thing I hear you'll be hollering for sand again. But if——"

"Not on your life, I'm not, Billy! I don't want to see the bones sticking out of the carcass of my machine. I'm going right out and get one now—and say, could you loan me yours till I come back?"

Causes of Varnish Spots and Cures.

Notwithstanding the fact that some varnish will spot less quickly than others, the fact remains that all varnish will spot sooner or later, unless it is intelligently cared for. Spotting is caused by the extraction of the oil from the varnish, and as mud splashes literally suck out the oil if permitted to remain, it follows that they should be removed as quickly as possible if the appearance of the car is to preserved.

Danger Due to Forced-on Nuts.

Although it often is possible to force a nut on a thread which it does not fit and thus to make a temporary repair, the practice should not be encouraged, for it is likely to degenerate into a bad habit. Sooner or later it will be forgotten that the wrong size nut has been used, and if it drops from some important place the car and the passengers may be endangered.

Carburetter Connections That Clog.

While cold weather still is a little in the future, just now is a good time to take a look at the hot water or exhaust gas connections for the carburetter jacket. Sometimes they get clogged up and refuse to do their work when called upon without preliminary attention.

PRICE AND GEAR LOWERED IN TWO-CYLINDER AUTOCAR

Details Are Simplified, Construction Strengthened and Capacity Increased—Old Principles Retained Without Change.

The simplicity, compactness, good balance and other advantages of the horizontal opposed gasolene motor have appealed to many manufacturers of commercial vehicles; but few have made such good use of the principles involved as has the Autocar Co., of Ardmore, Pa., one of the few concerns adhering to this type of engine. The original design, brought out years ago, has been developed and improved year by year, but radical changes either in motor or in the balance of the truck have been few and far between.

In the latest production, model F, a number of detail improvements have been made to the substantial betterment of the car; the chassis price, however, has been reduced from $2,000 to $1,850. In regard to the motor itself, it is practically unchanged—unless the cutting of grooves in the pistons and the drilling of oil passages from the grooves to the interiors of the pistons can be called a change. This arrangement has the effect of removing surplus oil from the cylinder walls and carrying it back to the crankcase, not only reducing the liability to smoke, but also materially cutting down the oil consumption. The most important change in the car, perhaps, is in the rear axle, and consists in reducing the direct drive gear ratio from 6.1 to 1 to 7.1 to 1, and in changing somewhat the arrangement of the mounting.

LATEST AUTOCAR CHASSIS, SHOWING HINGED HOOD AND SEAT

As in the past the Autocar final drive is of the double reduction type—that is to say, the propeller shaft drives to a short jackshaft by bevels, and the jackshaft drives to the differential through a spur pinion meshing with a spur gear on the differential. In the older models it was necessary to remove the casing carrying the bevel gears, jackshaft and spur pinion in order to get at the differential. In the latest model a plate has been placed in the forward side of the axle casing, so that it is an easy matter to reach the differential, while the bevels are easily removed in their own casing, as in the older type. The axle throughout is of substantial construction, of the full-floating type, and has a high road clearance, which is advantageous for suburban work.

A change that results in quieter operation and the elimination of wearing parts is the mounting of the water pump on the forward extension of the engine shaft, where it is driven without gears; formerly the pump was driven by rawhide gears. Also, the rotor has a bearing both front and rear, instead of a bearing on one side only, which makes for greater durability. The capacity of the pump has been increased, and the cooling further improved by the employment of a fan directly back of the radiator and working in harmony with the fan formed by the bladed flywheel. The clutch operating mechanism has been concentrated on one side of the car—the right—instead of being on the left side and operated by a pedal on the right.

Though former Autocar models have had their radiators protected by a buffer formed by what is practically a continuation of the main frames, the model F has, in addition, a steel member which crosses directly in front of the radiator and carries an outside bearing for the starting crank, as well as giving that much additional protection to the cooler.

The spring clips, which formerly were ⅝ inch in diameter, have been increased to ¾ inch, and other details have been correspondingly strengthened. As a result of the general strengthening—which, however, has brought only a slight increase in the weight of the machine as a whole—the load capacity has been increased from 3,000 pounds to 4,000 pounds and the gear reduction enables the motor to handle the increased load with ease. The use of a governor acting on the throttle is continued. Consistent with the increased capacity of the truck, the tires have been made larger. Formerly the tires were 3½-inch front and 4-inch rear, all 34 inches in diameter. In model F they are 4 inches front and 5 inches rear. When pneumatic tires, which are optional, are fitted they are 5 inches in diameter, front and rear.

Other features of the Autocar which remain unchanged are the channel steel frame, with hickory reenforcement; tubular front axle; semi-elliptic front and platform rear springs; three-speed selective gearset mounted on roller bearings; multiple disk dry plate clutch. The tread is 58 inches and the wheelbase 97 inches.

Control is effected along conventional lines, the driver sitting on the right side of the car with gear-shifting and emergency brake levers at his right and the usual clutch, brake and throttle pedals conveniently located. The maximum road speed is 20 miles an hour, the limit being maintained by the automatic governor.

When Careless Washing Ruins Bearings.

Despite the fact that ball and roller bearings almost invariably are properly installed and are protected from the entrance of dirt and of water by thick felt washers, it still is possible for a careless workman to do irremedial damage to them by injudicious use of the washing hose. If the hose is aimed squarely at the bearing housing and the water permitted to impinge against it full force it is quite likely to work itself into the bearing and, in any case, the felt washer is likely to be wet enough for the moisture to reach either the balls or rollers, as the case may be, or the races. Consequently water should never be deliberately squirted against bearing housings; if the water is merely flowed over them it will loosen the dirt almost as quickly and there will be less danger of rusty bearings.

To Stop "Gas" Valves from Closing.

When gasolene line valves are not equipped with notches to keep them open when they are supposed to be open they are likely to jar closed and cause annoyance. The trouble can be eliminated by slipping an ordinary, but rather heavy, rubber band over the handle of the valve and the pipe in which it is inserted. It will then be a simple matter to stretch the band off when the valve is closed, and there will be no likelihood of its closing without manual aid. The band can be put in place by unscrewing the union at the valve.

1,055,332. Gas-Engine Starter. Stephen S. Krayer, St. Louis, Mo. Filed Feb. 19, 1912. Serial No. 678,517. (Ignition starter.) 12 claims.

1,055,346. Wind-Shield. Isaac G. McQuillan, Pittsburgh, Pa., assignor to Winterton Mfg. Co., Pittsburgh, Pa., a corporation of Pennsylvania. Filed Nov. 9, 1910. Serial No. 591,479. (Windshield hinge.) 3 claims.

1,055,349. Spark Igniting Device for Gas and Oil Engines. John Glen Newman, Moore Park, near Sydney, New South Wales, Australia. Filed Sept. 20, 1911. Serial No. 650,391. (Ignition system including pyrophoric igniting point.) 15 claims.

1,055,352. Carburetter. Charles J. Pembroke, Rochester, N. Y. Filed Aug. 9, 1911. Serial No. 643,243. (Carburetter with air intake controlled by perforated tapered sleeve.) 7 claims.

1,055,407. Radiator Construction. Virginius Julian Mayo, New Haven, Conn. Filed May 3, 1909. Serial No. 493,545. (Sheet metal radiator with interlocked joints.) 5 claims.

1,055,434. Radiator. Leon Williams, Toledo, Ohio. Filed April 13, 1912. Serial No. 690,583. (Sheet metal radiator with cooling fins.) 14 claims.

1,055,435. Controlling Means for Automobiles. Daniel P. Zapf, Canastota, N. Y. Filed April 12, 1910. Serial No. 554,939. (Control members carried on vertical columns.) 2 claims.

1,055,447. Resilient Wheel. Charley J. Craig, Lathrop, Mo. Filed Dec. 28, 1911. Serial No. 668,210. (Wheel with curved spring spokes.) 1 claim.

1,055,471. Brake Equalizer. Nils W. Kaunitz, Hoquiam, Wash. Filed March 25, 1912. Serial No. 686,052. (Rack-and-pinion equalizing mechanism.) 1 claim.

1,055,472. Tire. Martin L. Keagy, Canton, Ohio. Filed Aug. 2, 1911. Serial No. 641,907. (Cushion tire with three circumferential air cells.) 1 claim.

1,055,496. Vehicle Wheel Rim. Edwin Goupland Shaw, Akron, Ohio, assignor, by mesne assignments, to the United Rim Co., Akron, Ohio, a corporation of Ohio. Filed May 25, 1907. Serial No. 375,719. (Rim with contracting members for attachment.) 4 claims.

1,055,518. Antiskidding Device for Road Vehicles. Melville Clark, Chicago, Ill. Filed Dec. 4, 1911. Serial No. 663,703. (Disk device for preventing sideslip.) 3 claims.

1,055,542. Automobile Lamp. James Olandis Kendall and Thomas Orlean Robinson, Hanford, Cal. Filed Mar. 16, 1912. Serial No. 684,206. (License number cut out of front plate of lamp.) 1 claim.

1,055,550. Starting Mechanism for Explosive Engines. Herbert L. Meeder, Council Bluffs, Ia. Filed Mar. 11, 1912. Serial No. 682,908. (Fluid pressure started with two cylinders and rack-and-pinion action.) 3 claims.

1,055,553. Power Transmission System. Charles O. Pearson, New York, N. Y. Filed Sept. 12, 1908. Serial No. 452,756. (Hydraulic transmission system.) 30 claims.

1,055,554. Power Transmission System. Charles O. Pearson, New York, N. Y. Filed Oct. 8, 1908. Serial No. 456,699. (Hydraulic transmission system.) 17 claims.

1,055,557. Pneumatic Power Transmission Mechanism. Frank M. Prather, Los Angeles, Cal. Filed Nov. 7, 1911. Serial No. 659,066. (Pneumatic transmission enclosed in flywheel.) 4 claims.

1,055,558. Means for Lubricating Internal Combustion Engines. Louis Renault, Billancourt, France. Filed Apr. 9, 1910. Serial No. 554,549. (Pump circulation oiling system.) 3 claims.

1,055,569. Multiple Unit Power Transmission Mechanism. August Sundh, Yonkers, N. Y., assignor to Otis Elevator Company, Jersey City, N. J., a corporation of New Jersey. Filed Apr. 3, 1909. Serial No. 487,700. (Electrical transmission system.) 29 claims.

1,055,609. Motor Sleigh. John Chesney, Melita, Manitoba, Canada. Filed Feb. 5, 1912. Serial No. 676,626. (Motor sleigh with chain wheel drive.) 1 claim.

1,055,611. Convertible Engine and Compresso. John S. Clarke, East Cleveland, Ohio. Filed Nov. 20, 1911. Serial No. 661,306. (Radial cylinder motor convertible to an air compressor.) 4 claims.

1,055,619. Hydraulic Transmission Mechanism. William Dunn, Bannock, Mont. Filed Apr. 27, 1912. Serial No. 693,603. (Control system for hydraulic transmission.) 18 claims.

1,055,626. Clutch. Walter O. Foss, Branford, Conn., assignor to Charles E. Bunnell and Richard Bradley, Branford, Conn. Original application filed Mar. 2, 1911. Serial No. 611,932. Divided and this application filed May 20, 1911. Serial No. 628,513. (Clutch with separate engagements for different gears.) 1 claim.

1,055,635. Traction Engine. Henry J. Heider, Carroll, Ia., assignor to Heider Mfg. Co., Carroll, Ia. Filed Feb. 20, 1911. Serial No. 609,681. (Transmission system for tractors.) 5 claims.

1,055,677. Transmission Gearing. Jason C. Sparks, Concord, Neb. Filed July 6, 1912. Serial No. 708,076. (Friction transmission system.) 2 claims.

1,055,693. Explosion Engine. John Albert S. Anderson, Springfield, Mass. Filed Feb. 20, 1912. Serial No. 678,820. (Double-acting engine.) 4 claims.

1,055,709. Automobile Wheel. William W. Cheeseman, Cincinnati, O. Filed Feb. 29, 1912. Serial No. 680,620. (Disk wheel with spring cushions.) 12 claims.

1,055,708. Heater or Muffler Attachment. Harold S. Case, Standfordville, N. Y. Filed Apr. 4, 1912. Serial No. 688,540. (Exhaust heater.) 1 claim.

1,055,741. Speed Governor for Motor Vehicles. Edward A. Halbleib, Rochester, N. Y. Filed Aug. 4, 1911. Serial No. 642,316. (Ignition governed by exhaust pressure.) 17 claims.

1,055,742. Spring Wheel. Charles W. Ham, Memphis, Tenn. Filed Apr. 1, 1912. Serial No. 687,679. (Wheel with curved spring spokes.) 3 claims.

1,055,744. Strainer for Gasolene Tanks. Edmund E. Hans, Minneapolis, Minn. Filed Apr. 11, 1910. Serial No. 554,891. (Settling bowl and strainer below tank bottom.) 4 claims.

1,055,750. Resilient Wheel. Robert J. Hughes, Houston, Tex. Filed Dec. 31, 1907. Serial No. 408,716. (Wheel with cushions under sectional tire.) 2 claims.

1,055,765. Automobile Cultivator with Rotatively Driven Cultivating Disks. Marcel Landrin, Soissons, France. Filed Nov. 11, 1911. Serial No. 659,692. (Motor disk-plow with power-driven disks.) 9 claims.

1,055,769. Engine-Starting Mechanism. Carl E. Lipman, Beloit, Wis., assignor to The Lipman Manufacturing Co., Beloit, Wis., a corporation of Wisconsin. Filed Jan. 15, 1912. Serial No. 671,212. (Fluid pressure starter.) 8 claims.

1,055,774. Pneumatic Tire Casing. Nelson W. McLeod, St. Louis, Mo., assignor to American Tire Co., St. Louis, Mo., a corporation. Filed May 10, 1912. Serial No. 696,292. (Fabric threads held in tension by vulcanized rubber.) 1 claim.

1,055,813. Illuminated Number Plate for Motor Vehicles. Warren H. Seaser, Fresno, Cal., assignor of one-third to Frank L. Noble, Fresno, Cal. Filed Feb. 2, 1912. Serial No. 674,986. (Frame for front of lamp, carrying license number figures.) 1 claim.

1,055,834. Controlling Mechanism for Motor Vehicles. Milton Tibbetts, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed Feb. 5, 1909. Serial No. 476,485. (Throttle and accelerator control with interconnecting device.) 23 claims.

1,055,835. Resilient Wheel. Frederick F. Tighe, New York, N. Y. Filed Aug. 24, 1911. Serial No. 645,700. (Wheel with spring-cushioned plunger spokes.) 1 claim.

1,055,849. Roller Bearing. Oswald F. Zahn, Detroit, Mich. Filed une 26, 1911. Serial No. 635,431. (Spacer for roller bearings.) 1 claim.

1,055,895. Resilient Wheel. William John Faber, Oneida, N. Y., assignor of one-half to Christian C. Faber, Brooklyn, N. Y. Filed June 13, 1912. Serial No. 703,424. (Pneumatic cushion under rim.) 2 claims.

1,055,902. Gradometer. George O. Griffith, East Auburn, Cal. Filed Dec. 19, 1911. Serial No. 666,690. (Gradometer with gear movement and fan check.) 1 claim.

1,055,915. Acetylene Storage Tank. Joseph Hidy James, Pittsburgh, Pa., assignor to Searchlight Gas Co., Chicago, Ill., a corporation of Delaware. Filed Oct. 16, 1911. Serial No. 654,868. (Acetylene tank with corn pith filling.) 5 claims.

1,055,923. Lock for Motor Vehicle Steering Wheels. Louis E. Landes, Los Angeles, Cal. Filed Nov. 25, 1912. Serial No. 733,488. (Lock securing steering wheel to column.) 2 claims.

1,055,978. Engine Starter. Jacob Liebfried, Los Angeles, Cal., assignor of one-fourth to Edgar Lawrence Nicholson, Los Angeles, Cal. Filed July 1, 1912. Serial No. 707,572. (Distributing system for ignition starter.) 10 claims.

1,056,013. Tire Vulcanizer. Charles I. Dodson, Pittsburg, Kans. Filed Jan. 29, 1912. Serial No. 674,088. (Steam vulcanizer.) 8 claims.

1,056,098. Timing Device for Magnetos. Otto Heinrich Hugo Heins, Edgewater, N. J. Filed Feb. 19, 1908. Serial No. 416,569. (Variable timing device.) 2 claims.

1,056,107. Wheel. James A. Lowe, North Branch, N. J. Filed Sept. 2, 1911. Serial No. 647,391. (Spring Wheel with coiled springs acting through toggles.) 4 claims.

1,056,109. Vehicle Wheel. William B. McFadden, Syracuse, N. Y. Filed Sept. 15, 1910. Serial No. 582,206. (Pneumatic tire under rim.) 1 claim.

1,056,156. Demountable Rim. Albert Denis, Springfield, Mass. Filed Oct. 7, 1911. Serial No. 653,318. (Quick detachable rim with screw fastenings.) 1 claim.

1,056,167. Cushion Tired Wheel. Norman Gratz, Boise, Idaho. Filed Feb. 6, 1912. Serial No. 675,747. (Wheel with both spring and rubber cushions in tire.) 5 claims.

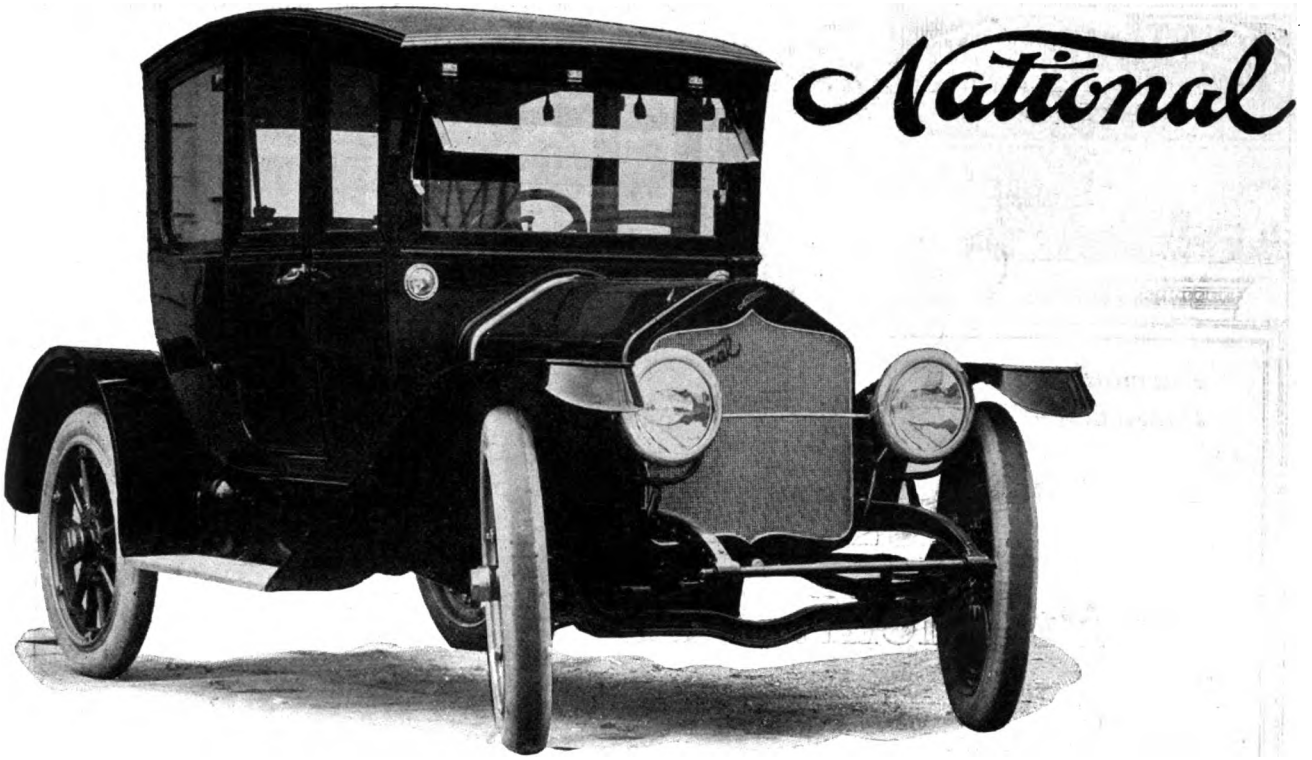
1,056,185. Spark Plug Demonstrator. George F. Kreitlein and Harry L. Roeger, Indianapolis, Ind. Filed May 31, 1912. Serial No. 700,572. (Display device for spark plugs.) 4 claims.

1,056,235. Device for Jacking Up Automobiles or Other Vehicles. Hosea S. Tuttle, Minneapolis, Minn. Filed Apr. 3, 1912. Serial No. 688,319. (Lever and toggle jacking device.) 4 claims.

1,056,253. Engine Mounting. Charles E. Brooks, St. Louis, Mo., assignor to Brooks-Latta Automobile Mfg. Co., a corporation of Missouri. Filed May 29, 1911. Serial No. 630,212. (Hinge joint in ends of supporting arms of crankcase.) 3 claims.

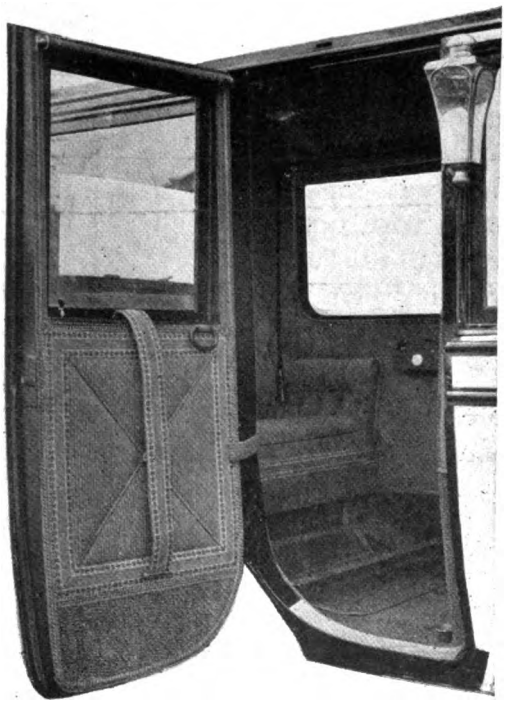
1,056,265. Horn for Motor Cars and Other Vehicles. Amedee Couesnon, Paris, France. Filed Feb. 7, 1912. Serial No. 675,994. (Horn operated by power-driven air pump.) 2 claims.

1,056,278. Vehicle Wheel. Thomas B. Jeffery, Kenosha, Wis.; Kate E. Jeffery, Charles T. Jeffery, and Harold W. Jeffery, executors of said Thomas B. Jeffery, deceased. Filed Oct. 13, 1906. Serial No. 338,713. (Wheel with split rim and spokes with attached heads adapted to be clamped to lugs on rim.) 5 claims.



1,056,292. Power Transmission Mechanism. David Nettenstrom, Chicago, Ill., assignor of one-half to Charles H. Elder, Chicago, Ill. Filed Apr. 3, 1911. Serial No. 618,678. (Combination of friction and gear drive.) 3 claims.

1,056,294. Vehicle Wheel and Tire Member Therefor. Frank W. Ofeldt, Hoboken, N. J. Filed Dec. 26, 1911. Serial No. 667,930. (Cross bars of stranded cable on tire.) 7 claims.



1,056,418. Engine Starter. Percy W. Hodgkinson, Rochester, N. Y., assignor of one-half to Jacob C. Lombard, Rochester, N. Y. Filed Apr. 8, 1912. Serial No. 689,431. (Fluid pressure starter.) 4 claims.

1,056,510. Gas Engine. Edward Pyle Dawson, Butte, Mont. Filed May 9, 1907. Serial No. 372,810. (Regenerator for recovering heat of exhaust gases.) 9 claims.

Now Is The Time To Order Your Closed Car For Fall And Winter

OUR wide range of exclusive styles gives you an individual closed car—made to order, as it were.

TRUE artists have produced rare beauty and convenience, accompanied by luxurious comfort for our discriminating patrons.

TO the National car's heritage of flexible power, noiseless operation, and reliable performance is added an opulence of refinement and a wealth of beauty. The control of our closed cars is simplicity itself.

EVERY one of our closed cars is so perfectly complete in every detail that to attempt to mention them separately detracts from their harmonious effect produced for your warm, restful motoring.

IT costs you no more to ride in the National's atmosphere of supreme comfort and enjoyment—don't delay. Order now and be sure that your Coupe or Limousine will be ready for you by the first cold wave. Let us send you complete information. Simply address National Motor Vehicle Company, Dept. 90, Indianapolis, Ind.

Harmonized Construction

Endorsed on Two Continents

Problem: Fours or Sixes?

¶ Which will YOU sell—fours or sixes? Has it puzzled you to know how to solve this problem? Do your customers look at their money a long time before they buy? Do they want a good looking car, yet durable and economical? Do they want to rush the hills? Pass everything on the road? Quick getaway? Dash and class regardless of cost?

¶ You must please your customer or you don't get the order. Your customer can choose. You *must* choose! So why not reduce your overhead and the chance of losing sales by selling both?

¶ Pathfinder Fours and Sixes settle your problem. The Four is economical of gasoline and capable of long and useful service, as proved by its five transcontinental journeys. The Six will carry any lover of power off his feet. Its sensational streamline body and speedy, powerful appearance will make it the *"Master of the Road."* Write us the situation with you. Have you settled your problem? Get a full description of the Pathfinder cars, with an instructive outline of the "selling plan." Write your name on the margin.

A Continued Story
Chapter 6

The End

WOW!
It's a Mighty Good Joke

I found another old geezer who thought as I did about hand cranking, and unloaded on him.

Oh yes, my new car has the Electric Cranker, and gee, what beautiful lights.

Lord! It's a pleasure to sit in the seat and let machinery do the work—and I can wear good clothes and look like a human being now, too.

Don't have to remember a blasted thing about Starting either, except to push the button. What a think-tank that dinky little cranking machine must have, but it's my private opinion that the real heart of the whole contrivance is that little LBA Battery back there on the running board.

LBA
Storage Battery

Unexcelled American Skill
Unexcelled American Manufacturing Processes

have produced the Unexcelled, American-made, New Departure ball bearing — the bearing that has proved its superiority by actual service in 80 per cent. of American-made motor cars.

Three Types:

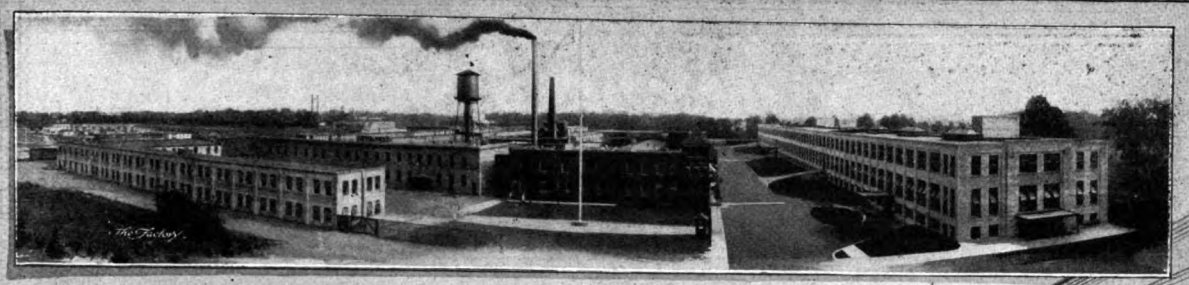
Double Row — A two-purpose bearing of maximum capacity for both radial and thrust loads.

Single Row — For radial loads only. An improved separator is an advantageous feature.

Radax — High grade cup-and-cone type bearing for sustaining radial loads and one-direction thrusts.

Descriptive catalog will be sent on request.

Engineering consultation service at your command. Send us your blueprints, speed and load data and we will tell you what size and type of bearing will best do your work with greatest efficiency and least friction and wear.



"Elimination of Friction" brochure, now in third edition, discusses the relative merits of balls and rollers in bearing work. A copy will be sent you free on request.

The New Departure Mfg. Co.
Bristol, Conn.
WESTERN BRANCH: 1016-17 Ford Bldg, Detroit, Mich.

"New Departure Ball Bearing Manual" full of information for the garage man and dealer, just off the press. The only book of its kind. Ask us for it.

Special data sheets on New Departure Self Aligning Shaft Hangings and use of New Departure Ball Bearings in machine tools sent free on request. Address New Departure Mfg. Co., Hartford Division, Hartford, Conn. for them.

OLDS MOTOR WORKS

Lansing, Michigan.

Four- or Five-Passenger Phaeton, Touring Body Type, $2975. Seven-Passenger Touring Body, $175 Extra. Limousine, $4300

$2975 For a Six Cylinder OLDSMOBILE $2975

Lower in price, and even higher in quality than any of its predecessors—the Model 54—1914 Oldsmobile is creating more concrete evidence of live dealers interest than any other high grade six on the market.

The Price

$2975 practically eliminates competition with dealers handling cars priced from $4000 to $5000—for the Oldsmobile is as good as any of these. The lines of this car are of distinctive Oldsmobile design—a standard which has led all competition, whatever the price.

We Are Six Cylinder Pioneers

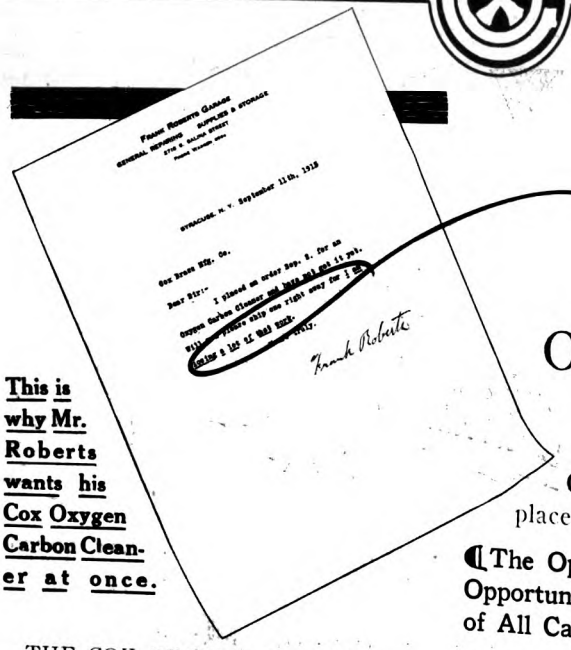
Oldsmobile pioneered the six cylinder motor, and it is unnecessary to dwell on the value of the years of ripe experience in the manufacture of six cylinder cars—which is back of Model 54. The Oldsmobile unit power plant 3 point suspensions (bore 4¼, stroke 5¼) is a wonderful piece of machinery. In performance and appearance it meets every and all requirements, and astonishes the experienced motorist with its marvelous flexibility and power. Words cannot adequately portray its many good qualifications.

Matters of Comfort, Utility and Refinement

We learned how to build comfort into the Oldsmobile in the early days of the industry. If we knew of any better equipment or little matters of refinement than are on the Model 54 we would be the first to install them: But we have put everything into this car that spells utility, comfort and refinement.

Prompt Deliveries

Never in the history of this Company have we been so well prepared to take care of our dealers by prompt shipment of cars as ordered. We began the delivery of our new models August first, and each day sees the regular quota of cars coming through the factory, tested and inspected down to the minutest detail, on schedule time. You can absolutely count on all delivery promises being adhered to rigorously.



Write Us at Once

In a short while, orders for all cars available for the coming season will be closed, and we shall be unable to go beyond this point. We urge, therefore, that if you wish to sell a car that measures up to the highest standards of quality, workmanship and design, you write us at once, letting us know your prospects, size of territory desired, and your facilities for properly representing the Oldsmobile line.

COX OXYGEN CARBON CLEANER

This is why Mr. Roberts wants his Cox Oxygen Carbon Cleaner at once.

How Much Are YOU Losing?

OPPORTUNITY knocks once at every man's door.

¶ The opportunity offered by your using a **Cox Oxygen Carbon Cleaner** will continue to apply for its place in your garage or repair shop, but

¶ **The Opportunity for the Best Profits, the Opportunity to Get the Bulk and the Cream of All Carbon Cleaning Work in Your City;**

¶ **The Opportunity of Making More Than the Investment in a Day;**

¶ **The Opportunity of Making $2 Earn from $30 to $35 is Sure and Safe** to the man who is shrewd enough to grasp it first and get the start on others.

THE COX OXYGEN CLEANER is a device that makes possible the only perfect cleaning out of carbon from the cylinders of a gas engine. No method other than burning it out with oxygen even compares with the results of this latest accepted method.

IT COSTS but $25 and is guaranteed absolutely not to harm any motor.

OXYGEN costs $3 per tank full—you do not buy the tanks, they are loaned to you and you are charged for refills at the rate of $2 per tank.

EACH TANK contains enough oxygen to clean from 35 to 40 cylinders and any $15 per week man or boy easily cleans a cylinder in from 6 to 10 minutes through any of the cylinder openings.

$1 PER CYLINDER is the universal charge for this work, consequently every $2 spent for oxygen nets you from $30 to $35.

¶ The man who gets this business coming is bound to hold the bulk of it by reason of doing better work and by not holding up customers' cars.

¶ We cannot urge too much the advantage of being the first in your town or city to take advantage of this opportunity. $2 spent makes $30.

¶ Write or wire for more particulars.

A New Era—A New Opportunity

Dealers: Are You Alive to the Latest Developments of the Electric Car Business?

Are you one of the dealers who have said, "Some day I'll take on an electric car. But not now; I'm not ready for it?"

Or do you, perhaps, belong to those who have thought, "It's not worth while handling electrics; I can't sell enough of them?"

THE Detroit ELECTRIC

To both classes we reply, "Now is the time to take on an electric. For a new era has just dawned in the electric car business—an era of large production, of lower prices, of wider use for electric cars, of increased business for dealers."

Among the makers of electric cars we are the first to reach a point long since attained by some gasoline car builders—a point where our production is large enough to permit the marketing of a car of superlative quality at a medium price.

How We Bring Prices Down

Electric car prices in the past have been too high. Dealers have said it; manufacturers have known it. But no manufacturer was producing a big enough output to bring down the price.

At last we have done this. Where the average electric car builder is turning out 500 cars per year, we shall this season build from 1,800 to 2,000. Our volume—already more than twice that of any other electric car builder—has enabled us to adopt advanced manufacturing methods and to install high grade equipment impossible to the maker with smaller output.

Thus we are able to offer, for the 1914 season, a selling proposition absolutely unequalled in the motor car industry today.

Opportunity's Second Call

Do you recall the early days of the gasoline car business? Perhaps at that time you had an opportunity to take on one of the cars of medium price and large production—a car that since has earned thousands of dollars for the prudent dealer who took the agency. Have you ever been sorry you were not handling that car? Have you ever regretted that you did not take it on when you had the chance?

Today you stand in a similar position with reference to the electric car business. The electric is just coming into its own. Modern improvements, in which the Detroit Electric has always led, have made it a car for town and country, for men and women, for business as well as pleasure.

Dependable, safe, clean, economical to operate, it is daily appealing to a wider and wider circle of buyers. And now, with the substantial price reductions offered by the Detroit Electric, the market is greatly extended, the sales opportunities tremendously enlarged.

A Wonderful Line

Our 1914 cars, though moderate-priced, offer a combination of desirable features never before presented in an electric car—at any price. Our line is exceptionally comprehensive. Two chassis models are offered—a worm gear type and a bevel gear type. Seven different body styles are furnished. Choice is offered of front seat drive, rear seat drive, or Detroit Duplex drive, operating from either seat.

The striking features of our 1914 models include Detroit Electric clear vision bodies, Hanlon patented double glass rain vision window, full aluminum body panels and roof, full skirted aluminum oval crowned fenders, electric hand brake, Detroit Electric Shaft Drive (chainless), extra large tires, increased battery capacity, superfine upholstery, Warner speedometer, high grade clock, and many minor details in construction and equipment.

Now Is the Time to Act

Here is a real opportunity to repeat the success of the gasoline car industry. Here is a chance to get into a branch of the motor car business which presents the greatest possibilities of growth and profit.

If you are a gasoline car dealer and want to add to your sales and profits, write us now and find out if your territory is still open. If you are already an electric car dealer and want to increase your business, to make sales faster and easier, get in touch with us.

And remember—that in taking on the Detroit Electric agency you are tying up with the largest makers of electric pleasure vehicles in the world, with a solid, substantial company, amply financed and soundly managed.

Literature and dealer's proposition on request.

Gilmer Rebound Strap

Rebound straps cost less than broken springs

Gilmer Rebound Straps

stop a car's rebound before it starts. They stop all accidents and all damage resulting from broken springs before such a contingency can happen.

The downward thrust of a car's body does not hurt the springs—they are built to take care of just such work. A spring which will give comfortable riding qualities to a car cannot be stiff enough to take care of a car's rebound caused by riding over a bump or a stretch of rough going. It is the rebound which breaks the springs and it is the rebound that Gilmer Rebound Straps prevent before it starts.

Regardless of the kind of shock absorber a car may be equipped with, it needs a set of Gilmer Rebound Straps to preserve the springs.

Every motorist in your territory is a prospective customer for a set of Gilmer Straps. Several manufacturers—among them Packard, Cadillac, Premier, Hudson, Hupmobile, Chevrolet, Cartercar—make Gilmer Rebound Straps part of their chassis equipment.

Each strap is guaranteed for a year. They are made of the best grade of Long Fibre Cotton yarn, water-proofed and weather-proofed, and each strap is tested to resist a strain of 5,000 pounds.

Send for our dealers' proposition. You can insure your customers against a nasty and expensive repair and at the same time earn a nice profit.

L. H. Gilmer Company, **52 N. Seventh Street Philadelphia, Pa.**

Don't Ask a Car Owner to Pump Tires by Hand!

Pumping tires by hand is the cause of more than half the "tire troubles." The physical energy required, the loss of time, and often the loss of temper are big factors. Make the engine fill the tires by installing a

Four Cylinder KELLOGG Tire Pump

Adopted as standard equipment on the better cars and highly recommended as special equipment on many others. Manufacturers and dealers should investigate this tire pump even before electric lighting systems, automatic gear shifts, etc.

Car owners want the KELLOGG PUMP because they need it. Price is moderate, and attachments are ready for practically every important model now in use.

Send for our book, "Air on Tap."

The Makers of These High Grade Cars Use and Endorse The Standard Kellogg Tire Pump:

Austin Automobile Co.
Chalmers Motor Co.
Dayton Motor Co.
Edwards-Knight Motor Car Co.
Haynes Motor Car Co.
McFarlan Motor Car Co.
Oakland Motor Car Co.
Packard Motor Car Co.
Palmer-Singer Mfg. Co.
Peerless Motor Car Co.
Staver Carriage Co.

The Ellis Gasolene Purifier

THE Ellis Gasolene Purifier consists of a series of screens and filters which intercept every particle of dirt, grit and sediment common in commercial gasolene, any of which cause trouble the minute they get into a carburetor.

Water, too, is always present in gasolene and no amount of screening, filtering or chamoising can keep it from getting into the carburetor and causing trouble.

The Ellis Gasolene Purifier traps every drop of water by gravity and retains it in a precipitation chamber, from which it can be drained at any time.

Remember this—a carburetor will work right if given a chance, provided it does not have to vaporize anything except pure gasolene.

Study the diagram of the Ellis—the most minute particle of sediment cannot get by its filters. Water, which is heavier than gasolene, sinks to the bottom of the trap provided to catch it.

Fine as they are, the screens and filters of the Ellis do not retard the flow of fuel to the carburetor—they simply and effectively stop anything besides pure gasolene getting into the carburetor. ***The Ellis Gasolene Purifier insures against carburetor trouble by taking out of the fuel all causes of carburetor trouble.*** By striking at the cause it remedies the evil.

Send for an Ellis for your demonstrator. The results you will get will convince you how you can relieve the cars you sell of all carburetor trouble. It costs $3.50 and can be put on inside half an hour. The Ellis requires no other attention than draining once a week or so. When ordering, state diameter of fuel feed pipe.

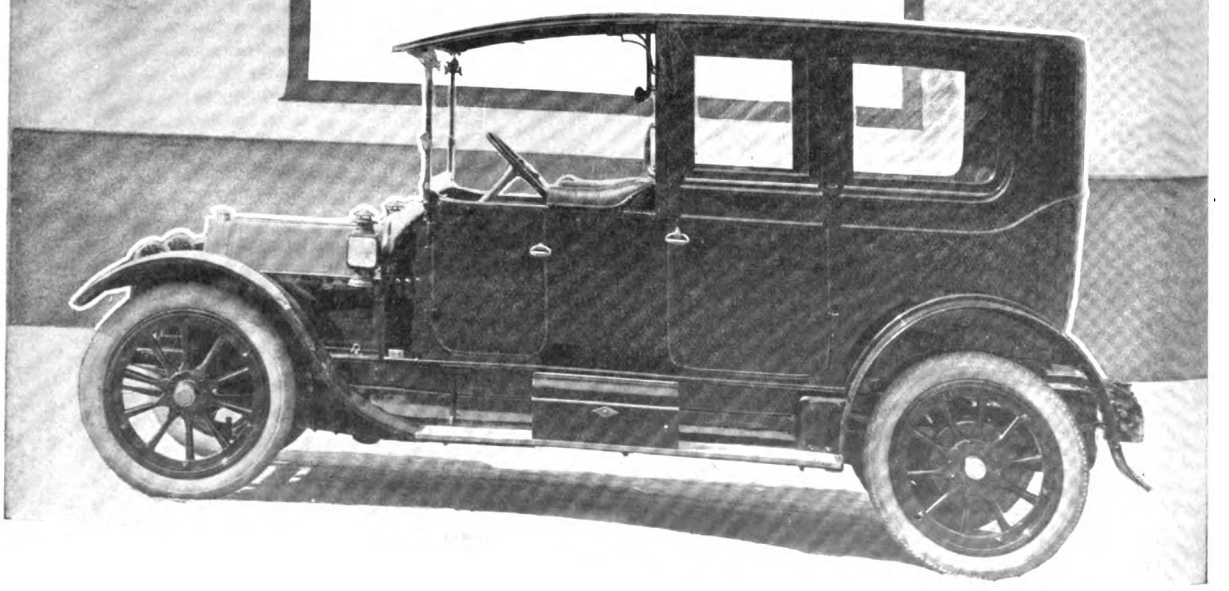
Lancia

AMERICA'S FAVORITE FOREIGN CAR SOLD AT AMERICAN PRICES

Lancia cars, made in Europe, offer the American buyer every European point of superiority in material, engineering features, workmanship, design and finish—and it is conceded that car building methods which obtain on "the other side" are years in advance of American methods.

And American Dealers can sell Lancia cars at American prices.

You, Mr. Dealer, know that limited quantity production insures the ***personal attention*** of every man engaged in the building. Lancia production is typically European because it ***is*** limited. Here are no American cut and dried operations that produce quantity at the heavy expense of quality.



Lancia dealers use these arguments as the basis for selling arguments.

Car wise buyers who want European automobiles are quick to grasp and act upon them.

There is some choice territory awaiting dealers who are looking for that ***different and better car.*** Are you such a dealer?

Something more about—

INVAD

INVADER OIL **will** leave a carbon deposit. So will every other oil.

INVADER OIL **will** smoke when it burns. So will every other oil.

When INVADER OIL is used it **may be** necessary to grind valves. Such certainly would be the case with every other oil.

A motor using INVADER OIL **can** overheat. So it can when any other oil is used.

A machine exclusively lubricated with INVADER OIL **will** eventually wear out. This would also be the case no matter what oil was used.

ER OIL

INVADER OIL is **not** a perfect lubricant, neither is any other oil. There is no such thing.

INVADER OIL, however, is chemically superior to all other oils. It will deposit **less** carbon, make **less** smoke, mean **less** grinding of valves, make a motor **less liable** to overheat, and will cause the machine using it to last **longer** mechanically than would be the case were **any** other oil used.

Remember that the superiority which is indicated by its better tests is a superiority which cannot be contradicted. INVADER OIL is better because its tests are better. There is no way of avoiding this fact.

A Motor That Can't Be Stalled

Here's a New Factor in Safety— An Additional Source of Comfort

Any motor ***might*** lose its spark unexpectedly; the gas ***might*** be cut off accidentally. Think of the possibilities if this should occur on a crossing.

The non-stallable motor of the New Chalmers "Six" protects you in such a case. The electric starter speeds up the motor even should the gas be cut off or the spark interrupted. It keeps it running in every emergency.

It prevents "going dead" in crowded traffic; keeps it from stalling under sudden overload.

A Guardsman Always on Duty

The starter is always ready. It comes into action automatically with the release of the clutch whenever the engine speed drops to a certain point. No need to give it a thought. Throw on the switch at the outset —that's all.

This non-stallable feature of the New "Six" gives you a sensation of security that doubles your motoring pleasure.

Where the New "Six" is Supreme

No honest maker claims that a "Six" will get away any quicker—run any faster or climb any steeper hills, than a "Four" of equal weight and horsepower.

But Oh! how much more smoothly, silently and easily it does it. The six cylinders give a continuous stream of power; there's no interval between explosions; the impulses are utterly imperceptible.

The entire absence of vibration nearly doubles the life of the car and the comfort of the passengers. You can tour day after day in the New "Six" with the comfort of your easy chair.

Ride in it once and you'll be forever spoiled for any "Four."

Here's Flexibility No "Four" Can Equal

Take the wheel of the New Chalmers "Six." Push the switch of the electric starter and let in the clutch.

Notice how quietly—how smoothly it moves away. See how easily and how quickly it mounts to 20—30—40 miles an hour or throttles down to two—and then off again, without shifting gears.

That's flexibility. And it's all in the motor itself; gear shifting is seldom needed. Any auxiliary gear mechanism to secure flexibility would be merely superfluous weight.

Let the Car Prove It

Come and see this wonderful "Six." Its classic beauty—its harmony of outline will fascinate you.

Let us take you for a ride in it. Its mystic silence —its velvety smoothness—its supple power will give you a new sensation in motoring pleasure—the thrill of speed with the luxury of rest.

Proving up the Differential Carrier of a Timken-Detroit Rear Axle by means of the Carrier Test Gauge. At the right is given the reason for this important check on the accuracy of many operations

The Teeth that Always Fit

Part IV Sequel to The Gear with the Polished Teeth

TIMKEN-DETROIT · AXLES ·

THE driving-gears are finished—ground to the perfect accuracy that is obtainable only by the exclusive method of Timken Gear-grinding.

The differential carrier is finished, too, It is ready to receive the polished gears and to be bolted to the axle-housing.

But one thing remains—we must *know* that the work has been done right: and so we come to the last chapter in the story of "The Teeth That Always Fit."

A Gauge That Proves Many Things

The carrier is turned up on its smaller end and slipped over an upright shaft that forms part of the test gauge. On this shaft are two circular discs that fit into the holes reamed out for the pinion aud pinion-shaft bearings. This fixes the perpendicular axis—the position of the pinion-shaft.

Now discs are fitted into the openings for the differential bearings, and through them is slipped, horizontally, another shaft—which you see plainly in the picture. If the holes for the differential bearings are not perfectly in line with each other the shaft can not pass through both.

But it must also be in a plane at right angles to the upright passing through the pinion bearings. So the operator takes the gauge, which you see in his right hand, and slips it through a hole in the horizontal shaft and down into another hole in the upright shaft.

It goes in; the axis of the drive shafts is in the right plane!

But is it in the right position in that plane? The gauge will tell us. It has an arm that comes down over the shaft—you can see it. He pulls it up, and turns it around so that the arm comes down on the other side of the shaft—next his body. A very slight variation of either of the differential bearing cups from its true position can thus be instantly detected, as the arm will be loose on one side, too tight on the other.

Lastly, the distance is measured from the center of the horizontal shaft, at each end, to the rear face of the carrier (in which you see holes bored for the bolts that fasten it to the axle housing.)

The test is complete. *If the carrier fails to pass, it is rejected without mercy.*

FOR on the correct relation of those "four holes", and that rear face, depend the perfect meshing and quiet running of "the teeth that always fit" as long as they are in the car.

To throughly appreciate the importance of this test in long wear, full transmission of power, quietness, and saving of gasoline, you should read the preceeding chapters in this story. The complete series will be sent you free, postpaid, at your request.

Regal

Sell Regal Cars This Year!

Every Demanded Feature-Popular Prices

Model "T"—5 Passenger Underslung Touring Car—$1125

The New Series of Regal cars offers the very latest features ---just what automobile buyers insist upon---at prices within reach of thousands. These two facts give these new cars an unprecedented selling power.

EVERY present Regal dealer believes this will be the **greatest profit-year** in his business history. We are certain of it. We want to convince you. **The first reason is:**

Regal Cars

The New Series consists of four models—three of them built on the proven and famous Regal Underslung construction. This method of building—the frame below the axles—gives long, low body lines, insures against "turning turtle" or skidding and saves tires and gasoline. The other model is a big, beautiful, luxurious overhung car. **The second reason is:**

Regal Advancements

We have incorporated the following demanded features as standard equipment on all Regal cars:

Electric starter and lighter. Electric headlights, with dimming attachment. Left-hand drive and center control. Long sweeping body lines enhanced by graceful cowl dash. Switch for starter, lighting switches and speedometer on instrument board. Special attachable curtains. Rain vision and ventilating windshield. Demountable rims. Tire irons, etc. **Add to this a third reason:**

Regal Prices

A dealer **must** sell a **low-priced car** if he expects to make money. Around **$1000** is the **big market** this year. But you **can't** afford to handle a poorly built car no matter what the price is. We **offer you** the very lowest, consistent prices and cars that can't be built better—that have always **stood up** and always satisfied their owners. **And now the last reason is:**

Regal Organization

Our tremendous growth during the past seven years has been due to the merits and prices of our cars, combined with a careful, sound business policy. We are **permanent** and **financially prosperous.** Our vast factory facilities insure speedy deliveries and efficient factory service.

These are some of the big arguments why you should handle Regal cars this year and get **your share** of the money Regal dealers will make. Now read carefully our specifications.

Specifications---Model "T"

Concentration of *Thought* Upon Rim Construction *Only* Has Proven Its Worth

The concerns in this country manufacturing steel rims used on motor vehicles do not exceed twelve in number, and out of this number the Jackson Rim Co. of Jackson, Michigan, is the ONLY one whose product consists of rims EXCLUSIVELY—Consequently we claim a superiority over other producers, because we devote our entire time to "RIM THOUGHT." The men connected with us are trained mechanics—RIM trained—and have spent their time in developing and perfecting machinery that is individually ours. Special treatment of the steel in our rims has brought them to the highest possible standard, to meet the strain and requirements to which rims are subjected. Our new plant is of concrete, steel reinforced and is absolutely fireproof, and this protection should in itself appeal strongly to every manufacturer of Automobiles. Our capacity of 2,000 sets of rims per day is a safeguard in placing your specifications with us.

JACKSON RIM CO., Jackson, Mich.

Digitized by Google

We Make *Pneumatic* Tires Only And Therefore Make Them Well

THE SPECIALIST is a leader because he can produce in his particular line *better* than the man of general attainments. We are Specialists in the Manufacture of Pneumatic Tires. For fourteen years, since beginning business, we have made nothing else.

The outcome is what anyone would expect—SUPERIORITY—fairly reflecting such concentrated effort—an exclusive construction, known as Fisk Heavy Car Type, in which are embodied the lessons we have learned.

The *Quality* of our product is backed by integrity that has never been questioned, and an organization which, from the President down to each of the Branch Managers and assistants, is dominated by a spirit which places "the satisfaction of customers," whether dealers or consumers, above all other considerations.

We make Heavy Car Type Fisk Tires in all styles to fit all rims—Plain Tread or the famous Town Car (non-skid) Tread. Write Dept. 23 for Fisk Dealer Proposition.

THE tendency toward all-metal construction has become an irresistible movement in all lines of building. Steel is used for the framework of buildings, bridges, etc. It provides protection against fire and elements and makes open, web-like construction possible, at the same time supplying the means of securing flexibility required by any structural work which carries a tremendous load.

In almost every means of transportation, railway coaches, steamships, automobiles, etc., where high speed is required steel construction demonstrates its superiority over wood. While the more compact construction made possible by the use of steel is desirable, its greatest benefit is the factor of safety that accrues.

From an engineer's standpoint the nature and properties of steel open up opportunities for wonderfully practical development in many fields. Think what Brooklyn Bridge would look like if built of wood and you have some conception of how the appearance of an automobile is refined and improved by the adoption of wire wheels. A structure such as the Brooklyn Bridge, which is as safe and efficient now after years and years of constant service, exposed to all kinds of elements, would not carry its own weight were it even possible to build it out of wood. This may give you an idea of the relative strength of steel and wood, and it may also serve to give you an idea of the relative safety of the two kinds of construction.

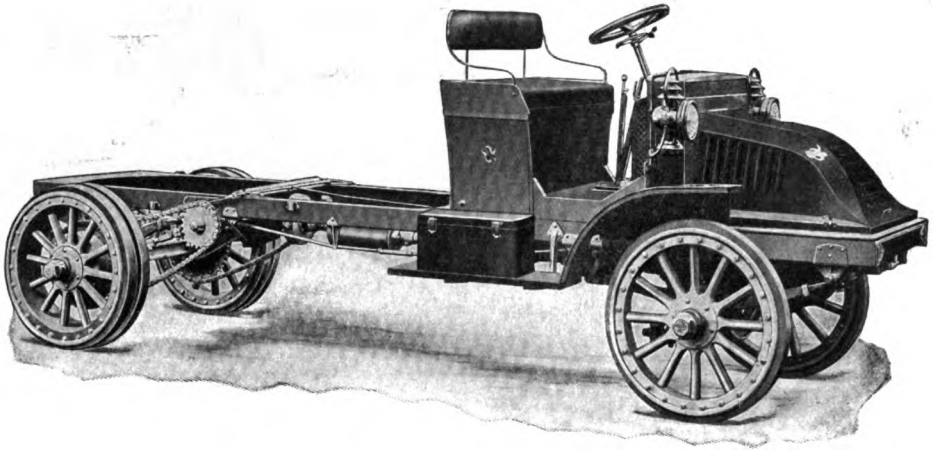
THE Mc CUE
Buffalo

Digitized by Google

CONSTRUCTION

WIRE wheels are the last and most important wood replacement in automobile development, the last step in making the motor car what it should be, a creatue of steel throughout.

McCue Wire Wheels are built along the most modern conception of wire wheel construction. Standard Ⓢ spokes, made by the Standard Co. of Torrington, Conn., are used. With McCue Wire Wheels the weight of the car is suspended equally from all points on the rim and the rim itself, impervious to weather, is light, thus relieving the tire of the extra pound, pound, pound which the heavy wooden rim subjects it to. Steel rims also conduct the molecular and frictional heat away from tires and prolong their life more than fifty per cent.



To sum up, steel wire wheels are more economical, resilient, more refined and, best of all, provide a factor of safety in proportion to their strength—seven times that of wooden wheels in their capacity to support loads, and fifteen times the strength of wooden wheels to resist side thrust such as comes from skidding, etc.

The McCue Company is prepared to make delivery according to specification and the quality and performance guaranteed by McCue wheels is so settled that manufacturers now have no further reason to refuse wire wheel equipment whenever ordered. Write us for booklet describing the development of wire wheels, causes which brought about their use, and their superiority when compared with the ordinary artillery type wheel..

A Time-Tested Truck With a New Name

HORNER

Motor Trucks

One to Five Ton Capacities

Eight months ago we purchased the patents, rights, designs, patterns, etc., of the Grabowsky Power Wagon Company of Detroit, and began the manufacture of the Horner Motor Truck.

Essentially the Horner is identical with the Grabowsky; and the latter's success in the past is the evidence of its worth and the worth of the Horner.

Improvements and refinements have been made where they were necessary or beneficial; and the manufacturing established on a sound basis.

Our organization is composed of men whose experience covers the life of the motor truck industry—men who literally have grown up with it.

The Horner Truck, therefore, is not an experiment or an untried machine without a record.

Its manufacturers are not theorists or experimenters.

The organization is well equipped financially.

We have the nucleus of a sales and service organization in the field.

We are now building up a complete sales and service organization.

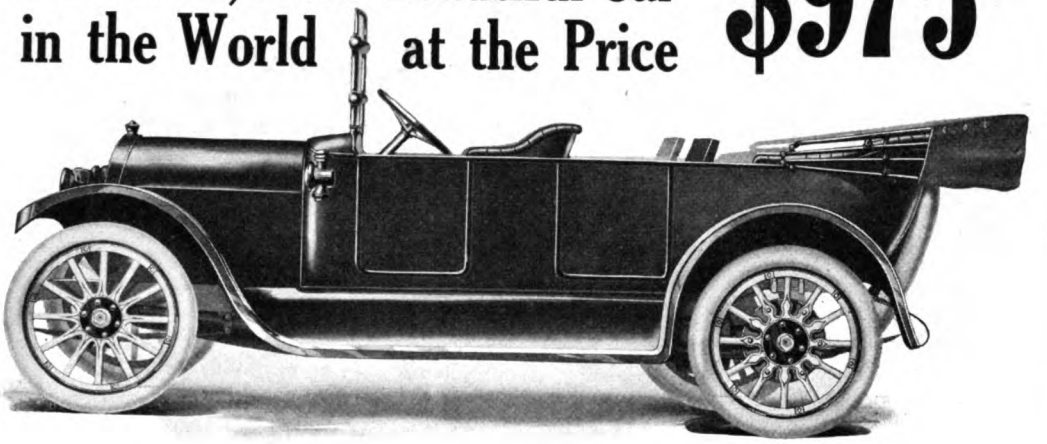
We want representation in the most advantageous centers—the very best, most energetic, most businesslike, most conscientious representation to be had.

Less will not be considered.

We have a truck that is new in name only; a truck with a long record of success back of it; with the right kind of manufacturing organization at the factory.

We want men who appreciate these things, and who are willing to make the most of them in their own territories.

On that basis we shall be glad to hear from you and discuss the possibility of a connection.



If the proposition appeals to you, please write us.

Detroit-Wyandotte Motor Co., 300 Fifth St., Wyandotte, Mich.

$975 $975

The Biggest, Most Powerful, Most Beautiful Car in the World at the Price $975

The PARTIN-PALMER "38"

Six Passenger, 115 Inch Wheelbase, Left Hand Drive

The Partin-Palmer car is expressly designed and built to overcome all competition, and to give the purchaser the very finest car in the world at anything like the price. Compare it point by point with any car selling under $1200 and see the many advantages the Partin-Palmer offers. You will see at once that this is THE CAR WITH NO COMPETITION and at the popular price.

MR. DEALER, you realize that means THE RAREST OPPORTUNITY IN THE AUTOMOBILE WORLD TODAY!

Backed by a Powerful Organization

We invite every automobile dealer and prospective purchaser to investigate in detail the exceptional strength of the organization back of this splendid car. The men who comprise the organization are men of wide experience and reputation in the automobile world, and their well known manufacturing and executive ability are your assurance of the success of this car. The manufacturing facilities are ample to supply the demand PROMPTLY; and the great financial strength of the organization insures you that this car is here to stay.

Compare These Specifications With Other Cars

6 PASSENGERS
38 HORSEPOWER
115-INCH WHEELBASE
LEFT-HAND DRIVE

The Foreign Trend

The builders of motor cars abroad are constantly introducing new idcas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street **NEW YORK CITY**

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

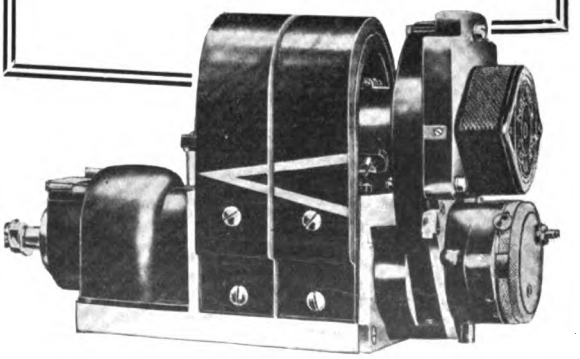
EISEMANN

All eleven Eisemann Ignition Systems completed the recent Indiana-Pacific Tour without a single mishap, each giving one-hundred per cent. perfect performance for the entire distance.

When an automobile ignition system has reached the degree of perfection necessary to undergo successfully the most severe test ever attempted, it is not to be wondered that eleven of the nineteen cars entered relied upon Eisemann for their ignition.



When a system of ignition has earned by merit alone the practical endorsement of as many motor car manufacturers as have adopted and are now using Eisemann Ignition for their cars, it is time others looked into the merits of Eisemann Ignition for their cars.

Dixon's Graphite Transmission Grease No. 677

The gear teeth in your transmission and differential wouldn't wear out if they were not rubbing one upon another. The use of Dixon's No. 677 puts a layer of pure graphite over the metal surfaces—a surface that is unctuous and almost frictionless. And instead of a quick-wearing metal-on-metal grinding, you have a long-lasting graphite-on-graphite gliding. The results appear in lower repair bills, and a more lively car. Let us send "Lubricating the Motor," No. 23.

Swinehart
Non-Skid Tires

The one type that makes skidding impossible. Both the initial cost and the repair expense of chains and inevitable wear and tear on the fabric of the casing are avoided, representing more than 30% of total tire costs. Swinehart (Keaton) depression type has four times the wearing surface of any other non-skid, and its traction and non-skid properties last until the tire is worn out. Safe and economical.

No more fear of rim troubles when you ride on Diamond Tires

When you ride on Diamond Tires you need have no fear of rim troubles.

Diamond (No-Clinch) tires are built with Perfect 3-Point Rim Contact that fit and hold the rim with a vise-like grip. This perfect rim fit means perfect balance—means that the tire is fighting the *road*, not the *rim*—insuring immunity from all forms of rim troubles, including cutting and breaking above the bead.

The annealed steel cabled wires imbedded in the bead form a rigid ring of support that holds in every emergency, permits proper inflation and positively prevents tire from creeping or slipping off rim.

Vitalized Rubber

Diamond {No Clinch} Tires

built with more air-room

It's the extra air-room that does the work. The more air-room the more resiliency, with less racking and jolting of your engine and car—which, in turn, means more comfort for you and your guests—*more comfort for your tires.*

All Diamond Tires are now made of Vitalized "More Mileage" Rubber, with Perfect 3-Point Rim Contact, No-Pinch Safety Flap and, if you wish, the now famous Safety (Squeegee) Tread.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims from

Cross Section, Diamond Safety Tread Tire

Be a Diamond Dealer If you are not a Diamond Dealer now is the time to get in line. There is a Diamond Branch near you—get in touch today.

KLAXON

"Electric horn" does not mean Klaxon

PUBLIC demand has forced every car manufacturer to equip with an electric warning signal.

If the signal is not a Klaxon, it is referred to in the maker's advertisements and catalogs as an "electric horn." The name is never mentioned.

In a majority of such cases, the makers are putting on the cheapest signal they can buy, merely to be able to advertise "electric horn" in their equipment.

Most of these are "vibrators"—similar in construction to "buzzers" used in offices and dining-rooms. Their note is neither powerful nor danger-expressing. Often not as much so as the old bulb-horn. The principle on which they operate renders satisfactory service impossible except for a short period when new.

KLAXONIZED CARS

A. E. C.	Metallurgique
Alco	Mors (*European*)
Armleder	Multiplex
Autocar	National

KLAXONS cost from two to eight times as much as "electric horns." All of the best, the well known cars, are Klaxonized. Their makers believe that it pays them to spend this extra money for an accessory recognized as STANDARD. They say "Klaxon"—not "electric horn."

Here's the Book the Dealers Asked for

How Many Do You Want?

WHEN a customer asks for information regarding rim-equipment, just hand him a Stanweld Book.

It will please him and save you considerable time, because the book contains information that car-owners are continually asking for.

There is nothing lavish about the Stanweld Book, but it's chock-full of rim-information, and that's what you and your customers want.

Send a letter or postal asking for as many copies as you need. We may not be able to send them all immediately, but we'll send as many as the present quantity permits.

GRAY & DAVIS
STARTING-LIGHTING SYSTEM

Gray & Davis electrical equipment adds to the intrinsic and service value of any car. It is final and highly standardized in design and manufacture. It is the veteran in the field where volunteers are the rule.

A Highly Efficient Dynamo

Since the inception of electric lighting for automobiles the Gray & Davis Dynamo has been used by leading motor car manufacturers. Its experimental stage was over with five years ago. It is not a converted generator, but a real dynamo doing a real dynamo's work. It is a 6-volt, constant speed machine. The voltage never varies. The service never fails.

The Starting Motor

The Gray & Davis Starting Motor is used by leading automobile manufacturers, 32 in all having endorsed it. It is not a makeshift nor a rushed-through device, built hurriedly to meet the demand for electric starters. You will find it on most of the better cars. It works, without "ifs" or "buts," continuously cranking the heaviest engine even if the thermometer drops to zero.

Simplicity in Design

Complicated wiring—there's the rub in much electric equipment. The Gray & Davis Starting-Lighting System is exceedingly simple. It has no complicated or involved controls. Press the pedal and the engine hums. A simple switch controls the lamps. The whole system is built for the layman.

YOU OWE IT TO YOURSELF TO INVESTIGATE THE GRAY & DAVIS STARTING-LIGHTING SYSTEM. OUR CATALOG AND FULL INFORMATION WILL BE SENT ON REQUEST.

GRAY & DAVIS, Inc., Boston, Mass.

New Automatic Shock Absorber Gives Motoring Comfort a New Meaning

The standard of car comfort has been raised. Manufacturers today are making extra provisions for the motorist's comfort. Deeper upholstery, longer springs and larger tires have all helped in making easier riding cars.

But the greatest step in the perfection of motor car comfort has been the New Automatic Truffault-Hartford Shock Absorber.

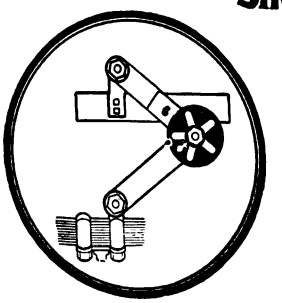
Without it the motorist cannot realize the utmost motor comfort. It is as much a necessary part of each spring as the carburetor is of every engine.

Chief among the advantages of this new type of the famous Truffault-Hartford are its three frictional tensions, providing a separate spring control for every kind of road.

The first of these tensions, very slight, exercises the proper degree of absorption needed to take up the small but disagreeable spring oscillation generated by the car's speed on comparatively smooth roads. It does not encumber full play of the spring.

A second tension comes into play when the roadbed grows moderately rough. It offers a frictional resistance that meets this new demand to a nicety, continuing to maintain normal spring action.

A third tension responds to a change from smooth or moderately rough roads to roads of extreme roughness. This last tension is an absolute guard against jolts and jars that occur when the wheels hit a car track, cross-walk or culvert at high car speed.



All tensions respond with unfailing regularity. The New Automatic lengthens the life of the tires, prevents spring breakage and brings unsurpassed ease of riding.

Any car, no matter how stiff or flexible its spring equipment is easily fitted with the

Capsheaves in the Harvest of Firestone Victories

At Indianapolis this year the capsheaves were placed in the great harvest of victories for Firestone Tires when they took First and Second places in the 500-Mile International Sweepstakes — the only cars in the race equipped with Firestone Tires—representing 100 per cent victory.

All the other big racing events of the year were also won by Firestone Tires — Panama-Pacific Road Race, July 4; Montamara Festo Races, July 5 and 7; Santa Monica Race, August 9; and Corona Race, September 9.

In winning these victories, Firestone Tires have withstood every condition that cruelly tests a tire.

Such triumphs over all leading makes of both America and Europe —when tire strength meant success and fame, and tire weakness meant failure—completely prove the correctness of Firestone materials and building principles.

Wrapped tread construction — the two-cure process that allows rigid inspection in the course of manufacture—the elimination of defects that cause tire breakdowns —the process that, by means of open steam vulcanizing, gives a tread-toughness and wear-resistance unapproached—these principles have made Firestone supremacy possible.

Firestone tread-toughness and greater tread-thickness are prime factors in Firestone success. An inspection of cross sections shows that these elements actually exist in Firestone.

Why not let these proved features, plus the abundance of measure in Firestone quality and materials, roll up big mileage scores for you—lower your tire cost per mile—bring to you all the benefits and advantages that Firestone users enjoy?

MOTOR WORLD

Vol. XXXVII New York, U. S. A., Thursday, October 2, 1913

TIRE MAKERS TO BE AMONG ABSENT AT NATIONAL SHOWS

Take Unexpected Action and May be Joined by Makers of Bearings—M. A. M. Declines to Sanction Boston Accessory Display.

Tires, which for so many years have constituted one of the most conspicuous displays in the accessory department of the National shows in New York and Chicago, in all human probability will be even more conspicuous by their absence from the shows of next January. For it has just become known that the tire group of the Motor & Accessory Manufacturers, Inc., has reached an agreement not to exhibit at either New York or Chicago.

While it is not known that the bearing manufacturers who are members of the M. A. M., and who do not comprise what is known as a "group" in that association, have reached an agreement of any sort, it is understood also that few of them will exhibit their productions at either of the forthcoming shows.

Although the absence of the tire people particularly will mean the absence of many proud names which have appeared at the shows since their inception, the decision of the tire makers to be "among the missing" themselves is not wholly surprising. It is known that, like many other manufacturers of parts and accessories, they have obtained comparatively no real benefit from their displays and that each of them has participated in the shows largely because of knowledge that the "other fellow" intended to display, and for such passing advertisement as they might secure. It undoubtedly was these circumstances that had most to do with the decision of the tire producers.

It was anticipated that, like the car makers comprising the Automobile Chamber of Commerce, the Motor & Accessory Manufacturers would meet today for the purpose of allotting their space at the National exhibits, but the meeting of the latter has been postponed one week, or until Thursday next, 9th inst. Despite the withdrawal of the tire manufacturers, however, it is stated that the M. A. M. will take all the space which has been set aside for their occupancy at both New York and Chicago.

Incidentally, it has just become known that the M. A. M. for the first time has refused to sanction the Boston show, and while it is possible that pressure which is being brought to bear may influence a change of the decision, it is more likely that the Boston exhibition will have to get along without M. A. M. approval.

Johns-Manville Acquires Soot-Proof Plug.

Soot-Proof spark plugs henceforth will be marketed wholly by the H. W. Johns-Manville Co., of New York, which has acquired a substantial interest in C. A. Mezger, Inc., which established the Soot-Proof plug on its present high plane. The deal was wholly unexpected, owing to the fact that the Johns-Manville company only recently undertook the manufacture of a plug of its own, but it is believed that the superior selling facilities of the latter will do much to enhance even the present large sale of the Soot-Proof. The Mezger factory, which is located on the outskirts of New York City, will be continued in operation but will have absolutely nothing to do with the sale of its product.

Why it Will be Houk Manufacturing Co.

Houk Manufacturing Co., and not Houk Wire Wheel Co., as first proposed, will be the new title of the McCue Co., of Buffalo, the control of which, as stated in last week's Motor World, has been acquired by George W. Houk, of Philadelphia. While wire wheels will constitute the bulk of production, the fact that axles and forgings comprise a not insignificant department of the business led to the substitution of "Manufacturing" for "Wire Wheel" in the corporation's name.

END OF WEEK MAY SEE MU REVISED TARIFF MADE

House and Senate Reach Agree and Make $2,000 Dividing Lin Car Classification—"Dumpin Clause" not Retained.

Points of disagreement having bee onciled by the conference committees House and Senate, the Underwood tar is now in shape for final passage and, probability, will be enacted before the of the present week. As President W will immediately attach his signatu will become a law and the reduced ra into effect at once.

In the final overhauling of the bi conferees again altered the rates ap to automobiles, or, more correctly agreed on other classification. Ori the House provided a tax of 45 pe on finished automobiles, 30 per ce chassis and 20 per cent. on parts, t isting duty being 45 per cent. on all productions. When the bill reache Senate the finance committee of tha disagreed so widely with the House provide a distinct classification of a biles according to their value, the committee providing the following Finished automobiles at $1,500 or o per cent.; at less than $1,500 and mo $1,000, 30 per cent.; at less than $1, per cent.; chassis and parts, 30 per which rates were adopted by the Sen August 5th after two hours' discussio

Before the conference committees houses got together they reconcile differences, so far as automobiles a cerned, by drawing the line at $2,0 duty on cars valued at $2,000 an being maintained at the present r per cent., while cars of lesser valu reduced to 30 per cent. Chassis an were permitted to stand at 30 per c is these rates which will be enacted.

There was no disagreement on tir

Digitized by Google

duty on which will be reduced from 35 to 10 per cent.

Anti-friction balls for bearings, which constitute one of the items which are largely imported, are reduced from 45 to 35 per cent. and chains from 46.59 to 25 per cent.

One of the unexpected outgrowths of the Congressional conferences was the elimination of the "dumping clause" which originally was incorporated in the House bill and which provided that when the price at which goods are consigned to this country is less than the price at which they are sold in the country of their manufacture an additional duty, equal to the difference in the two prices, shall be levied. The House conferees fought hard for its retention, but finally surrendered.

Categorically, the duties which apply most directly to the automobile industry are as follows:

Article.	Old rate per cent.	New rate per cent.
Automobiles, value over $2,000	45	45
Automobile bodies	45	45
Automobiles, value under $2,000	45	30
Automobile chassis	45	30
Automobiles, finished parts	45	30
Axles, and parts thereof	14.90	10
India rubber manufactures, known as gutta percha (tires)	35	10
Anti-friction balls	45	35
Forgings	30	12
Bolts, iron and steel	20.59	10
Nuts and nut blanks	6	5
Nut washers	6	5
Spir.l nut locks and nut washers	New	30
Iron castings	28.31	10
Malleable iron castings	13.58	10
Sprocket and machine chains	46.59	25
Tubes, pipes and flues	29.37	20
Cylindrical or tubular tanks	30	20
Files, machine cut	60.47	25
Files, hand cut	60.47	25
Steel rivets, studs and points	44.30	20
Aluminum, crude	56.41	*2c.
Aluminum plates, bars, etc.	55.16	*3½c.
Metallic mineral substances	20	10
Nickel and nickel oxide	15.96	10
Nickel sheets or strips	35	20
Machine tools	30	15
Machinery	45	20
Other iron and steel manufactures	45	20
Manufactures of Asbestos	25	20
Asbestos, unmanufactured	Free	Free
Mica, unground, value under 15c. per pound	34.62	*4c.
Mica, unground, value over 15c. per pound	34.62	*25c.
Mica, cut, and mfrs. of	34.62	*30c.
Earth and mineral wares, not decorated	35	20
Carbons, unmanufactured	20	15
Lava tips for burners	10c. gr. & 15	15
Bone dust, meal and ash	Free	Free
Leather, grained, buffed, split	7½	Free
Other leather	15	Free
Crude India Rubber	Free	Free
Vulcanized rubber manufactures	35	25

Tire fabric or fabric suitable for use in pneumatic tires, and fabrics with fast edges not exceeding 12 inches in width, all of the foregoing made of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, or of cotton or other vegetable fiber and india rubber, 25 per cent. ad valorem.

*Per pound.

Receiver Will Sell 40 Schacht Vehicles.

Forty finished vehicles, comprising 15 touring cars, 6 roadsters, 15 trucks and 4 delivery wagons, are included in the property of the Schacht Motor Car Co., of Cincinnati, which the court has ordered sold by the receiver at public auction on Monday, October 20th. The assets also include a considerable supply of parts and accessories, to say nothing of both metal and wood working machinery.

GOODYEAR AGAIN DECLARES REPORT OF MERGER UNTRUE

Repudiates Oft-Recurring Rumor of Alliance with Big Tire Interests—Cites Volume of Business as Substantial Proof.

Expressing the hope that it will "dispose for all time of such groundless rumors," F. A. Seiberling, president of the Goodyear Tire & Rubber Co., has issued a statement amplifying his denial of the recurring stories that his company is to be taken over, merged or in some way controlled by the United States Rubber Co.

"There is not now and there never has been any negotiation of any sort between Goodyear and any other company," he says. "There is not the remotest likelihood that there ever will be.

"The Goodyear Tire & Rubber Co. is just now completing the largest year's business in its history. Its sales for 1913 will pass the $33,000,000 mark. This, compared with our total of $26,000,000 for last year, shows the strides that Goodyear is steadily making. The prospects for 1914 indicate continued substantial growth.

"We have supplemented our tire line with a complete mechanical goods department, thus balancing our product, and are prepared to continue as we have been doing.

"I trust that this statement will settle once for all the groundless rumors that have been circulating of late. All these reports are inspired, are intended to injure us and can certainly do no one any good except, perhaps, the stock jobbers. Ours is an organization of young men who have made Goodyear the largest single producer of automobile tires, truck tires, motorcycle tires and carriage tires in the world, and I trust that it will be many years before that organization loses its splendid energy and vigor. Our capital is small. There is not one dollar of watered stock in our company. We are well satisfied with our present position and propose to continue to operate independently and with a free hand."

National's Best Year; Officers Reelected.

After listening to reports showing that during the fiscal year ending September 1st the company had enjoyed the best twelve-month in point of sales and profits in its 14 years' existence, the stockholders of the National Motor Vehicle Co., of Indianapolis, have not only reelected all of the directors but so flattering are the reports that they expressed their satisfaction in a resolution of thanks and congratulations.

The directors reelected are as follows: A. C. Newby, Robert Martindale, P. E. Manchester, William Guy Wall and George M. Dickson. These directors in turn reelected all of the officers, as follows: A. C. Newby, president; William Guy Wall, vice-president; George M. Dickson, secretary, treasurer and general manager.

McFarlan "Six" Avoids Embarrassment.

Failure of the McFarlan Carriage Co., of Connersville, Ind., which made the McFarlan "six" car, has caused the McFarlan Motor Car Co. to take over the production of that model. Previously the Motor Car company handled only the sales and service ends of the business, and to better serve its larger purposes the McFarlan Motor Car Co. was incorporated under the laws of Indiana with a capitalization of $100,000. A. H. McFarlan, president of the company, states that the new arrangement will permit dealers and owners to be served in better shape than ever before. The petition in bankruptcy against the McFarlan Carriage Co. was filed Friday last, 26th ult., by the Indiana Lamp Co., the Ansted Spring & Axle Co. and the Scheidel & Thompson Mfg. Co.

Willys Purchases a Ball-Bearing Plant.

Hereafter the Willys-Overland Co., of Toledo, will manufacture its own ball bearings. This brings it one step nearer the consummation of the Willys policy of constructing everything which goes into Overland cars. To that end, the Willys-Overland Co. has purchased the Globe Ball Bearing Co., of Norwich, Conn., the entire machinery of which will be transferred to Elmira, N. Y., where it will be operated, in the production of ball bearings, by the Morrow Mfg. Co., one of John N. Willys's several subsidiaries.

Invites New Bids for Cutting Property.

Having rejected the bid of $30,000, made by W. M. Thompson, of the Jackson City Bank, for the assets of the Cutting Motor Car Co., of Jackson, Mich., the court has authorized the receiver to invite sealed bids up to Monday next, October 6th. It is specified that bids must be not less than $30,000 and the assumption of encumbrances amounting to approximately the same amount. On September 22nd last, the appraised value of the Cutting property was $172,969.17.

Goodrich Abandons Canadian Project.

There will be no B. F. Goodrich factory in Canada, after all. Several months since it was stated that the big Akron company had acquired a site across the border, and it is known that plans for the erection of a factory were in hand, but, meanwhile, circumstances have altered cases and the project has been postponed indefinitely.

BARBER "BOBS UP" WITH A PATENT ON A SPARK PLUG

Brings Suits Against Three Dealers for Selling Three Different Brands —Claims Rights to Much Used Two-Piece Insulation.

Although the three manufacturers concerned had heard little of William Barber, of Brooklyn, N. Y., prior to yesterday, 1st inst., he introduced himself into spark plug circles at that time in no uncertain terms by filing three patent lawsuits in the United States District Court for the Southern District of New York; he claims a basic patent on the type of plugs which bear the names Red Head, V-Ray and Sootless and demands an injunction, accounting and damages.

Barber is a sort of free lance inventor and took out a patent June 30, 1903, under the number 732,032 on a plug wherein the porcelain is inside the bushing at the ignition end and extends part way back through the plug toward the cable end. The remainder of the insulating material is specified as being of some substance less brittle than porcelain. He never engaged extensively in manufacture, although he is said to have produced a few plugs.

This week he began litigation against three New York City accessory and supply dealers—Frederick Ray, F. Arthur Haines and Daniel R. Smith, who trade as Smith-Haines at 1761 Broadway, the Motor Car Equipment Co., of 240 West 56th street, and the Lowe Motor Suppplies Co., of Broadway and West 55th street. The charge is that Smith-Haines sold V-Ray plugs, the Motor Car Equipment Co. Sootless plugs and the Lowe company Red Heads.

The cases are largely in the nature of a test and will probably be defended principally by the manufacturers, who are: V-Ray, the M. M. M. M. Co., of Marshalltown, Ia.; Sootless, the Oakes & Dow Co., of Boston; Red Head, the Emil Grossman Mfg. Co., of New York City.

Private Sale of Michigan Buggy Assets.

Although the trustee, the Detroit Trust Co., favored public auction of the assets of the Michigan Buggy Co., of Kalamazoo, the Federal court, in the person of Judge Sessions, has ordered the property disposed of at private sale. Sealed bids, as a whole or in parcels, will be reported to Judge Sessions in the Federal court in Grand Rapids tomorrow, 3rd inst.

Previous to the action of the court, E. F. Gerber, of Pittsburgh, one of the largest agents for the Michigan car, made two separate offers for the property, both of which, however, were rejected. He, however, has incorporated a Michigan Motor Car Co., under Delaware laws, with an authorized capital of $1,000,000, and will make another offer for the property.

Willys Himself Again Assumes Reins.

Due to the death of George W. Bennett, vice-president and general manager of the Willys-Overland Co. and the Willys subsidiaries, John N. Willys himself has reassumed the active management of all those interests which, during the past year, he had left largely in Bennett's hands while devoting himself to his financial affairs.

C. F. Jameson, one of the Willys sales managers and Bennett's chief assistant, has, however, been promoted and will have entire charge of the sales of all of the Willys companies. He also has been elected a director and invested with the title of second vice-president. H. B. Harper, former export manager, also has been elevated to the sales management of the Willys-Overland Co., and D. W. James to the post of assistant to the president.

Willys, of course, retains the office of president of all of the companies of which he is the owner. The first vice-presidency, previously held by Bennett, has been filled by the election of Isaac Kinsey. Jameson, as stated, is second vice-president. The other officers are Walter Stewart, treasurer, and Royal R. Scott, secretary.

Jeffery-Dewitt Increases to $500,000.

In order to permit of enlargement, the Jeffery-Dewitt Co., of Detroit, has been reincorporated under the laws of Maine with an authorized capital of $500,000. Practically all of the stock has been subscribed for and none will be offered to the public. Part of the Jeffery-Dewitt Co. enlargement is taking the form of a three-story building, 200 x 53 feet, which is in course of erection, and also two additional kilns to provide for the manufacture of porcelain insulators of all kinds, the company having decided to produce such insulators for general electric purposes, for plumbers' use, etc.

Two Small Bids for Midland Assets.

For the property of the Midland Motor Co., of East Moline, Ill., appraised at $107,376, only $43,500 was offered at the receiver's sale last week. It was put on the block in two parcels, For one, including 13 acres of land, buildings and stationary equipment, George W. Johnson, of the Moline Furniture Co., offered $17,000. For the second lot, which includes the machinery and stock on hand, S. M. Wintrenitz, of Chicago, who makes a specialty of purchasing such bankrupt property, bid $26,500. If the sale is approved by the court, it will net the creditors only about 12 per cent.

AMERICAN POSSESSIONS BUY MORE CARS FOR LESS MONE

Increase Number Purchased by 10 p Cent. but Average Price is Lower — Phillipines Leads in Volume and Gain.

While the non-contiguous American pc sessions, which are not included by the Fe eral statisticians in their tabulation of e ports to foreign countries, given in Mot World last week, increased the number cars they purchased from the parent cou try in July of this year by 10 per cent., t lesser value per car resulted in a decrea of 7 per cent. in the value of the cars. T gain of July, 1913, over July, 1912, was cars, but the value was less by $13,878.

The average value in July a year ago w $1,878 and last July $1,588, a drop of $2 or 15 per cent. The Philippines rank fi as buyers of cars in July last and also r cord the greatest gain, taking 21, or 68 p cent., more cars and increasing the value $21,315, or 41 per cent. Alaska gained, al while Hawaii and Porto Rico entered t loss column. Parts decreased by $5,874, 28 per cent. For seven months ending w July, 1913, the gain in cars was 92, or per cent., and in value $39,168, or 3 per ce as compared with the same period of t preceding year.

Engines and tires are not included in t parts allotted to each of the possessio and the statisticians give only the shipme of tires to Hawaii and Porto Rico. Th figures are: Hawaii, July, 1912, $35,228; Ju 1913, $35,338; loss, $110. Porto Rico, Ju 1912, $10,955; July, 1913, $21,346; gain, $1 391.

The figures in detail for the month July and for the seven-month period are follows:

	July 1912 No.	July 1912 Values.	July 1913 No.	July 1913 Valu
Hawaii—Cars	47	$83,734	32	$67,
Parts*	..	10,431	..	7,
Porto Rico—Cars	23	53,454	22	32,
Parts*	..	5,834	..	6,
Philippines—Cars	31	51,016	52	72,

BANNER YEAR FOR GENERAL MOTOR; PROFITS $8,100,000

Gross Sales Exceed $85,000,000 and Undivided Earnings Increased by Nearly $3,600,000 —Ten Unprofitable Units Eliminated.

During the fiscal year ending July 31st the gross sales of the General Motors Co. amounted to $85,603,919.85, of which $8,284,139.79 is net profit. After paying 6 per cent. interest on first lien notes, and the preferred dividend of 7 per cent., the undivided profits for the twelvemonth were $6,410,937.28, making "by far the most successful year in the company's history," according to the annual report just issued.

In 1912 the gross sales amounted to $64,744,496.02, of which the net profit was $4,838,448.65, which, after paying interest and dividends, made the undivided profits $2,856,082.76.

In rendering the report, President Nash states that the "schedule of production for the coming year has been somewhat increased," but as it cannot be predicted whether the partial failure of this year's crops in certain parts of the West may not affect the sale of cars, arrangements have been made to meet such possible shrinkage, should it occur.

The total assets of General Motors and its subsidiaries are $58,538,160.02, as against $54,958,158.60 at the close of the 1912 year. The liabilities, including the outstanding capital stock, totals the same amount, of which $5,775,305.01 is represented by "reserves for special purposes" and $2,945,379.47 by surplus. For 1912, the corresponding items were $4,299,371.56 and $1,262,598.88, respectively.

The favorable showing was made despite the fact that during the twelvemonth several unprofitable companies, whose operations resulted in losses, were discontinued, and also after deducting $1,098,482.56 for depreciation of buildings and equipment.

As a result of the pruning process, the number of active companies comprising the General Motors organization has been reduced from 24 to 14, those remaining in operation being as follows: Buick Motor Co., Cadillac Motor Car Co., Cartercar Co., Champion Ignition Co. (spark plugs), General Motors Export Co., General Motors Truck Co., General Motors (Europe), Ltd., London, Eng., Jackson-Church-Wilcox Co. (steering gears), Michigan Motor Castings Co. (castings), Oakland Motor Car Co., Olds Motor Works, Northway Motor & Mfg. Co. (engines), McLaughlin Motor Car Co., Ltd., Oshawa, Can., and the Weston-Mott Co. (axles).

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

G. F. McCurdy has been appointed sales manager of the Westcott Motor Car Co., of Richmond, Ind .

F. R. Pendleton has been appointed eastern sales representative of the Thomas Motor Car Co., of Detroit, maker of the Thomas truck. Previously he was with the General Motors Co.

F. L. Semple has been appointed sales manager of the Wagner Oil Co., of New York. Previously he served the Havoline Oil Co. in a similar capacity.

W. E. Raiguel, its sales manager, has been elected secretary of the Disco Co., of Detroit, to fill the vacancy caused by the resignation of George B. Sweet.

Edward Copeland has been appointed general manager of the Corcoran Lamp Co., of Cincinnati. Previously he was purchasing agent of the General Motors Co.

A. L. McLeod, of Chicago, who for 18 years was with Charles Scribners' Sons, has joined the staff of the Jeffery-Dewitt Co., of Detroit. He will have general charge of the company's porcelain sales.

Fred A. Cornell, former sales manager of the Willys-Overland Co., has been added to the sales staff of the Splitdorf Electrical Co., of Newark. In addition to his Overland experience, Cornell also has served with the Timken Roller Bearing Co.

C. C. Bradford, former manager of the Cleveland branch of the United States Lighting & Heating Co., has been promoted to the post of sales manager of the company with offices at 30 Church street, New York City. The vacancy in Cleveland has been filled by the appointment of R. B. Clark as acting manager.

W. B. Fewell, who relinquished the management of the Oakland Motor Car Co.'s New York branch when it was taken over by the Sidney B. Bowman Automobile Co., has been appointed manager of the Oakland branch in Boston. He is no stranger to that vicinity, having been at one time manager of the Olds establishment in that city.

Walter I. Jordan, former manager of the Detroit branch of the Hoffecker Speedometer Co., has joined the staff of the Empire Automobile Co., of Indianapolis. He will serve as assistant to Commercial Manager Hood but will spend most of his time on the road.

Minor Business Troubles.

The Morse-Readio Co., of Springfield, Mass., a garage operator and dealer, has assigned to Frederick J. Hillman of the New England Auditing Co. The liabilities are $34,500 and the assets $47,295. Nearly all of the indebtedness is secured. The reason for the assignment is said to be the discontinuance of the manufacture of Alco cars, which it handled.

Dr. B. D. Bundy has been appointed receiver for the Crescent Motor Truck Co, of Middletown, Ohio, which was organized about a year ago but which cut little figure in the industry. The petitioning creditors allege that the company is heavily in debt and constantly losing money and they, therefore, pray that the assets be sold and the proceeds applied to the indebtedness.

The Omaha Motor Car Co., of 4311 North 20th street, Omaha, Neb., which set out to manufacture the Omaha car but did not make many of them, has filed a petition in bankruptcy; the liabilities are $46,908 and the assets $10,140, consisting of six finished cars, several unfinished cars, tools and office furniture. Among the creditors are: Walter Moise, $29,380, money loaned; the W. L. Huffman Co., $8,000; State Bank of Omaha, $5,000, on a promissory note. E. E. Howell is the company's president.

Recent Losses by Fire.

Arctic, R. I.—Lewis Bentley; garage destroyed. Loss, $1,800.

Red Bank, N. J.—L. C. de Covet; garage and stable destroyed. Loss, $25,000.

Flint, Mich.—Automobile Exchange, 514 North Saginaw street; building destroyed. Loss, $5,000.

Boston, Mass.—Cambridge Electric Light Co., Western avenue; garage destroyed. Loss, $6,000.

New Orleans, La.—H. W. Johns-Manville Co.; building damaged. Loss, building, $20,000; contents, $55,000.

South Deerfield, Mass.—Fisher's Garage; garage and one car damaged and $300 worth of tires destroyed. Loss not stated.

Output Sold, Benson Predicts Bigger Year.

The Studebaker output for next year has been entirely contracted for, according to a public announcement of Sales Manager Benson. In making the statement, and as a result of his recent swing around the trade circle, Benson couples with it the prediction that the year 1914 will be even better than is the present twelvemonth from the standpoint of sales of Studebaker automobiles.

In the RETAIL WORLD

R. Boermer, of Thiensville, Wis., is about to build a garage.

W. H. Knarr is erecting a garage in Beloit, Wis. It will cost $8,000.

J. J. Fairchild, of Turlock, Cal., has secured permission to erect a garage.

Jesse Kirby, of Smith's Grove, Ky., is erecting a garage and machine-shop.

The Wood Auto & Machine Co., of Carrollton, Ky., is erecting a new shop building.

Stewart Dorsey, of Carlisle, Ky., has broken ground for a garage and machine-shop.

C. N. Harp, of Syracuse, N. Y., will erect a garage at Sylvan Beach, in the same State.

Thomas Maddock, of Superior, Wis., has commenced the construction of a garage; it will cost $9,000.

Charles Springer is erecting a garage in Wheeling, W. Va. It is located at 85 16th street, East End.

The Biggs-Brown Oil Co., of St. Louis, has secured new quarters; they are located at 500 Theresa avenue.

Barr Bros., of Ulrichsville, O., plan to erect a new garage; their former building was destroyed by fire.

F. C. Arnold has purchased a half-interest in the Stockton (Cal.) Garage; Capt. Jensen formerly was sole proprietor.

Roy Brown, of Wilmington, O., has sold his garage to H. D. Pennington; the style of the business is Brown's Garage.

Philbrick, Mather & Co., of Baraboo, Wis., have purchased the garage and business of the Square Deal Auto Co.

The Anselm Ganahl Motor Car Co., of St. Louis, has leased new salesrooms at 1512 Locust street; the company handles Regals.

Asire & Palmer, of Marquette, Mich., have taken possession of new salesrooms; they are located in the new Colonial building.

The Quinn & Clark Motor Co., of Westfield, Wis., has broken ground for a garage, to cost $9,000; the company handles Fords.

Isaac R. Wilson, of Madison, N. J., has opened a garage on King's road; he also has admitted Walter S. R. Schultz to partnership.

George Schuback, of Logansport, Ind., is about to open a garage; he has leased a building just erected on Front street by Elliott Uhl.

John B. Shea, of Holyoke, Mass., is about to enter the garage trade; he has purchased and will remodel a building at Dwight and Elm streets.

W. B. Hall, J. H. Ward and R. W. Eddleman are erecting a fireproof garage in Du Quoin, Ill. Hall is also engaged in the rea. estate business.

Fred and Roy Roff and Jacob Thompson, of Spirit Lake, Ia., have secured plans for a new garage; it will stand on the site of the Chisholm building.

Thomas F. Morris, Jr., has entered the trade in Birmingham, Ala. He styles his business the Automobile Exchange and will specialize in used cars.

Ben Braham, of Kellogg, Ida., plans to erect a garage; he has secured a site on McKinley avenue and estimates that the building will cost $7,000.

E. A. Brandes, of Grand Island, Neb., has sold his garage to John C. Thompson, formerly of Edgar, in the same State; Thompson will operate it.

The Clinton Garage, of Wilmington, O., has sold its business, on Mulberry street, to the Wilmington Auto Co. The latter is a new concern and will handle Buick cars.

T. F. O'Laughlin, of Hartford, Conn., has been granted authority to build a two-story garage at 18 Park street; the application states that the cost will be $12,000.

The Hill Top Motor Car Co., of Cincinnati, has taken possession of new salesrooms at 960 East McMillan street; Goldberg & Phister are proprietors of the company.

Herbert H. Hewitt plans to enter business in Peoria, Ill., under the style Franklin Square Garage; he has secured a site on Fulton street and will expend $12,000 on the building.

The Overland Automobile Co., of St. Louis, has found it necessary to secure additional warehouse space; it has leased a one-story building, 100 x 100 feet, at 436-44 Theresa avenue.

J. P. Wise has opened a garage in Hazlehurst, Miss.; he also stocks accessories and Ford cars. He is the head of the J. P. Wise Mercantile Co., dealer in general merchandise.

The City Taxi Co. has been formed in Helena, Mont. Its equipment consists of two Case limousines and a touring car; Jacob Fisher, formerly with the Helena Cab Co., is manager.

W. W. Wood has taken over the Cedar Falls Garage Co. in Cedar Falls, Ia. W. H. Laing, the former proprietor, has left for the East and plans to reenter business in Baltimore or Hagerstown, Md.

The Southern Motor Car Co. has entered the trade in St. Louis; it has leased salesrooms at 306-8 North 12th street and will handle Haynes and Metz cars. J. D. Barth and B. C. Charles constitute the company.

Don Lee, Cadillac distributer in California, has opened a branch in Bakersfield; Walter Beall has been made manager. Lee, whose headquarters are in San Francisco, has other branches in Los Angeles, Sacramento and Pasadena.

The Automobile Distributing Co. has been formed in Toledo, O., with J. L. Bayless as manager; a location has been secured at 1011 Jefferson avenue. The company will act as a wholesale distributer of Regals in 18 northwestern Ohio counties.

W. F. Garnell and Charles Wegman, of Cumberland, Md., have formed the Automobile Repair Co., and have opened a repair-shop and garage at Front and Frederick streets; Garnell formerly was chief mechanic at Glissan's Garage, in that city.

Frank L. Mitchell, treasurer of the Mitchell-Lewis Motor Co., of Racine, Wis., and Otis C. Friend, its sales manager, have organized the Mitchell-Lewis Co., of Racine, Wis., with $10,000 capital. William H. Armstrong, assistant secretary of the company, also is a corporator.

The Bluff City Welding Co. has entered the trade in Memphis, Tenn., at 419 South 2nd street; it employs 20 mechanics and is especially equipped for automobile repair work. The officers of the company are: President, Frank F. Fransioli; vice-president, Thomas E. Hubley; superintendent and manager, E. C. Ellingwood.

A. V. Davis and L. A. Hannan have formed the West Coast Puncturine Supply

Digitized by Google

Co. in Los Angeles and have located at 1351 South Main street; they will market Puncturine, a puncture repair compound. Hannan formerly was sales manager of the United Motors Co. in that city.

Hanselman & Dye Garage is the style of a new business in Sheridan, Mo. The company, which is capitalized at $1,000, will operate a garage, machine-shop and supply store in a building 45 x 80 feet. S. E. Hanselman, one of the proprietors, formerly was engaged in the trade in Waterloo, Ia.

The Chester Motor Car Co., of Nashville, Tenn., has secured permission to erect a two-story and basement garage, 50 x 169 feet, at 11th avenue and McGavock street; the exterior will be of pressed brick with stone trimmings and the showroom will have a front and partitions of plate glass. The structure will cost $15,000.

B. M. Calkins, formerly of Sycamore, Ill., and J. W. Murphy have formed the Calkins-Murphy Motor Co. and have taken over the business of the Mulick Motor Co., in Fargo, N. D. They have leased the Hector Barnes Garage, formerly occupied by the Northern Auto Co., and will handle Paige and Studebaker cars. The Northern Auto Co. will engage in the livery business.

E. Van Loo, of Waupun, Wis., has sold his garage at Main and Fond du Lac streets to E. A. Marsh, who has leased it to William Whiting, who will continue the business. The purchase price was $6,500. Whiting has conducted a garage and livery near the Van Loo Garage and will consolidate his interests in the latter location. Van Loo's retirement is occasioned by ill health.

The City Auto Corporation, of Pulask., Va., which recently incorporated, is erecting a garage, 50 x 121 feet, at 124-6 1st street northeast; it will house from 80 to 100 cars. The officers are: President, S. M. Lyon; vice-president and general manager, W. H. Wysor; secretary and treasurer, R. L. Gardner. The company has the Cadillac, Hupmobile and Ford agencies and will stock supplies and accessories. Wysor is but 17 years old.

R. A. Schwarzburg and J. J. Mack have formed the Schwarzburg-Mack Auto Co. in Milwaukee, Wis., and will handle the retail business in that city of the Creek Motor Sales Co., distributer of Oakland, Empire and King cars. The new company will have its salesrooms with the Creek company, which now is located at 228-32 Wisconsin street, but which will take possession October 15 of a new garage and service station at 447-49 Jackson street.

The Franklin Motor Car Co. of Boston has consolidated its sales and service departments, formerly located, respectively, at 733 Boylston street and 31 Irvington street, in a new building at 616 Commonwealth avenue; the company also has taken over the Harmon Automobile Co., of 24-30 Forest avenue, Portland, Me., and will make it a Franklin distributing point with William Chellis, formerly a Harmon salesman, as manager. The Harmon company formerly handled Franklins and has one of the largest and best equipped garages in Maine.

New Men and More Capital in Simplex.

At the annual meeting of the Simplex Automobile Co., of New York City, held last week, the capital stock of the company was increased from $1,000,000 to $1,500,000 and several changes were made in the officers of the corporation. Henry Lockhart, Jr., of Goodrich, Lockhart & Smith, New York bankers, succeeded C. T. Neubourg as president, and from the same financial concern C. C. Goodrich and J. Hopkins Smith, Jr., entered the board of directors. Besides Lockhart, the officers are: First vice-president, Otto Boessneck; second vice-president, J. Hopkins Smith, Jr.; secretary and treasurer, C. T. Neubourg. The directors include the officers and Hobart J. Park, G. L. Lansing, Robert Behr, John G. Dale, G. E. Franquist, C. C. Goodrich and Hugo Boessneck. Henry Broesel has been made service manager and Fred J. Titus, formerly with the Alco, manager of agencies. A new factory which the company recently erected at New Brunswick, N. J., will permit an increased production.

Grossman Removes to Brooklyn.

The Emil Grossman Co., which October 24 will become the Emil Grossman Mfg. Co., Inc., has consolidated the plants it formerly operated in New York, at 250 West 54th street, and in Detroit, at 844 Woodward avenue, in one of the Bush Terminal buildings in Brooklyn, at 41st street and 2nd avenue; the company occupies one floor, of 31,000 square feet. The new location affords, among other things, much better shipping facilities.

The Detroit location will be continued as a western branch. The company also has a porcelain plant of three kilns in Trenton, N. J. The company is probably best known as the manufacturer of Red Head spark plugs, although its line includes other automobile supplies and accessories.

Bay State Bars Several "Dead Ones."

For failure to file tax returns, as required by law, the Massachusetts Supreme Court has issued injunctions against the following concerns: Berkshire Motors Co., Consumers' Auto League, Inc., Fenway Auto-Top Co., Grant Motor Truck Co., Norwalk Motor Car Co. of New England, Stahle Mechanical Tire Co., United States Motor Vehicle Association, Inc., Expansion Spring & Rim Co. and the 35% Automobile Supply Co., practically all of whom have either failed or ceased to do business in that State. The injunction forbids any of them doing business in Massachusetts until they file the required report.

Misrepresented Himself as a Dealer.

C. E. Townsend, of Nash county, N. C. has been apprehended in Virginia on a charge of having secured money under the pretense that he was manager of the Norfolk Motor Car Co., of Norfolk, Va. It is charged that J. D. Bullock, of Nash county, paid to Townsend $250 with the understanding that he was to be a Brush dealer and would be sold ten cars at a discount of 15 per cent.

New York Jobbing House to Dissolve.

The Progressive Cycle & Automobile Co., of which Alexander Scaison is secretary and manager, and which has been doing business for some 10 years at 81 Chambers street, New York, is to be dissolved. A special meeting for the purpose has been called to occur on October 22nd.

Fiat Oils Absorbed by Rival Monogram.

The Pennsylvania Oil Works Co., with headquarters at 72 Front street, New York has been taken over by the New York Lubricating Oil Co. The latter will continue the Pennsylvania brand of Fiat oils, which will be marketed in connection with the Monogram lubricants.

Bigger Factory for Champion Plugs.

The Champion Spark Plug Co., of Toledo, Ohio, has let contracts for the erection of a new factory at Avondale and Upton avenues, in that city. It will be a four-story concrete structure, 60 x 120 feet, and will cost approximately $24,000.

Rubber Company Goes into Lubricants.

The W. D. Newerf Rubber Co., of San Francisco and Los Angeles, has secured the Pacific Coast representation for the full line of Invader lubricants. It will control their distribution in the States of California, Nevada, Utah and Arizona.

Paxson to Market Ohio Car Output.

C. D. Paxson, of Cleveland, who is marketing the output of Cleveland trucks, has also added to his account the Ohio cars made by the Crescent Motor Co., of Cincinnati. He will have entire charge of the company's product and sales.

Jiffy's President to Seek Health Abroad.

In an effort to restore his health, Frank Isle, president of the Jiffy Auto Curtain Co. of Detroit, is preparing to sail to Europe. He will be absent about four months.

Postage Stamps will be accepted in payment for subscriptions. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if adequate, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, OCTOBER 2, 1913

DO MAKERS HEED THE DEALER'S VOICE?

It would appear a fairly safe surmise that putting to dealers the question, "What can the manufacturer do for the dealer?" would bring the quick and fairly general response, "Give him a larger discount."

It, therefore, must have proved more or less surprising to at least most of those who have followed the series of interviews, printed in Motor World, which hinged on that question, that none of the dealers who have expressed opinions has even mentioned the word discount. It must prove equally surprising that, despite the comparatively mature age of the industry, and the fairly general practice of calling dealers into annual conferences, so many of them agree that their views have no weight, or, at any rate, so little weight.

This appears to be one of the chief burdens of complaint, which, in several instances, proves how widely divergent are the opinions of manufacturers and dealers on even such a subject as what constitutes the most desirable equipment or appointments, or whatever else those conveniences, or necessities, may be termed.

The dealer whose views are quoted elsewhere in this issue makes a strong and reasonable presentation of the dealer's case. He gives the engineer his due and evinces no disposition to project himself into engineering problems but, like nearly all of the other dealers previously interviewed, he regrets that the manufacturer so little heeds the dealer's voice. Being on the firing line, that is, in close and constant touch with the actual purchasers of cars, the dealers all believe they are competent to say what factors or features are of most influence in promoting or effecting sales, and that there is merit in the assertion none will gainsay.

The substance of the dealers' expressed opinions is largely a reiteration of the time-worn belief that "it is the little things that count," and all who have followed the salesmen's articles which have appeared, and are appearing, in Motor World's "Best Sale" competition, cannot but be impressed by the comparative trifles which so often weigh for or against a sale. While it is not possible to please everyone, Motor World's interviews go far to prove that there still remains room for more complete understanding between those who produce automobiles and those who sell them. How this understanding may be reached has been abundantly indicated by the interviews themselves.

LOGICAL SUBSTITUTE FOR LOCAL SHOWS.

"While little minds discuss, great questions solve themselves," is a saying old but true, which is another way of remarking that indications are not lacking that the National show situation appears to be rapidly solving itself.

It is fairly plain that the local show is perhaps less rapidly but none the less surely ceasing to be one of the greatest questions of the industry. Those who promote them have come to realize, or are being brought to a realization, that local shows are exactly what the term implies, shows of and by local dealers for local residents, and with the realization has come a lessening of the number of such affairs.

There are reasons to believe that if, in some cases, the dealers themselves did not personally share in the proceeds of such exhibitions, and were less impressed by the thought that they should be social functions, their number would be decreased still further and more rapidly. As for the free-lance exhibitions promoted by professional promoters, an end will be put to them whenever dealers realize that such promoters merely use them as "good things" and learn to answer with an emphatic "No" when the tempter casts his hook.

It is a fair assertion also that the whole local show question would be and can be answered, and be answered to better purpose, by exhibits of automobiles at the annual State or county fairs. There have been many such displays, and there should be more of them. They take the place of the present form of local show. Most of those who attend the so-called State or county fairs do so for the specific purpose of seeing whatever may be displayed, and usually their purpose is an earnest one. They care nothing for clothes or "society" and are in the mood to be shown and to be impressed.

If the truth were known, it probably would be found that more genuine prospects are obtainable at a county fair than at any local show that ever was or may be held. The most should be made of such displays.

"RED LIGHT" MEANS GARAGE IN TOWN OF WAR TIME FAME

Winchester's City Fathers Order Red Flag by Day and Red Lantern by Night at Garage Door—Other Results of Deliberations.

If Gen. "Phil" Sheridan were to repeat to-day his wild ride from Winchester, Va., down the Shenandoah Valley, he very likely would do it with his muffler cutout open and he would not have to hunt aimlessly for a garage from which to rent a car, for hereafter, according to an ordinance just passed in the village of historic and poetic fame, every garage must be marked in the daytime by a red flag and at night by a red lantern or some other kind of light—but it must be red.

Winchester has a population of 5,864, according to statistics, and the same authority accredits it with a couple of express offices, a money order post office, a telegraph station and a couple of railroads; more recent information is to the effect that the town also has a Common Council of ten members, and the council placed itself in modern history last week by adopting a garage ordinance.

Just because the town is not of metropolitan proportions is no indication that the ordinance was an inconsequential task—it was not. The debate attending its adoption was warm. One member of this law-making body proposed that every man who wishes to open a garage make application in writing and that the notice of the application be printed something like ten times in a newspaper in order that all objectors might be on hand to object. J. M. Steck was the father of that amendment, but Councilman L. F. Cooper went him one better and suggested that every prospective garageman get the consent of two-thirds of the people in his immediate territory; but the council decided that if this were made mandatory there wouldn't be any garages at all, for, they agreed, "the business is legitimate." Having conceded that the business has a right to exist, the law makers proceeded to explain how it might be operated.

After compiling a young book of rules on fireproofing and such things, the councilmen inserted in it the red lantern clause and, moreover, provided that no unnecessary noise shall be made at any time and that none at all shall be made between midnight and 6 A. M. and no unnecessary work performed on Sunday. No repairs shall be made outside the garage unless it be for the purpose of getting a crippled car in shape to be run into the garage, and no car shall stand in front of a garage for more than 20 minutes at a time.

Also, if a gasolene tank is to be filled it must be through a hose and not from a pail if the car is outside the garage in the street. Previous to crossing the sidewalk, entering or leaving a garage, a car must top and signal its approach. Every violation means a fine of from $5 to $25 and every day of violation is a separate offense. As a climax to the session, someone presented a petition. The spectators held their breath, but for no cause, for the paper was signed by people living near the Huntsberry Garage, on South Main street, saying they did not object to the garage. The council wiped its brow and adjourned.

New York Garagemen Reelect Officers.

Whereas the immediate object of the New York Garage Association, when it was formed a year ago, was a reduction in the price of gasolene, the association still continues as an effective working trade organization and last week entered upon its second year with an election of officers; the old roster was reelected, as follows: President, Louis J. Joscelyn, of the Joscelyn Garage; vice-president, William Burrows, of the Niagara Livery & Motor Car Co.; treasurer, George H. Reaney, of the Riverside Garage Co.; secretary, C. H. Potter, of the Uptown Garage.

The plans for the coming year include the contesting to a conclusion of New York City's ordinance which requires the installation of a gasolene separator, the formation of a credit list and the adjustment of gasolene and storage charges to a more consistent and profit-paying basis. The separator matter is now on its way through the New York Court of Appeals.

Kelsey Finally Drops Three-Wheeler.

C. W. Kelsey, one of the veterans of the trade, who organized the Motorette Co. in Hartford, Conn., about three years ago, and who acquired certain of its property after the company failed last year, has abandoned his efforts to reestablish the enterprise. Originally the Motorette was a three-wheeled "gas" driven vehicle, but quite recently Kelsey applied an electric motor to it and was proceeding along that line when he encountered obstacles which were too great to be overcome.

Bring Chicago Manager Back from London.

Extradition papers have been signed in the case of Albert Victor Webb, who was arrested in London, Eng., several weeks ago on the charge of having stolen $3,600 from the American Auto Supply Co., of Chicago. Webb was in charge of the Chicago company until May 31 when, it is alleged, he decamped with the funds in question.

HOW CAN THE MANUFACTURER HELP THE DEALER

By Consulting the Retailer on Appearance and Appointments—Harry Houpt Tells Why an Engineer Can Not Select, for Instance, a Carpet for a Prospect of the Wealthy Class.

"The public wants it that way," said the dealer.

"But I've spent years developing it this way," answered the engineer.

"It's good enough this way; the public ought to have it this way," decided the general manager, "therefore, let it be this way."

"Very well," replied the dealer. "Anyway, I suppose it makes me a more efficient salesman to have to sell people something they don't want."

What percentage of manufacturers in the trade follows such a course of procedure in turning out cars is problematical, but when Harry S. Houpt, one of the leading dealers in the metropolis, was asked, "What can the manufacturer do for the dealer?" his answer was aimed at the correction of such a policy; his answer embodied a whole principle rather than a mere correction of some detail of business.

Knows Car Maker's and Seller's Views.

Houpt is well qualified to discuss the problem in any phase, for he has been connected with the automobile trade from the viewpoints of both manufacturer and dealer. He has served as sales manager for a manufacturer and is now retailing cars as Harry S. Houpt, Inc. Neither does it mean that he is dissatisfied with his present connection, for the busy air about his establishment at Broadway and West 56th street is seldom found in a losing house. The answer is the summary of impressions gained in his entire experience with making and selling cars. Briefly expressed, it is: "Build from the standpoint of the dealer, not alone from that of the engineer."

"When you ask what the manufacturer can do to help the dealer you are putting a difficult question," said Houpt. "It is something a man does not always like to talk about for fear someone will think he is talking anonymously about the manufacturer whose cars he handles; but without hitting at anyone in particular, I believe I can make an answer to the question that will cover the situation in more than one factory. It may be said to be a condition which has grown up with the automobile business and one which, in my estimation, could easily be corrected and with great advantage to both manufacturer and dealer.

"The condition to which I refer is not one of the mere retailing of cars, but goes back farther than that; it goes away back to the beginning of the manufacturing process. I believe the manufacturer could best serve the dealer by having the engineer confine his attention to and exercise his authority in the construction of the chassis—and no more.

Engineer Most Capable in His Field.

"The engineer is well qualified to handle the intricate problems which are met in the production of a satisfactory chassis, and it is a field in which his ability can be used to greatest advantage. A good motor, a good transmission and other good parts of the lower half of a car can be produced only through excellent technical knowledge. A salesman very likely would achieve very unsatisfactory results if it were left to him to select the steel which was to be used in a motor or the amount of piston clearance that was to be allowed. That is something the salesman can talk about after it is done but generally would prefer to steer clear of beforehand.

"If the engineer decides that a stroke of 4½ inches is best, it is safe to assume that experimentation has led to that conclusion, and if the motor works satisfactorily the salesman can sell it. But—there are other things besides a chassis which sell a car. The average prospect of to-day, especially the prospect who buys one of the higher-priced cars, looks very much to the appearance of the vehicle and to its comfort, finish and appointments. On these points, it is my belief, the manufacturer should harken to the dealer.

Giving Demonstration to Mrs. Montague.

"Let us imagine a car in which there is a cheap carpet; the engineer may have put every effort into perfecting a chassis, and when it came to the body may have decided that the cheap carpet was good enough. Therefore, it went in. But now let us follow the car after it gets into the hands of the dealer.

"The dealer goes out to give Mrs. Montague a demonstration. Mrs. Montague has spent an hour or two in the hands of her maid. She has dressed from the skin out in the finest apparel, her hair has been coiffured in the latest mode and every detail of her outfit is perfect. She moves tow the door of her luxurious apartment, ric carpeted and where everything is in best taste and harmony. Outside the d is a uniformed hall attendant at attenti she enters a mirrored elevator run by a u formed operator. The street door is ope by another uniformed man, and she wa to the car over an expensive carpet. H shoe never even touches the sidewalk.

"She steps into the car, and the first th she notices is that cheap piece of carp Maybe the edge of the upholstery is tac instead of stitched; she hasn't a piece furniture in her house with such a fin as that. The upholstery may not be o very high quality. Perhaps the looks of t car do not appeal to her. Numerous lit things like that may be all out of acc with the things which are a part of t life she leads. The motor may purr ever silently, the car may glide ever so smooth the accessory equipment may be comple but she doesn't care for it at all.

Mechanical Man Can't Understand It.

"The dealer tells the general manager the factory that the car doesn't suit the cla of trade for which it was built. The ge eral manager takes the message to the e gineer. The engineer says, 'Hm-m-m-m That's funny! I can't understand it. I ha spent years in developing that car to i present perfection. I regard it as the mo nearly perfect car that ever went out this factory. I can't understand it.' An the engineer is right, so far as he goes. is the most nearly perfect car that ev went out of the factory—from an enginee ing standpoint, but not from the dealer standpoint.

"And why? Let us go home at night wit the engineer, and we find his home void the artistic atmosphere apparent to th eye in Mrs. Montague's apartment. W do find, however, a library of technic books that the engineer would not exchang for the most beautiful Fifth avenue hom His home is comfortable and serviceabl His environments, however, are such that i his text books and experimental shop he i agreeable to invest large amounts c money; this is to satisfy his desire to in crease his knowledge of his subject, rathe than to spend needless sums of money i

Digitized by Google

bric-a-brac and chairs of beauty without comfort.

"The man of the house may go down stairs after supper to take care of the furnace. His hands get a little dirty, but what does he care? He is a man who is accustomed to oil and grease and dirt. It's honest dirt, true; but Mrs. Montague wouldn't shake down a furnace if she froze to death. After supper the engineer may work in his private laboratory or study in his books. He may pore over a difficult factory problem at the same time that Mrs. Montague is playing bridge.

Different Lives Cause the Failing.

"Understand me, I am not holding this man up for ridicule, rather for admiration; I am not criticizing his method of living or his home; I am not holding him low in my esteem, but am merely showing the difference between him and Mrs. Montague. If one had the money and the desire he could easily become a Mrs. Montague, but desire and all the money in the world do not make an engineer. This man is a leader in his field; he is efficient as an engineer; he can turn out a piece of mechanical work that is unsurpassed, but he can't pick out a carpet for Mrs. Montague.

"And why? This man has lived in a world of a different sort. Mrs. Montague has spent years, perhaps, in her environment and is perfect in the requirements of correct living, as she understands it. An off shade in a carpet would condemn it in her eyes, and if it were not the best in its class, or something very good, she would have no use for it.

Dealer Knows What Prospect Wants.

"Now, then, how can the engineer know what Mrs. Montague wants? He can find out from the man who knows, and the man who knows is the dealer, the salesman, the man who sells the car. The dealer and salesman are in close contact with these prospects; they know what the car buyers want and do not want, wherefore I maintain that their judgment should have great weight in the building of a car, in its finish and appointments. It is not a question of the manufacturer spending more money on the cars but of spending what he does spend so it will mean its greatest value and bring the greatest return.

"Were I the general manager, and the Chicago dealer objected to the carpet—or maybe I would investigate before a complaint was made—I would ask the dealers in New York, Boston, Philadelphia and San Francisco whether they thought that carpet satisfactory. If the dealers in New York, Boston and San Francisco said they had no fault to find with it, but if the Philadelphia dealer said he didn't think it just the right thing, the manager then could present the views of the objecting dealers to those who said they were satisfied and see if they still preferred the carpet used or had merely overlooked its low quality. If the other dealers then said they were inclined to agree with the objecting dealers it would seem advisable to make the change.

"I've been talking all the time about a piece of carpet, but the piece of carpet is only an illustration. Almost any other thing might be taken as an example. The idea I have tried to express is that while the mechanical men of a factory are efficient in mechanical work and should have undisputed sway there, they are not so capable when it comes to fitting up a car which is to be sold to the class of buyers for which it was intended.

Composite Picture the Proper Car.

"This applies most aptly to cars of the higher prices, but, in a measure, it fits cars of lower price. Perhaps a manufacturer is turning out a car for $1,500 and the engineers have put in one or two things to which the selling department takes exception. Maybe to change them would make no appreciable difference in the cost. In that case the acceptance of the advice of the dealer would be a wise move on the part of the manufacturer. In any car, my belief is that when it comes to looks, finish and appointments the dealers should be consulted.

"From all of the dealers which a company has, the general manager could glean information as to what they believe is the best form in which to present the car to the public. From this information the general manager could form a composite picture of the car which would best suit the majority, and that is the car the factory should build."

Loses Ring Inside Tire He Repaired.

If this were fiction many readers would say it might be true; when presented as a fact the same readers may say it sounds like fiction, but E. L. Campbell, of Mountain View, Okla., vouches for the veracity of the story and it is entirely plausible.

Last January J. W. Bradbury, of that town, borrowed Campbell's automobile, but before he got off the main street had a blowout. He repaired the damage, but on reaching home discovered that he had lost a valuable ring from his finger. He immediately concluded he had lost it while repairing the tire and hired several small boys to shovel the snow away from the spot, but the ring failed to appear. When the snow melted a further search was made, but the ring could not be found.

A few days ago the tire blew out again, but this time Campbell was driving it. In repairing the tire Campbell felt something hard between the tube and the shoe—it was Bradbury's ring, just as good as it ever had been.

Diesel Engine Inventor Lost at Sea.

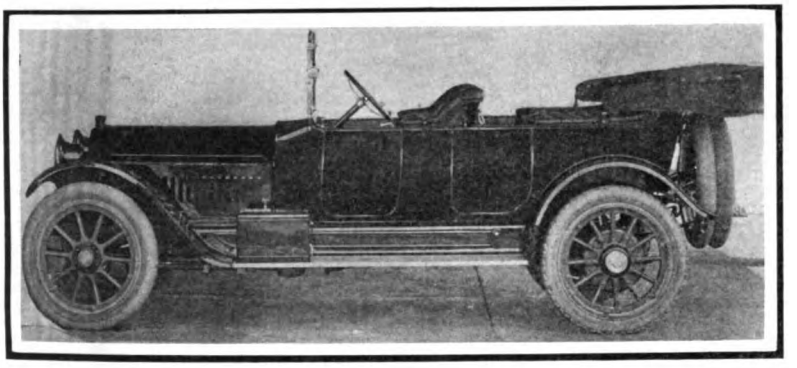
Dr. Rudolf Diesel, well known throughout the civilized world as the inventor of the internal combustion engine that bears his name, apparently was lost at sea during the night of September 29th, from a steamer plying between Antwerp and Harwich. Dr. Diesel, together with several eminent Diesel engineers, left his home in Munich, Germany, on the 29th ult., to attend the annual meeting of the Consolidated Diesel Engine Manufacturers in London, and at about 10 o'clock that night retired to his cabin on the steamer Dresden. When stewards went to aweken him the following morning he was not in his cabin nor had his berth been occupied. The idea of suicide is scouted by those who knew Dr Diesel, for no motive for such action can be ascribed. It is supposed he fell overboard during a somnambulic trance. Dr. Diesel was born in Paris in 1858, and since his engine first became a commercial possibility 14 years ago, had amassed a fortune estimated at $2,500,000. He had practically retired from active business and lived a secluded life on his Munich estate.

Washington Has Two Ways of Backing Up.

There are two ways of backing up a car in Washington, D. C. One is backing up when you want to go backwards and the other is backing up when you want to go forwards; the latter is illegal, according to an interpretation placed upon a recently adopted traffic ordinance by Police Court Justice Mullowny. The ordinance provides that a chauffeur must not back up his car when turning around, which, of course, is preliminary to going forward.

A chauffeur was arrested for backing his car along the street and was arrested under the backing-up ordinance; the judge held that if the chauffeur had been turning around when he backed up he could be held guilty, but that he could back his car on the streets all day if he so desired without violating the ordinance. Wherefore, it seems logical to assume that if a man is backing up in turning around and sees a "cop" coming, all he has to do is to keep backing up and escape arrest by the explanation that on that particular day he was driving backward.

Smith Hardware to Build a New Plant.



The Jos. N. Smith Co. of Detroit, which manufactures automobile hardware, has purchased a site for a new plant in that city on St. Antoin street between Hendrie and Farmer avenues. It includes approximately half a block and is valued at about $20.000.

TWIN MUFFLERS EMPLOYED IN LATEST MODEL HOWARD "SIX"

Other Design "Wrinkles" Include New Gate Change, Spherical Accelerator Pedal and Unusual Fuel Tank —Specifications in Detail.

As a definite means to the betterment of products, there are not a few automobile manufacturers who adhere resolutely to the one-model policy, secure in the belief that to do one thing continually and to do it thoroughly is to do it well, and the Howard Motor Car Co., of Connersville, Ind., is one of them. Having decided, therefore, that it will produce a six-cylinder model, it follows that every one of them will be identical not only as regards chassis construction but in body construction as well. The single model is a five-passenger touring car that follows fairly closely the generally accepted idea of standard practice and that incorporates a number of chassis "wrinkles" that give evidence of well-thought-out design.

HOWARD "SIX" FIVE-PASSENGER MODEL IN TOURING TRIM

As regards the principal mechanical portion of the chassis, which, of course, is the motor, suffice it to state that it is a Continental; but it is a Continental that incorporates a number of improvements, not the least of which is the adoption of a double system of exhaust ports that is the idea of Chief Engineer J. C. Moore of the Howard company. By way of ensuring positive ignition of full charges of undiluted gas, Moore has worked out an exhaust system in which two manifolds, two flexible exhaust pipes and two separate mufflers are used, the theory being that by having successive cylinders in their order of firing exhausting into alternate mufflers the possibility of exhaust gas diluting the incoming charge of fresh gas is effectually obviated.

The motor itself is a standard Continental with a bore and stroke of 4⅛ inches and 5¼ inches, respectively, and it delivers 60 horsepower on the block at 1,500 revolutions a minute. Lubricating oil is forced to the main bearings by means of a plunger pump operated by an eccentric on the camshaft and cooling is effected by water circulated by a centrifugal pump driven by "silent" chain from the crankshaft. For ignition, two separate systems—a Bosch high tension magneto and an Atwater Kent system—are used and "mixture" is supplied by a model G Stromberg supplied with heated air from a special box on the exhaust manifold.

In the gear-shifting apparatus, which is placed in the center of the footboard and therefore comes at the driver's right hand, the steering gear being at the left side, another clever "wrinkle" is apparent in the form of the quadrant. The usual latch to prevent the driver inadvertently shifting into reverse is missing, and instead it requires premeditation and a distinct movement for the lever to be placed in the reverse position. The slots are curved to facilitate forward shifts, the necessary action therefore evolving into little more than a straight forward or backward movement and the side movement being obtained almost automatically. Three speeds forward and reverse are provided and by way of eliminating useless parts, the lever is mounted directly atop the gear case. Between the engine and the gearset there is a large diameter cone clutch that is fitted with 12 spring inserts beneath the leather face to induce that peculiarly soft action so much esteemed by experienced drivers. An adjustable clutch brake is fitted to facilitate gear shifting.

Skipping the gearset, there are two Spicer universal joints in the propeller shaft between the gear box and the differential mechanism and the torque reaction is taken on a triangular tube anchored in a spring cushion at a front cross frame member. The rear axle is a Timken, which is quite sufficient introduction, and the same may be said for the front axle. That they are substantial and are properly constructed with a view to producing both strength and beauty goes without saying.

Brakes and springs in the Howard "six" have been given particularly careful thought, and this is revealed in the fact that brake drums measure 15½ inches in diameter and 2½ inches across the face; both sets operate on one pair of drums. In the spring suspension, semi-elliptic members 38 inches long are used in front and in the rear three-quarter elliptic members some 52 inches in length are used. Incidentally, all spring eyes are bronze bushed and the bolts are hardened and ground.

Among the less conspicuous little things that have been worked out with an eye to the comfort of the riders and to the appeal of the car to both the dealer and the purchaser is the distinctive tire bracket at the rear. Riveted to the frame, the tire holder is designed to carry either one or two spare tires and is adjustable so that when only one is carried no support for the second is visible nor are any straps used; metal clamps take their place. The design of the accelerator pedal is another little "wrinkle" that is well worth copying. Instead of the usual device, this pedal is spherical so that either the toe, the side of the foot or the instep can be used, thus providing against fatigue in long runs. Still another clever "dodge" is the way the gasolene tank is constructed. It holds 18 gallons of fuel and the bottom is built on a slant so that when the car is tipped almost on end when climbing a grade a good head of fuel to the carburetter is ensured; the tank is beneath the driver's seat. Needless to add, with all the other fitments, a gasolene gauge has not been overlooked.

Equipment, of course, is complete, and includes an electric lighting and engine starting system in which the engine starter drives through a "silent" chain directly to the crankshaft of the engine. The lamp equipment includes head, side and tail lamps and the wiring has been carried through the lamp brackets, thus at once protecting and hiding it. The remainder of the equipment includes a Troy windshield which is built in place; a speedometer, which with lighting, ignition and starting controls is mounted on a cowl board that also hides a liberal tool storage space; Firestone demountable Q. D. rims carrying 36 x 4½ tires; silk mohair top with Jiffy curtains and dust boot; foot and robe rails, and the usual complement of tools, spare parts, etc.

Jiffy Curtain Has Moving Day.

The Jiffy Auto Curtain Co. has removed its headquarters from the Ford building, in Detroit, to the Dodge Power building in the same city. In the latter structure they occupy a large part of the fourth floor.

CHARACTER—BUSINESS BASIS

Quality Which Is as Essential as Money in Building for the Future—The Boy Who Started With $300 and Character—and Won.

Character! What a summing up of potential force in a single word. "He has character"—that is, he stands for something definite and positive. It is a way every one of us would like to have others think and speak of us.

Ten years ago a thin, raw-boned lad came to Detroit from a small Canadian farm. He left home because he did not like farming. His business at home had been doing every sort of chore that no one else wanted to do. He did a man's work and did not draw even a boy's pay. There was absolutely no reason why he should like to stay at home.

Started Career at $3.50 a Week.

Detroit was about 100 miles away. How he got there makes no difference. Two days after his arrival he had signed an apprenticeship contract with a brass finisher and proceeded to learn the business at $3.50 a week. He was 21 years of age and a hard worker.

In six months he drew $8 a week and saved half of it. A year went by and he still got $8 every Saturday. It was not enough. He went to his employer and told him so; the employer said it was the best he could do, though records plainly showed that the young Canadian was turning out 50 per cent. more work than his companions who drew more pay. He quit the job. Then he found work at the Olds Motor Works. He learned the parts that went into a car. They moved to Lansing and he found himself without a job. He had maintained his custom of saving half his salary and loss of work did not worry him.

He had $300 in hard cash at the end of three years, besides what he would need to live on for a few weeks.

Accident had brought him in contact with a practical pattern maker. They had often talked about the opportunities for establishing a business. He was shrewd and level headed. He engaged the pattern maker to work for him at a fair salary and then rented a small place where the work could be done.

Frankness and Honesty Made Friends.

He got business right away. His frankness and his honesty made friends. He was fair to his customers and he was strict and hard with himself. He worked from six in the morning till eight and nine at night. He kept the books and collected the accounts and took care of the office and worked in the shop—and was always the first one down in the morning. He literally swept up the chips and saved pieces of wood that other shops threw away as worthless. It meant profits for him if it could be used—and it was used.

His shop grew and new employes were added from time to time. The spirit of thrift and economy did not prevent him from paying employes who were worth it, as much as, and in many cases more than, they could earn elsewhere.

His $300 Has Grown to $50,000 Business.

From that original $300 in seven years he has developed a business easily worth $50,000. He has houses and real estate. He has a wife and family. He has a model plant. He has contented workmen. He has loyal business friends. He has credit at the bank that has never been strained or abused. He has always paid cash; he has never used notes.

What is his secret? He has seen opportunities where other men saw only waste. He has devoted himself to his business. He has developed with it. Was it thrift? Was it energy? Was it luck? Yes, much of it was thrift, much of it energy, some of it the luck that follows close upon those qualities—but most of it was character.

BOOMERANGISH EFFECTS OF SUBSTITUTING "JUST-AS-GOODS"

The extra time, energy and effort put forth by many dealers to sell an inferior substitute for a standard article in order to obtain a few cents more profit is amazing, and, in many cases, ultimately destructive.

Consider for a moment the matter of dry cell batteries. A customer who had used "C" batteries and secured excellent results from them orders a set of six from his dealer. The dealer wires up six cells of another make which we shall designate "N." The customer notices this and the dealer comes back with a long argument in favor of the "N" cell, which he really knows cannot possibly give as satisfactory results.

The customer pays for the battery which in due time runs down perhaps from 30 to 60 days sooner than the "C" battery. What does the customer do? Go back to the dealer for a fresh supply of "N" cells? Not by a jug full. He goes straight to a hardware store or an electrical supply house and gets what he first wanted. The dealer by his greed drives away a customer whose purchases of other goods would more than compensate for any loss of profit on the item under consideration. He has lost the confidence of the motorist and helped to kill the goose that laid the golden egg. Do you get it?

Benefits of Printed Price Lists.

The practice of listing prices on supplies in plain, readable figures and posting the list in a conspicuous place in the garage is a good one. Dealers who sell Prest-O-Lite tanks, oils, gasolene, etc., find that the printed prices not only eliminate arguments but create confidence in the minds of purchasers. It is the old story of the one-price system that is a good thing in any business.

AWAKE-N DISING WORLD

"THINKING" WAY TO SUCCESS

Time Set Apart for Thought Most Precious Part of Day—Sales Manager Who Is Wonder at His Work But Who Has His "Quiet Hour."

To be a successful sales manager is to fill a big job. It means hiring and firing salesmen. It means watching the whole firing line for results. It means watching expense accounts, watching territory, watching dealers, watching correspondence; it entails keeping an eye on production and on the markets; and it often includes general supervision over advertising of all kinds. And then you have only begun to list some of the things the energetic, live, buoyant sales manager must keep on his mind—must be responsible for.

In a general sense the duties are the same, whether it is for a factory or for a branch or for a distributer.

Manager Must Have Ability to Plan.

Needless to say, most sales managers are up to their necks in work all the time. It takes sales to "make the wheels go 'round."

The characteristic that marks the successful sales manager is his ability to plan. That means he must have time to think. When can he find time to do it?

A most aggressive sales manager for a concern that is conspicuously prosperous has an assistant whose duties are those of a corresponding secretary. The mail is distributed each morning as it comes in. Notes are made of the things the salesman wishes to follow up. Letters that seem to require his personal suggestions or ideas are held on his desk. The balance are turned over at once to the correspondent. Just as soon as he is ready the sales manager presses the button for the correspondent. Together they go over the letters and frame replies, which the correspondent dictates and to which he affixes the company's signature. The letters are then left on the sales manager's desk for him to look over.

From 3.30 in the afternoon till 4 o'clock he invariably follows up the different memoranda made while looking over the morning's correspondence, dropping in the shipping department to let them know by a few judicious inquiries that he is keeping close tab on them. From 4 till 5 he can be usually found at his desk with a pencil and pad. He seems to be looking out of the window. In reality he is doing some hard thinking.

Sets Aside Last Hour of Day to Think.

Each day this hour is resolutely set aside for that purpose and nothing is allowed to interfere. It is then that plans are made and decisions arrived at. At 5 o'clock the pencil and paper go into a locked drawer, from whence they emerge the next morning as soon as the mail is distributed.

One of his associates wonders how he can think of so many different ways of doing things; another wonders how he keeps track of so many different matters that are right at his finger tips; another wonders why he seems to have so little to do when he knows so much is being done. Ask the sales manager himself, and he smiles and says, "It's my quiet hour—that's all; it gives me time to think."

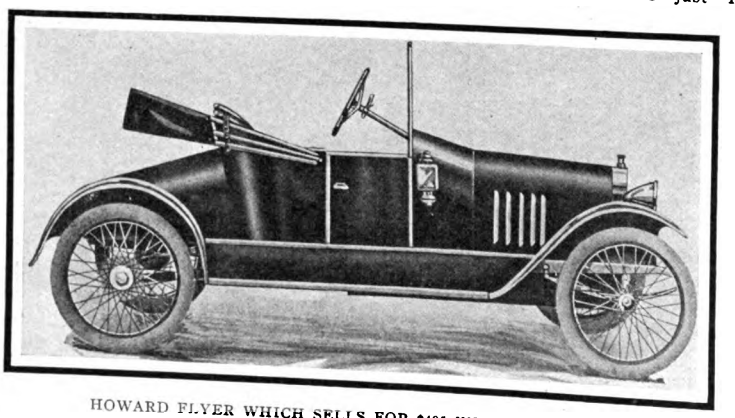
GASOLENE PUMP AS EXAMPLE OF PROFITABLE CONVENIENCE

"We grow so accustomed to the shortcomings of our ways of doing business that we are blind to them, I suppose." remarked a dealer who had stolen a two weeks' vacation in the midst of the busy season and spent it partly in the woods and partly in the large cities, where he had a good chance to observe the methods of other concerns in the same line. "My customers have always driven straight into the garage for gasolene; my pump was away at the back, and as far as I was concerned the arrangement was satisfactory enough. But when I began driving my car around another large ci where for once I was the customer I n ticed that I appreciated the saving of eve minute in getting supplies. A street tai that was situated at the curb made a h with me, as it apparently did with mai others.

"When I got back home I wrote for catalog. The salesman followed and got n order for the tank without argument. has been in operation for three weeks ai my gasolene sales have tripled. I am d ing business with people who apparent never even looked at my garage before, ai I am confident of a still further increas as people get accustomed to the conve ience of my service."

An idea picked up here and there ai adopted can often be turned into a b money-maker. Keep your eyes and yo ears open. What you don't see you m read about. But unless you adopt the id and make it yours it will not do you ai good.

EVEN THE VOICE AT THE 'PHONE MAY INDUCE ORDEI



An accessory dealer who sells a comple line of motorists' supplies found that h telephone business increased material with a change of operators. Acting on t advice of a business friend whose couns he valued highly, an intelligent, bright g with a pleasing voice was engaged at $15 week—just seven more than he had be paying. The girl was informed that s was the point of contact between telepho customers and the house and was just much in the sales department as anyboc Catalogs and booklets were given her read and prices and other details explain to her thoroughly, with the result that aft two or three months she could reply to t average inquiry instantly. Besides savi much of the time of other employes, s has more than earned the difference in s ary by business booked over the 'phone.

HERE'S THE HOWARD FLYER; SELLS FOR $495, EQUIPPED

First of Batch of 5,000 Has Four-Cylinder Unit Power Plant and Two-Speed Gearset—Roadster Body on Standard Tread.

Adding one more to the very short list of manufacturers who have essayed the production of a car to sell for less than $500, the Howard, or rather the Flyer, as it is styled by its makers, the Thomas Howarod Co., of 319 Atlantic avenue, Brooklyn, N. Y., at length has reached the stage where it is practically ready for the market. Brief advance specifications of the car were published in Motor World under date of August 28th, when announcement of the plans of the Howard company to produce it in a Detroit factory was made; the tentative selling price, which had been set at $450, has been raised to $495, though the specifications remain practically the same.

HOWARD FLYER WHICH SELLS FOR $495 WITH EQUIPMENT

In exterior appearance, the Flyer suggests no other car in any particular detail, as may be judged by the accompanying illustration, and a studious attempt has been made to eliminate anything that might be judged outre, to use an expressive French word. The car is small, it is true, but that it is in no sense a cyclecar, or what has generally come to be termed a cyclecar, is revealed by the fact that its tread is standard and that its transmission elements include such evidences of real automobile construction as a two-speed selectively controlled gearset and shaft drive terminating in a substantial differential contained in the rear axle housing.

Furthermore, the car has a full-sized roadster body deeply upholstered and equipped with all the little appointments that help to make the driver and his "right hand" man—or woman—happy. Which is to say, it has a top and a one-piece built-in windshield that can't rattle, and liberal storage space for the stowing of tools and things that are not tools. The whole after deck, in fact, is a great, commodious storage space, the gasolene tank, which holds some 10 gallons of fuel, being located under the seat.

Right hand man—or woman, as the case may be—is used advisedly, for, in conformity to popular demand, the steering column has been placed at the left side. It follows, quite as a matter of course, that the control levers have been placed in the center of the footboard so as to leave both doors free and unencumbered. One of the levers is for the gearset, no need to explain, and the other operates the emergency brakes, which are mounted on rear wheel drums; the wheels, by the way, have wire spokes and measure 28 inches in diameter; they are shod with three-inch tires and the distance between the axles is just 100 inches. Of the two pedals, one controls the clutch, a three-inch face, 11-inch cone that is contained within the flywheel and is quite hidden owing to the fact that it is within the housing that holds the gearset and is bolted to the engine, and the other operates the service brake, which is a band contracting on a nine-inch drum on the transmission shaft.

Under the hood, which has been carefully blended into the lines of the deep skutttle so as not to offend the susceptibilities of the esthetic, there is a four-cylinder four-cycle unit power plant with cylinders measuring 2¾ inches in bore by 4½ inches in stroke. Further delving into the intricacies of engineering data brings to light that the crankcase is of the barrel type; the crankshaft has three substantial bearings; the oiling system operates on the vacuum principle; cooling water is circulated through the jackets and the radiator by means of a substantial pump; ignition is effected by high-tension magneto; and that a 12-inch ball-bearing-mounted fan induces a draft through the radiator.

By way of ironing out the irregularities in the highways, reliance is placed primarily upon semi-elliptic front springs and full-elliptic rear springs, though there is no reason to doubt that the deep upholstery also does its part in protecting the spinal columns of those who ride in the car. Above the springs there is a pressed steel standard channel frame with a horn front and four substantial cross members to discourage weaving; the frame is 30 inches wide.

Equipment includes, as well as the top and the windshield, two acetylene head lamps fed by a generator, two oil side lamps and an oil tail lamp. It is planned to produce 5,000 cars in the first series.

Care Needed in Adjusting Wheel Bearings.

In adjusting any form of cup and cone ball bearing, especially those that are used in wheels, for instance, there is grave danger that too much pressure may be put upon the balls and that the life of the bearing will be shortened in consequence. It should be remembered that bearings that are tight when the weight of the car is off them, will be still tighter when they carry their load. A safe proceeding is to tighten the bearing until all "shake" or looseness is eliminated, yet the wheel is free to spin easily several revolutions under not too violent persuasion. It is a mistake to adjust bearings too loosely just as it is a mistake to adjust them too tightly.

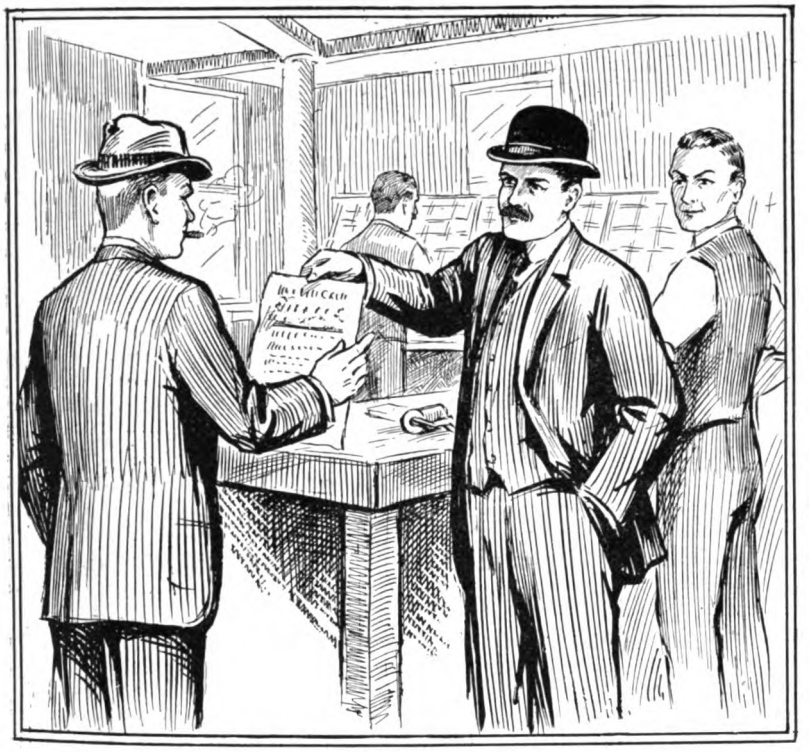
Simple Cure for Windshield Rattles.

One way to cure the rattles that sometimes are caused by the loosening of windshield glasses in their binding is to calk the cracks with brown paper mashed to a pulp with water. After the calking has dried, it should be varnished, and the job generally can be relied upon to last almost indefinitely. The varnish will make the joint weather-proof.

Sediment That Stops Circulation.

Water circulation occasionally is interfered with by foreign matter collecting in hose connections from the bottom of the radiator to the pump; the pocket in the line formed by the hose offers an opportunity for deposits, and if there is any indication of trouble in this direction the bottom hose connection should promptly undergo a cleaning.

Simple Rule for Tire Inflation.



In case of doubt as to the proper pressure for tires, a safe rule is said to be to multiply the diameter of the front tires by 17 or 18 and the rear tires by 20, the resulting figures being the proper pressures. For instance, if the car has 3½-inch tires, 3½ x 18 gives 63 pounds for the front tires and 3½ x 20 gives 70 pounds for the rear tires.

SOMETHING WORSE THAN TRADE'S WORST LAPSI

Not Meeting Promptly Visitor to Salesroom Surpassed in Enormity b Running Away After He Enters—Reilly and Sales Manager Inspect Company's Initial Attempt at Dealers' Uplift

"Have you got a proof of the first page of the Dealers' Bulletin?" asked the Sales Manager, who, with Reilly in tow, had passed from the factory proper into the little corner of the top floor which housed the diminutive print shop where much of the company's circularizing literature was printed.

THE SALES MANAGER, HANDLING IT GINGERLY, PASSED IT ON TO REILLY

"I'll get you one," replied the foreman, as he reached for the ink roller, ran it over one corner of a form, carefully spread a sheet of paper and proceeded to thump a vigorous and methodical tune with his block and mallet.

Inspecting Company's First "Shot."

The foreman handed the proof to the Sales Manager, who, handling it as gingerly as had the printer, passed it on to Reilly; Reilly reached for it and, of course, managed to stick his thumb in the wet ink, thereby transferring to that digit about 16 ems of the company's initial installment of its dealers' uplift campaign. When Reilly looked at his decorated thumb he saw backwards a part of an admonition to the dealers to take every advantage of the opportunity which lies in meeting with promptness and courtesy the visitor to the salesroom.

"Good!" commented Reilly, "Fine!" as he read the message in its neat and attractive typographical form, showing the dealer how by a mere lapse in the conduct of his business he might have been putting crepe on the door at which opportunity had intended to ring the bell.

"Good stuff!" he exclaimed, as he handed the proof back to the Sales Manager and attempted to wipe his thumb on the edge of an imposing stone. "How long are you going to hammer on that theme? How long do you think it will take for it to sink in and do some good. How many numbers is it going to run through?"

"That's hard to tell. Half a dozen times, anyway, probably," replied the Sales Manager.

"It's a good scheme, as I see it."

"I want to thank you for giving us th idea last week."

"Aw, forget it! I'm so full of ideas I unhealthy," expostulated the dealer, as moved with the Sales Manager over where the "devil" was trying to feed a lit job press so the "boss" wouldn't say t work looked as if the "kid" had fed it wi his feet. He was so busy he couldn't wh tle.

Hitching Codicil on the Sales Idea.

When the lad seemed embarrassed at h ing made an exhibit and miscued twice succession, the two visitors left for t many-stepped trip downstairs.

"You might hitch a kind of codicil or that idea along toward the finish," su gested Reilly.

"What do you mean? Codicil?"

"Just a sort of supplementary idea, extreme or something-worse kind of su ject——"

"Well, what is it?" demanded the Sa Manager. "Last week you said there was anything worse."

"I've reconsidered the matter and ha decided that there is something worse," joined the dealer. "This fault or lapse dealers which you are trying to corre where it exists, is that of not meeting sal room visitors as soon as they come into t salesroom and letting them roam arou unattended and feel embarrassed. Isn't i

"Yes."

Something Worse than Something Bad

"Well, what is worse, in my estimati is not the failing to meet a man but the ru ning away from him when he comes in t door."

"Who ever heard of such tactics those?" challenged the Sales Manager.

"I did—and you're going to. Of cour it isn't so prevalent as the other piece mismanagement, but where it does oc it is infinitely many times worse. I kn your first thought is that it is so nc sensical that its occurrence is practica impossible, but wait until I have explair what I mean. When the thing is inve gated in all its phases you will discover

Digitized by Google

believe, that the habit exists even if it doesn't appear so glaring as it sounds."

"For instance."

"Well, here's one instance—and one of the most pointed I can bring to mind. When I was on a tour last summer down through the southern part of the State I put the car up one night at a garage near the little hotel in Benford. The next morning I went over to get the car and walked into the office where the proprietor was sitting at a desk. I could see him through the window of the office door, but before I got the door open he had gotten up and was on his way out. I was going to say something to him, but he gave me a look over his shoulder and kept right on going. He never even spoke to me."

"What did you do?"

Found Mechanic to Get Out His Car.

"What could I do? I went out on the garage floor and found a man who got my car out for me and I started on my way. I suppose I transacted what business I had just as well with the floor man as I could have with the proprietor; I don't even remember what I wanted to see him about. In fact, about the only thing I remember is that I didn't see him. But I'll take that back ; I did see him—and that's all."

"Maybe he was busy," suggested the Sales Manager.

"Busy!" exclaimed Reilly. "Maybe he was, but couldn't he have stopped long enough to have told me he was busy? It wouldn't have taken him ten seconds to have told me he was busy and had to leave at once and have called someone to take care of me, but he apparently never thought of such a thing. His idea of the way to handle the situation was to walk out on me and leave me to find someone to give me what I wanted. This garageman is also an automobile dealer and, take it from me, he'd work a long time before he sold a car to me after an affront like that!"

"Doesn't handle our line, does he?"

Insulting Conduct in Store and Office.

"No," replied Reilly; "if he had I would have told him what I thought of him, exercising my buttinsky license. It happens in almost any business, Jim, even if you may be inclined to doubt it. Some people may be so accustomed to it that they never notice it, while with others it makes a deep and rankling impression. Did you ever enter an office, have a man look at you from his desk and then go on working as if he had never seen you, or did you ever go into a store to buy something—generally a small store where the proprietor acts as one of the clerks—and have the man start to walk away just as you went in? Maybe he started toward the back of the building to answer a telephone or stack up a stock of goods that had been thrown down for some other customer, but anyway, he walks away from you just at the moment you naturally expect he would walk toward you."

"I can recollect a few such instances, now that you put it that way."

"And they're darned insulting, too, Jim. There is no excuse for it, and so far as I can guess it for myself it is nothing but a queer streak in the businessman's make-up and a streak that ought to be rubbed out. They seem utterly unable to appreciate the fact that the public is their market and that best results are to be obtained only by a diligent cultivating of this field of profits."

"But do you think, Reilly, that this is so much the fault of employers as of employes?" asked the Sales Manager, as they ended a long and leisurely trip down through the several floors of the factory and into the Sales Manager's office.

Often More the Fault of the Employe.

"You're right on that point, I believe, Jim; you'll find many more employes that way than you will employers, and it is a thing for the dealer in cars or accessories to watch out for. Once he finds that an employe is either indolent, inattentive or so impressed with his superiority to the public that he likes to make the customer await the salesman's convenience, it is time to get a new salesman. Rather, he should get 'a' salesman, for the other one isn't a salesman; he's as bad as a smallpox sign on the door, so far as the continued interest of trade is concerned.

"Salesmen of this type, when they see a man come in, will deliberately look at him, letting the customer know his entry has been noticed, and then will proceed to busy themselves with some little thing before attending to the customer. I can't imagine many things which are of so much importance that they warrant a salesman in neglecting to go toward instead of away from a customer."

"He might be busy," suggested the Sales Manager again.

Value of a Moment of Attention.

"That's true," agreed Reilly. "He might be, but even then there is always a way out. If, when the customer comes in the salesroom door, the telephone rings the salesman could at least pleasantly excuse himself and request the customer to wait half a minute until he answered the call and the majority of customers would be glad to do it and never realize that they were being made to wait. You can do a great many things, Jim, but what counts is the way you do them. A little attention of that sort is like an investment in patent medicines; it is infinitesimal compared with the dividends. It——"

"H-e-l-l-o-o! Reilly! I haven't seen you in a long time. Where have you been keeping yourself?"

Reilly grasped the hand which was thrust forward by a big man who had opened the office door, although Reilly looked several seconds before he recognized its owner. Dirty and grimy he was, to be sure, and his overalls and jumper were not exactly in harmony with office furnishings—but it was the Old Man himself.

U. S. Motor's Landlord Seeks its Rent.

The Columbus Circle Realty Co., which owns or has the leasing of the premises at 3-7 West 61st street, formerly occupied by the United States Motor Co., insists that someone should pay the rent for the first three months of the present year. It appealed this week to Judge Hough in the United States District Court for the Southern District of New York, where the big corporation was put through its receivership, asking that the receivers or the Maxwell Motor Co., as assignee of the purchaser of the assets, pay this rent. Judge Hough held that the receivers were liable for 11 days' rent, and that he had no jurisdiction to compel the Maxwell company to settle if it were the legal debtor for the balance.

Beaver State Motor Locates in Oregon.

The Beaver State Motor Co., of which P. A. Combs is president, has secured a factory site in Gresham, a little town 12 miles east of Portland, Ore., Portland capital having been invested in the enterprise. It was originally the intention of the Beaver State company to locate in Milwaukee, Wis., where it was organized, but differences arose which caused it to go west.

Van Blerck Secures Site in Monroe.

The Van Blerck Motor Co., which manufactures automobile and marine engines in Detroit, has secured a site in Monroe, Mich., on which a one-story brick factory, 177 x 600 feet, immediately will be erected. When it is completed, the Van Blerck company will remove from Detroit.

Wants its Pay for a Sidewalk Pump.

Claiming that no payment ever was made on a sidewalk pump which it installed for the Federation Supply Co., of Utica, N. Y., the Wayne Oil Tank & Pump Co., of Fort Wayne, Ind., this week filed suit in the Supreme Court for New York county; it demands $260.

The Woods Motor Vehicle Co., of Chicago, has established a branch in Peoria, Ill. It will be in charge of W. E. Johnston.

NORTHWESTERN DEALER'S ESTABLISHMENT THAT RANKS AS PALATIAL MODEL OF ITS KIN

Spacious Salesroom, 32 Feet High, a Third-Birthday Present to Minneapolis Company — Attractive and Possesses Up-to-Date Equipment.

What is said to be one of the most palatial and best equipped dealer's establishments in the Northwest was opened two weeks ago by the Frederick E. Murphy Automobile Co., of Minneapolis, at 13th street and Hennepin avenue, a location in the heart of Automobile Row. It has a frontage of 137 feet, is 144 feet deep and is of three stories, with a front of cream-white glazed brick and terra cotta.

The showroom is one of the features of the structure; it is 32 feet high, 81 x 76 feet in floor space, is finished in cream and buff and the white-tiled floor is outlined in a delicate blue. Spacious plate glass windows on two sides from floor to ceiling afford ample light during the day and at night illumination is effected by six shower chandeliers, of 17 lamps each, and numerous other smaller lights throughout the room. A mezzanine floor on the street side, where cars are displayed, has lin-o-lights.

Accessory and stock departments are at the rear, as is the repair-shop, 54 x 144 feet. The remainder of the building includes offices, elevators, a 10,000-pound electric elevator for cars, with a speed of 120 feet a minute, shower baths for the employes and women's rest room. The building cost $165,000 and was taken possession of on the third anniversary of the company in the business. The concern handles Lozier, Mitchell and Paige cars and Commerce trucks. There are 88,000 feet of floor space.

"My Best Sale and Why I Regard It as My Best"

Keeping Car Sold After Dilatory Actions, Due to Special Order, Had Helped "Unsell" Car—Offsetting Two Weeks' Promise That Developed Into Six Weeks' Fulfilment—Fair Treatment as to Deposit and How it Helped.

By W. R. ALEXANDER, Indianapolis, Indiana.

SALESMAN WHO WON OUT WHILE HIS CO-WORKERS DODGED MAN WITH LEGITIMATE COMPLAINT

One of the other boys had sold him—we had his order and a $250 deposit. I suppose you wonder how I figure I had any just cause to be proud of the sale. So far, I didn't.

It was a special order all the way through—special whipcord upholstery, special painting, including trim sticks and instrument board. The special features went down to fine points like binding on the cushions. Believe me when I say the company didn't thank the salesman for that order, for it came in the middle of the busy season. However, the order was accepted and started through. Delivery had been promised in two weeks.

Promise Dragged to Triple the Time.

You all know how a fellow just drops in to see "how his car is coming along." Well, we began to see more of our new customer in about ten days. We assured him it would be along shortly. Two weeks went by—three—four—five—six, and ten times as many promises to the buyer. Say! we used to leave the office by the back door and go down side streets to avoid meeting him. As time wore on, he wouldn't have anything to do with the young man who had taken his order, and then he "wished himself on me." I had no arguments in my favor. I could only admit he had a "kick coming" and agree with him in everything he said, as I have found that is sometimes the best "first aid to the injured" and then await developments.

He had figured on a tour in his new car—some 1,500 miles. It would have been the sixth week after he placed his order, and as the special parts were beginning to arrive then he put the trip off for a week. He was going to start Saturday, but it being a special car, some things weren't right. More delay! You can imagine the buyer's disappointment and disgust by the first of the following week.

I didn't see him for a couple of days; I knew something was happening, but I couldn't get a line on him. The car was finished—final tested and ready to deliver—but no man.

The next morning he was down bright and early. I was able to meet him with the first "real" smile I had ever given him, for I knew this was the end—the car was ready. He didn't return my smile, but I had gotten used to that several weeks before, so didn't think anything especially wrong; but when he said he had bought another car and was leaving that afternoon I knew it was time to get busy.

Effort Required to Keep Car Sold.

I have sold lots of cars—easy sales and hard ones; but here was a new situation—to keep a car sold. It was a special car on our hands; I simply had to move it; that was all there was to it. Of course, we had a small deposit, but it was not our policy to hold it in a case like this. I had to sell him all over again, and, believe me, he was far from a good prospect—and with a brand new car.

He said he wouldn't take but a minute of my time; he only wanted to know what we intended to do with his deposit; he expected to forfeit it. I had had a good many weeks to size up this man, and now I was going to see if I was a good judge of character, although a good deal was at stake. There was only one way to do it, and that was to get on his side of the fence with him. I assured him we realized his disappointment caused by the delay—his embarrassment in having to postpone his trip, and that while we were sorry to lose him as a H—— owner, we valued his good wishes toward us above everything else and would gladly return his deposit in full. It was the unexpected for him, and I could see it had gone home when he said he would like to see the car if it was finished.

Resale Costs Prospect $100 Deposit.

The car was a beauty; there was no question about that, but I didn't comment on it, as I knew he could appreciate it and I felt that this was one time when it was best not to talk. He didn't say a word, but walked all around it and finally got in it. I was selling him by letting him sell himself. When he put his hands up on the wheel and exclaimed "She's a bird!" I knew it was all over.

We ran the car out that afternoon and, as he was smiling and telling me goodby on the start of his trip he told me he really hadn't bought the other car but did have a $100 deposit on it, which he was willing to lose.

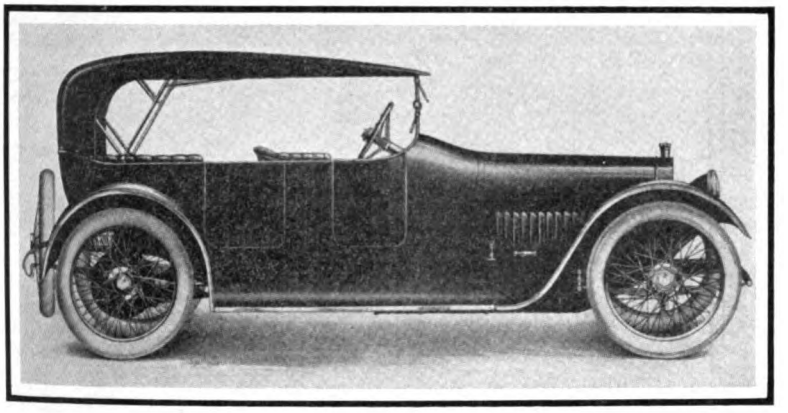
I claim that was my sale—my best one.

"Check Casher" Working in Chicago.

Money is said to be free in the West, and it evidently is upon this basis that a young man of uncertain name and residence has been seeking a workless livelihood along Chicago's "Automobile Row." He has not thus far cashed in very heavily, but has a good and plausible scheme. He has made several attempts, the last of which was at the salesrooms of dealers Rowe, Young & Cooley.

He played the part of a prospect to perfection, and after the proper amount of talk on the part of a salesman, decided that the Westcott was the car for him. He offered his check in payment and said he would call later for the car; this was perfectly satisfactory, as it would permit an examination of the paper. But—he also asked that the company cash an additional check of $25, as he needed the money the same afternoon and did not wish to go to the bank after it. That part of his scheme failed to work, for which the dealers were very glad when they later learned that his check for the car was worthless.

Chicago to Have "Cowcatchers" on Trucks.



Following the lead of Detroit, Chicago has passed an ordinance which seeks to compel all commercial vehicles to be fitted with fenders "as in the case of street cars," such fenders to be approved by the inspectors of public vehicles. Truck owners are given 90 days to equip their machines with cowcatchers, but no information is given as to the kind of device that will be approved. The issuance of a similar order in Detroit brought to light several devices for such use.

STRIKING BODY OUTLINES IN PULLMAN "LIGHT SIX"

Special Top and Windshield Harmonize with Long, Straight Lines—Vulcan Electric Gear Shifter One of its Big Features.

In the general description of the latest series of cars manufactured by the Pullman Motor Car Co., of York, Pa., published in the August 28 issue of Motor World, the leading features of the light "six," model 6-46, which is the most recent addition to the Pullman family, were brought out and sufficient data given to convey a good idea of the quality and characteristics of the machine, in which modern ideas are incorporated to an extent that is indicatetd by the fact that control of the gearset is effected through the medium of a Vulcan electrtic gearshifter, a set of buttons on the steering wheel being substituted for the usual lever, and starting and lighting are performed by a Westinghouse dual unit system. That the appearance of the car in no wise lags behind the mechanical design is plain from the accompanying illustration.

PULLMAN "LIGHT SIX" MODEL SHOWING STREAMLINE BODY

The flush surface and stream-line effects are carried out in a body that is decidedly distinctive in appearance; the long, tapering hood merges almost imperceptibly into the forward part of the sides and the deep cowl under which is carried the gasolene tank. There is an absence of side lamps or other projections to break the clean sweep of the surface and the straight top line is interrupted only slightly in its run from the radiator to the rear seat-back; the close-fitting crowned mud-guards and last, but not least, the wire wheels, help to produce an ensemble effect that attracts instant attention. Even the top is specially designed to harmonize with the machine, having a rounded rear end and being supported only at the rear end and at the windshield. Complete enclosure is effected by means of Collins curtains. The wheelbase of 130 inches lends itself well to the production of the appearance desired by the designers.

The long-stroke motor—4¾ x 5½ inches—is lubricated by a combination of pressure and splash systems, with sight feed on the dashboard, and the charges are fired by a Bosch dual ignition system. The heated water from the cylinder jackets is pumped through and cooled by a cellular radiator constructed of German silver. Drive is through a four-speed gearset, controlled electrically, as already stated, and mounted on imported annular ball bearings. Direct drive is on the third point.

Both front and rear axles are Timkens; the rear hubs of the wheels carry the brake drums, the brakes being internal expanding and external contracting. In front the springs are long, flat, semi-elliptics, with thin, sensitive ends, while the rear springs are three-quarter elliptics, scrolled. The rear springs are extraordinarily long, being no less than five feet from eye to eye; the front springs are 40 inches long. A rather unusual arrangement consists in underslinging the front springs, while the rear springs are mounted above the rear axle. Left-hand drive is one of the up-to-date features of the machine; the steering gear is of the adjustable worm and sector mechanism, semi-irreversible, with ball thrust, and the hand wheel is 19 inches in diameter and is covered with rubber.

On the wire wheels the tires are 36 x 4, with quick-detachable rims. The equipment includes a power-operated tire pump, the regular and customary set of tools carried in a tool box under the front seat, silk mohair top with Collins curtains, a clear- and rain-vision windshield of special design, a motor-driven electric horn, speedometer, electric starting and lighting system of the Westinghouse make, with the usual electrical instruments, dash and trouble lamps.

EMPHASIZES NECESSITY FOR ACCURACY IN BALL BEARINGS

German Pioneer Maker Lets in Light on Several Subjects in Lecture to S. A. E. Metropolitan Section —His Views on Fitting.

That the little growl that sometimes emanates from ball bearings—that metallic chuckle of metal running over metal—is very nearly proof positive of improper fitting, was one of the points that the members of the Metropolitan Section of the Society of Automobile Engineers had drilled into them very thoroughly on Thursday night last, 25th ult, at the first of the regular monthly meetings, after the summer recess, that was held in the society headquarters in New York. This point, however, was only one of many, equally as interesting and equally as interestingly set forth, that were contained in a paper entitled "A Review of the Inception of the Ball and Roller Bearing and Their Application to the Automobile Industry," that was read before the section by Prof. A. Riebe, of Berlin, Germany, who is paying a visit to America.

Prof. Riebe himself, who is a truly massive Teutonic gentleman with the flowing beard of his countrymen, is generally credited with being one of the pioneers in ball and roller bearing science, having collaborated with Prof. Striebeck in the design and production of the first D. W. F. unit ball bearing. Prior to the appearance of this bearing, when the cup and cone type such as long was used in bicycles and sewing machines was the only one known, Prof. Riebe conceived the idea of the unit bearing and at the instigation of the D. W. F. company consulted Prof. Striebeck, then a professor in a polytechnic university in Germany. The upshot was that shortly afterward the unit D. W. F. bearing became a reality. Subsequently, Prof. Striebeck and Prof. Riebe separatetd, the latter to head a company of his own, styled Reibe Kugellager and Werkzeug Fabric, which produces bearings designed by Prof. Reibe, whose visit to this country is to attempt their introduction.

Although a considerable portion of Prof. Reibe's address was of a highly technical nature, a part of it was of such a character as to be not only interesting and instructive but entertaining as well to those who have no pretensions to a knowledge of the elucidation of the fourth dimension. At times Prof. Riebe struggled in a truly heroic manner with the intricacies of the English language, though he always managed to make himself understood in the end.

Digitized by Google

The burden of the address was, practically, the necessity for absolute accuracy in the manufacture of ball and roller bearings, first; and second, the necessity for proper fitting by those who use such devices. Accuracy, he said, cannot rightly be considered to have been obtained unless absolute interchangeability of bearings is possible. In the construction of bearings, he urged that as shafts invariably are slightly oversize and seldom, if ever, are under size, it constitutes good practice to employ balls that are slightly under size in order to allow for the possibility of the expansion of the inner race due to too tight jamming at the hands of not too scrupulous, or not too learned, shop foremen.

That in some bearings it is possible to so expand the inner race as to make the bearing bind. Prof. Riebe demonstrated by forcing a bearing onto a shaft and thereby effectually eliminating no little side play that normally existed in the bearing. By driving the bearing still further onto the shaft, he demonstratetd that it is possible slightly to distort the outer race and in this way to throw strains on the bearing which it cannot logically be expected to withstand without showing signs of excessive wear.

The result of such fitting becomes apparent in a certain amount of noise—a sort of singing metallic chuckle—that is readily distinguishable and that should be recognizable, he pointed out, as an indication of improper fitting. "Noisy bearings," he summed it up, "are jammed bearings; and jammed bearings wear quickly."

No less care is necessary, he pointed out, in the proper fitting of the outer race, too, and it is here that a great many errors are made because of the general misconception of the definition of the term "piston fit." Trouble is not likely to ensue, he continued, provided a true piston fit is given the outer race in its housing, but, he added, and raised a hearty laugh, "A workman is likely to say, 'Well, if they want a piston fit, let us give them a good piston fit,' and the result is that the fit keeps getting 'better and better' until it no longer can be called a piston fit." It is then, he further pointed out, that the trouble follows—that the bearings virtually grind themselves to pieces for want of the necessary room in which to work propertly.

With regard to dust and dirt in bearings, Prof. Reibe threw a new light on the subject by stating that it is not so much the abrasive action of such material that plays hob with the bearings as it is the room it occupies. Such dust and dirt, he urged, soon was ground so fine that its abrasive action was practically nil, though the fact still remained that the balls, in rolling around their races, were compelled to roll over the finely pulverized dust with the result that their diameter was, in effect, increased, with the net result that the bearing tended to bind.

The best material for ball bearings, he said, at first was considered to be the best grades of crucible tool steel, though later experience tended to prove that chrome steel answered the purpose still better. An analysis of a good steel suitable for ball bearings, he said, probably would show constituents in the following proportion: 1.5 chromium, 0.8 carbon, 0.00002 sulphur, and 0.00002 phosphorus.

Klaxon Revives its Hand-Operated Horn.

Progress sometimes is made in circles, in a way of speaking; that is to say, history repeats itself and things come back to the place where they started. The truth of this is borne out by the fact that the Lovell-McConnell Mfg. Co., of Newark, N. J.,

HAND-OPERATED KLAXON

manufacturer of the Klaxon electric motor horn, has reached back a few years, taken up the original hand-operated Klaxon horn, first produced in 1909, the manufacture of which was discontinued owing to the popularity of the motor-driven signal, and redesigned and improved it and placed it on the market in response to the demand for a hand-operated horn with the real Klaxon tone.

The Klaxon principle of a toothed wheel rotating against a diaphragm is embodied in the new edition of the hand Klaxon; the diaphragm is of vanadium steel and the wheel is operated, through a train of free-running gears, by a push-rod which responds to a very light touch. The wheel turns at high speed and the note given out is the true Klaxon note; the harder the pressure, the faster the speed and the louder the sound. Deliveries will begin November 1 and the price will be $10.

Interesting Survey in Coffin's "Analysis."

The fact that Howard E. Coffin's "Critical Analysis of Motor Cars of 1914," issued this week by the Hudson Motor Car Co., of Detroit, is avowedly written for the purpose of promoting interest in the Hudson six-cylinder automobiles, for which Coffin is responsible, is not by any means a reason for thinking that the little book is uninteresting, or is of value merely as a means of lauding the cars in question. On the contrary, the Hudson cars are hardly mentioned. The idea, which has been carried out in a most interesting manner, is to take up the broader principles and the more general aspects of motor car design and construction, with particular reference to the advantages embodied in the "six." The amount of real information contained in the 55 well written pages is quite sufficient to entitle the book to a place within easy reach of those who are often in need of data on the subjects covered.

Direct Drive Pump for Lent Apparatus.

The Lent Motor Fire Engine Corporation, which was incorporated last week with $250,000 authorized capital, proposes to build an unusual type of self-propelled fire engine in which a new type of centrifugal pump is carried in the waist of the chassis between the engine and the gearset. Contrary to the usual practice, the "wheels" or "runners" of the pump are connected directly to the propeller shaft, with which they rotate. When water is not passing through the pump, they absorb no power, of course, and act merely as a sort of supplementary flywheel. Disconnection of the gearset by means of an ordinary clutch leaves the pump ready for immediate action. The officers of the corporation, which has offices at 2 Rector street, New York, are Leon B. Lent, M. E., president; Francis F. Hine, vice-president; W. R. Fuller, secretary and treasurer. These men, together with Chas. M. Wales, Fred H. Colvin and Fred R. Low, constitute the board of directors of the new company.

Home-Made Lubricant for Ball Bearings.

A good lubricant for ball or roller bearings can be made cheaply and easily by mixing good quality vaseline with light cylinder oil of good quality, the two combining to make a sort of a "slush." To permit the thickened mass to reach all parts of the bearing, it should be heated to reduce its viscosity temporarily. Bearings should then be dipped into it and allowed to remain submerged until the grease has had time to reach all parts, when they can be removed and permitted to cool. If the excess lubricant is wiped off the outside enough will remain in the races to ensure adequate lubrication for a long time. Such a mixture will stay in place and will not run out like lighter oils; at the same time, its viscosity is not sufficient appreciably to increase friction.

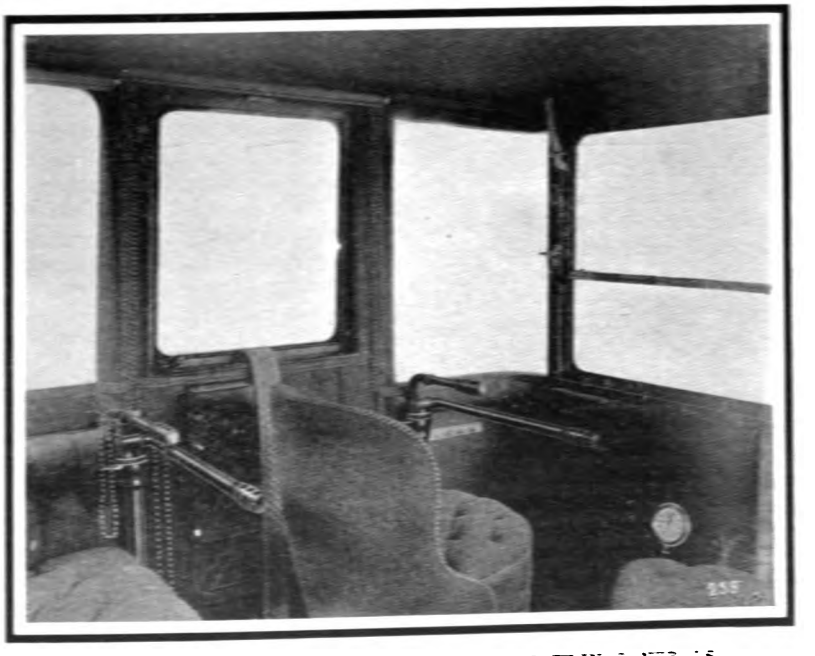
DUPLEX CONTROL SYSTEM IN WORM DRIVEN DETROIT

Five-Passenger Brougham Operated from Front or Rear Seat—Worm or Bevel Gear Drive Optional in Three Models.

The electric motor is about as quiet a unit as human ingenuity is likely to devise and when it is combined with a worm drive and nothing else in the way of driving gear inside of the rear axle, as is the case with the Detroit electric built by the Anderson Electric Car Co. of Detroit, Mich., there is so little excuse for noise that the reason why the Detroit is a smooth-running machine becomes evident. Still if it were not for the fine work that is involved in the fitting and assembling of the parts and the ingenuity and reliability of the control mechanism, there might easily be rattling and squeaking in the various joints and trouble with the means for controlling the current, steering the car and operating the brakes.

The executives of the Anderson company that worm drive is the right drive is the result of three years' use of the system in some of the Detroit models, while other models have been fitted with bevels. The worm and gear are imported, being of the Daimler-Manchester make, and run constantly in a bath of oil, as the worm is underhung, it is constantly submerged in oil, so that the lubrication is perfect.

Though the worm drive is not a new thing in the Detroit electric, there are features that are incorporated in the latest series that have not been previously employed, and chief among them is the duplex drive system which is found in the five-passenger brougham shown in the accompanying illustration. There are two complete sets of controls, one placed for handling from the Pullman type chair at the front of the car, on the left side, and the other set convenient for operation from the rear seat, which incidentally is 51 inches wide and accommodates three passengers. The pedals for the rear control are so placed that when the front seat is swiveled to face forward it covers the pedals; the levers of the manual control drop flat against the side of the car and are quite out of the way.



DETROIT FIVE-PASSENGER DUPLEX DRIVE BROUGHAM

Another Detroit feature is the Haskin rain-vision windshield which is standard equipment of the enclosed models. In this device the upper section of the windshield, which in its entirety fills the whole front of the car, is formed of two parallel sheets of glass with an air-space between them. The two glass sheets are separately adjustable as to angle, and one may be raised and the other lowered, or both raised or lowered at once. In very cold weather with both lowered the utmost protection is afforded from the wind, the dead air space acting as an effective heat insulator. Batteries, which are of a type in which washing out is not required, are easily reached by lifting hoods at front and rear.

The five-passenger brougham is only one of a number of models produced by the Anderson people, though it is a representative one and includes about as much luxury as it seems possible to get into the compass of a motor car. Upon a similar chassis is mounted a four-passenger brougham body with single control only, the driver occupying the rear seat. A type known as the "gentleman's roadster," also fitted with worm-driven rear axle, is an open car with long, sweeping lines. Another open model is the ladies' victoria.

All the cars in the latest series have been reduced in price, despite which improvements have been made in reality. Wheelbases are longer, turning radii shorter by 12 feet, brakes, tires and batteries all have been increased in capacity and numerous detail improvements effected.

Bodies and fenders in all the Detroits are of aluminum, and in the enclosed

INTERIOR OF DETROIT BROUGHAM SHOWING TWIN CONTROLS

Digitized by Google

models the corner panels are of rounded glass. Heavy, deep Turkish upholstery is employed in all models. The fittings for all enclosed cars include an eight-day clock, sunburst lights, Weston electric meter, Warner speedometer, smoking set, cut glass vases and so forth—those touches of completeness that go so far toward making a car attractive and comfortable to ride in.

The price of the five-passenger brougham, with duplex drive, is $3,000. The four-passenger brougham, which has single drive and only one front chair but otherwise is very similar to the five-passenger machine, costs $2,850. The "gentleman's roadster" costs $2,500 and the victoria $2,300. Models regularly equipped with worm-driven rear axles will be fitted with bevel gear drive at a reduction in price. The five-passenger brougham with bevel gear drive and forward control costs only $2,800; and the four-passenger brougham with bevel gear drive and rear control, $2,550.

Dampness that Makes Varnish "Sweat.'

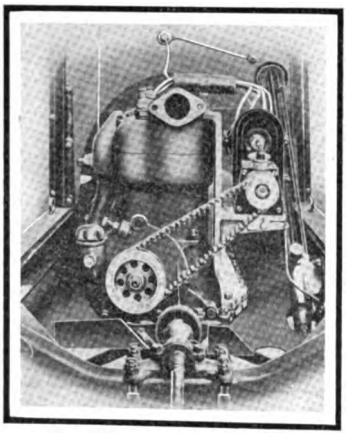
If thorough ventilation of a private garage, or any other garage for that matter, is necessary to dissipate gasolene fumes, it is equally necessary for the preservation of the varnish of the cars housed within it. If the air is damp, the varnish will "sweat" and take on a sort of scum that is disastrous to the finish. The ounce of prevention in this case is an open window or two—and leave them open.

The Advantages of Long Tow Ropes.

It is not often necessary to tow a disabled car nowadays, but when it does become necessary it is a good plan to use a fairly long tow rope, particularly where horses are used to help a car out of a mud hole. The long rope permits the horses to get a better hold and the noise of the racing engine is less likely to disturb them and make them "shy."

Removing Ball or Roller Bearings.

When it becomes necessary to remove ball or roller bearings it should be remembered that it is usually the inner member of the bearing that is a force or press fit on the shaft and operations should be governed accordingly. Generally the outer member is a push fit in the housing and may be easily removed.



Gauge Pressure that May Mislead.

The pressure indicated by a gauge on an air pump while the pump is working usually is higher than the pressure in the tire, due to the loss through friction in the restricted air passages and the valves. The most accurate way is to get a pressure reading direct from the tire itself, thus eliminating possible causes of error.

BOSCH DEVELOPS SIMPLE FORD ENGINE ATTACHMENT

Substitution of Magneto for Coil System Rendered Easy, Leaving Ford Generator for Lights—No Machine Work Required.

For those of the legion of Ford owners who prefer high-tension ignition as supplied by the high-tension magneto with its positiveness and its simplicity, the Bosch Magneto Co. just has developed special attachments which will permit the substitution of a standard type DU4 Bosch magneto for the timer and four-unit spark coil that is a familiar feature on Ford cars. And lest it be assumed by those who are not versed in matters electrical that the change in the ignition system necessitates a pretty thorough knowledge of things electrical and things mechanical, it may be added that the operation is neither difficult nor lengthy nor expensive. It can be done inside of half a day by any motorist who prides himself on being handy with the ordinary garage tools.

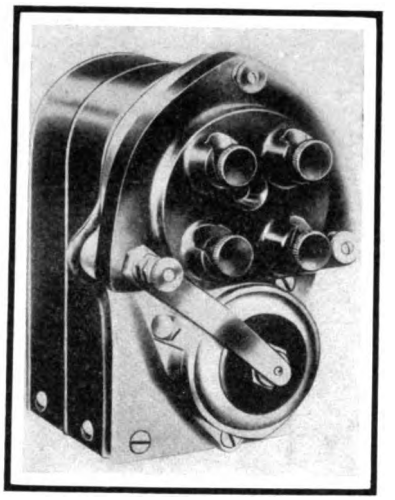
BOSCH FORD ATTACHMENT

The attachment of a Bosch magneto to a Ford engine is not new, of course, though the installation work never has been as simple as it now has been made. The necessity for cutting away any of the crankcase with the resultant danger of oil leakage, has been eliminated, as has the necessity for altering any of the vital parts of the engine. The work of installation requires scarcely more than that the magneto be clamped in place and wired. As for the advantages of the high-tensison magneto: Very few persons need to have it explained that its hot spark ensures the maximum of power: that ignition of the charges is without lag; that the source of current is inexhaustible and that simplicity and positiveness of action are two of the virtues of the magneto that have served to give it its name.

Just how simple the attachment of the Bosch magneto has been rendered may be appreciated when it is stated that it is not even necessary to drill a hole. After the removal of the engine hood, the radiator, the fan and pulley and the commutator or timer, the latter being immediately discarded, the second and fourth cylinder holding bolts and the two forward cylinder head bolts are removed. It is a simple matter then to place in position the special bracket and to fasten it by replacing the bolts that have been removed. Then, when the special driving gear has been fitted to the commutator shaft by means of a pin supplied for the purpose, it remains only to place the magneto on the bracket and fasten it and to place in position the driving chain after the magneto has been properly timed. The work is so simple that it might also be tackled by a schoolboy with a knowledge of how to use a wrench.

The timing operation also is extremely simple and, as laid down by the Bosch company, is as follows: First, bring No. 1 piston to the top center position of the compression stroke. The magneto should then be turned so that the carbon distributor brush rests on No. 1 distributor segment. With the timing lever of the magneto in full retard position, slowly turn the armature in the direction of its rotation until the interrupter points are in the act of opening. At this point the chain should be attached, care being taken to see that the piston has remained at its top stroke position. The distributor disk then is replaced and the ignition cable from distributor segment No. 1 connected to cylinder No. 1, the other cables being connected to their respective cylinders. In order to permit the current being switched off to stop the engine, a dash switch is provided with the equipment which is complete down to every last bolt and screw and nut that is necessary. Full installation instructions are provided with it, as is a wiring diagram.

Another advantage of providing separate high tension ignition is that it leaves the regular low tensison Ford generator without any work to do, though it is a comparatively simple matter to so connect it with a storage battery that the oil lamps can be replaced by electric ones.



Pump Washer from Old Shoe Tongue.

Although the method must be apparent to the really wideawake person, the fact that in an emergency leather pump washer can be made out of the tongue of a shoe in case of necessity is worth chronicling—and remembering.

Digitized by Google

breaker is attached to one end of the armature shaft, with which it rotates. Owing to the action of centrifugal force, the platinum points come in contact in a positive manner at high speed, thus permitting the use of a comparatively weak spring and materially lessening the wear on the cam.

One end of the breaker arm carries a fiber roller which is adjustable for wear. Under this construction, which, with other distinctive features, is covered by patents, the fiber roller comes in contact with a steel cam, causing the platinum points to separate and break the primary circuit. The magneto is self-contained, having both the primary and secondary windings on the armature, the result being that a fat, hot spark follows the interruption of the primary circuit.

SPLITDORF "FORD SPECIAL"

The high-tension winding of the armature is connected to a collector ring or segment, imbedded in a spool mounted on the driving end of the armature shaft. From the collector ring a carbon brush leads the current through a waterproof brush holder to the distributer disk, whence it is distributed to the spark plugs through the usual high-tension ignition cable. In the construction of the instrument particular pains have been taken to ensure against leakage of the current in the connections and cables.

Lower Priced Model Added by Cartercar.

Supplementing its larger model, which lists at $1,600, the Cartercar Co., of Pontiac, Mich., has added a new one which sells, completely equipped with electric lighting and engine starting apparatus, at $1,250. The car, on the whole, is slightly smaller than the higher priced model, though it carries a roomy five-passenger body. Needless to add, it embodies the distinctive Cartercar friction transmission which uses no clutch or gears.

RUNNING DOWN A RATTLE AND FINDING THE CAUSE

How an Owner With Sensitive Ears Traveled a Long Road to a Surprising End—What It Cost Him to Stop the Noise.

He was a man who owned a good car, drove it himself and whose pet particular hobby was the running down and eliminating of all possible sources of noise on the machine—that is, noises that were not normal and unavoidable. Squeaks and rattles were to him as a red rag to a bull, and it was his proudest boast that no stray noise ever escaped him any great length of time. But, as usual, pride preceded a fall, though perhaps the means of wringing from the noise-hunter a confession of defeat were not wholly legitimate.

One day the seeker for silence drove his car into the garage where it was housed and, pointing out the cause of an infinitesimal scraping sound that had assailed his supersensitive ear during the last few miles of a run, requested that it be eliminated forthwith. He stood on one side of the car and the foreman who took his instructions on the other. The foreman leaned carelessly against the rear mudguard and thoughtlessly tapped the sheet metal with the end of a lead-pencil, keeping time with the pulsations of the slowly running motor.

Suddenly the owner paused and bent an intently listening ear.

"Hello!" he ejaculated, "what the devil's that?"

Now, the foreman was not very slow of perception, so he at once perceived that it was the light tapping of his unseen pencil that had perturbed the noise-hunter. And he was not an old man, wherefore he had a little of the spirit of deviltry in his heart and not the strength to withstand the temptation to amuse himself.

"What the devil's what?" he answered. keeping the pencil going just a little more softly.

"Something's rattling. Can't you hear it?"

The foreman listened hard.

"Yes, I hear it," he replied. "Sound's as if it might come from the engine."

The owner went to the throttle, speeded up the motor a trifle and listened again. No sound except the beautifully even firing of a well-kept quartette of cylinders.

"H'm!" he said. "That's queer. I can't hear it now; can you?"

No, the foreman couldn't hear it now. They tried making the motor run slower, and faster, and at all sorts of speeds, but the rattle did not again become evident—that day. On various occasions thereafter, how-

Digitized by Google

ever, when a good opportunity occurred, the foreman's pencil played a gentle tatoo on the rear mudguard—just enough to drive peace from the soul of the noise-hunter and to spur him to superhuman efforts to locate the sound. He left orders at the garage for all sorts of tearing down and delving with a view to locating the sound—all of which work was (not) done and reports duly made that there was absolutely nothing the matter with the machine. And yet, sooner or later, there would come a day when for a brief time there would be a faint, but distinct rat-tat-tat-tat-tat-tat-tat which vanished as mysteriously as it came and did not even last long enough to permit diagnosis.

The thing finally got so much on the owner's nerves that he actually began to seriously consider parting with his car and buying another in which there were no spectral sounds that defied all efforts to eliminate them. At this juncture the foreman relented.

"We've found that noise," he announced one morning, as the car was about to be driven out. "Now will you own up that I'm a better noise exterminator than you are?"

"If you can prove it to me that you speak the truth," said the owner, solemnly, "I'll own up like a man and do the regular penance round the corner."

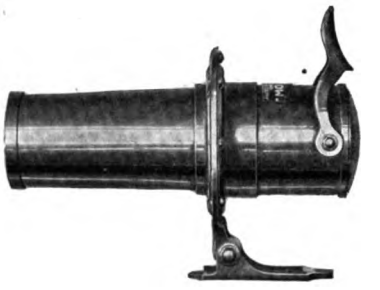
The motor was running at its usual idling speed. The foreman was leaning idly against the rear mudguard. His pencil began the usual tapping and the owner glanced up quickly with a gleam of triumph in his eye.

"You lose!" he said, as the tapping continued.

"I win!" said the foreman. "Look here."

The victim looked, and deep understanding overspread his face. There was just a moment of tenseness, as if the outcome might perhaps be—well, not pleasant. But, after all, he was a good fellow, and it was not long before his laughter joined with the roars of the others who were in at the finish of the game. Suddenly he stopped and grew serious again.

"Who's going to pay for all that work?" he asked.



"Well, said the foreman, "you would have paid for it if it had been done—but it wasn't."

Maxim Tests Silencer for Automobile Use.

Hiram Percy Maxim, of Hartford, Conn., inventor of the gun silencer, visited Syracuse, N. Y., late last week and, using a Franklin car for the purpose, gave a public demonstration of his silencer as applied to automobiles. The Maxim silencer, of course, takes the place of the ordinary muffler, which it closely resembles in form, and permits the cut-out to be used without offending the public ears.

Here's the Newtone Maker's Motophone.

Although its Newtone motor-driven horn will not be discontinued, now that the Automobile Supply Mfg. Co., Brooklyn, N. Y., has turned to the manufacture of hand-operated mechanical horns, as stated in last week's issue of Motor World, more than a clue to the company's own sentiments is contained in its assertion that the new signal is "superior to any motor-driven horn or any other device of the class."

MECHANICALLY OPERATED MOTOPHONE

The new horn, styled the "Motophone," is shown in the accompanying illustration, which, though bringing out the gun-like form, does not reveal the fact that the mechanism is of more than passing interest, including, as it does, a spring governor which regulates the speed of the steel ratchet, the revolutions of which vibrate the diaphragm. However fast the operating lever may be moved, the wheel cannot rotate at more than its proper speed, so that the note given is uniform and steady. One of the advantages of a hand-operated horn is that it is an independent unit requiring no extraneous assistance; and another that is emphasized in the "Motophone" is durability. The makers state that a durability test was made in which 5,000,000 signals were given, and that even after this extraordinary test no adjustments were necessary. The new horn is priced at $12.

Bearing for Radial and Thrust Loads.

The production of a ball bearing that will sustain both radial and thrust loads suggests a number of knotty problems, prominent among which is the fact that if a ball is rolling on one line of contact it must slide to a greater or lesser extent on any other line of contact except that diametrically opposed to the first. By way of overcoming this difficulty, the R. I. V. Co. just has brought out a new type of bearing which is styled "Combination Radi Thrust" bearing and which is quite a little different from other forms of combined radial and thrust bearing; it is shown, so far as its outward appearance is concerned, by the accompanying illustration.

R. I. V. RADI THRUST

The entire problem would seem to have been simply and easily solved by the new bearing, for though it is only slightly wider than the standard type—inside and outside diameters remain the same—it contains two sets of balls each designed to carry separately the full load, radial and thrust, for which it is designed. In other words, one of the rows of balls operates on a surface at right angles to the other row and the surface or thrust plate on the thrust set permits of a full load up to the capacity of the balls being applied at the same time full load is sustained by the radial bearings. The new combination bearing is supplied in all the standard inside and outside diameters.

Cole Blue Book a Blue-Ribbon Catalog.

Of course, it must be that the Cole Blue Book, which just has been issued by the Cole Motor Car Co., of Indianapolis, Ind., is an automobile catalog, for the Cole people say it is. But from the beginning it bears witness to the fact that the intention of the compiler was to make an interesting catalog, one interesting even to those who may not have any particular interest in the Cole car—or any other automobile, for that matter.

It is a complete description of the Cole car, to be sure, but it is good reading and easy reading, and there is a lot of information about cars in general that is really worth while. For the man who is in a hurry to get at some particular point there is a boiled-down set of specifications at the end, without comment or trimmings. And throughout the book, which is "done" in the printer's best style, the advantages of the "standardized" system of car building are brought out clearly and convincingly. Any way it is looked at, the Cole Blue Book is a good little book, worth reading—and keeping.

Auto Parts Adds a Unit Power Plant.

The Auto Parts Mfg. Co., of Muncie, Ind., of which F. N. Boyer is president, has added a complete unit power plant to its productions. The engine employed is a block-cast, four-cylinder motor, with a bore and stroke of 3⅝ x 5 inches, respectively, developing approximately 30 horsepower.

CAR UNDER THE GARAGE ROOF

ınd Avoiding Collisions With the Help of Turntables—
:s Conserve Floor Space—Mechanism That Makes
bout Easily—Installation Methods Made Plain.

things. That was when Day, striking out for himself from the drudgery of working in a machine shop, rented a little shop with borrowed capital and set himself up in the garage business. Since then he has always remembered that business means busy-ness—and he keeps busy.

INTERIOR INSTALLATION SHOWING HOW CAR MAY BE TURNED

Because the shop was a small one—it was fairly deep but it was narrow—cars that were driven in could not be turned once they were under the roof. For a long time Day backed cars out for his patrons. He took the responsibility of damages and damage suits that less experienced owner-drivers might have incurred—and both brakes and Providence were kind to him; he never had an accident. He became very expert at dodging door-jambs and the other cars in the garage and things, animate and inanimate, on the sidewalk.

Flames Make Necessary Quick Action.

Then one day he set to wondering what would happen in case of fire; how he would be able to get the cars under his care out into the street in a hurry if his shed started to go up in smoke. Day was a good driver; he knew he was a good driver and he knew that no good driver, regardless of his qualifications, would ever attempt to drive a car out of a garage backwards at anything faster than a snail's pace; the hazard is entirely too great; might as well burn a car as smash it—to say nothing of the risk to others and to the life of those who always flock to see flames.

Digitized by Google

There remained nothing for him to do but to install a turntable, and he did so after a great deal of deliberation. Suffice it to say that the turntable proved a turning point in his life. Not only did it eliminate the necessity for backing cars out of the garage, thereby removing one big hazard, but it permitted him to increase his business as well, for it made possible the storing of a couple more cars. With the turntable the cars could be turned and placed accurately so as to occupy the minimum of space.

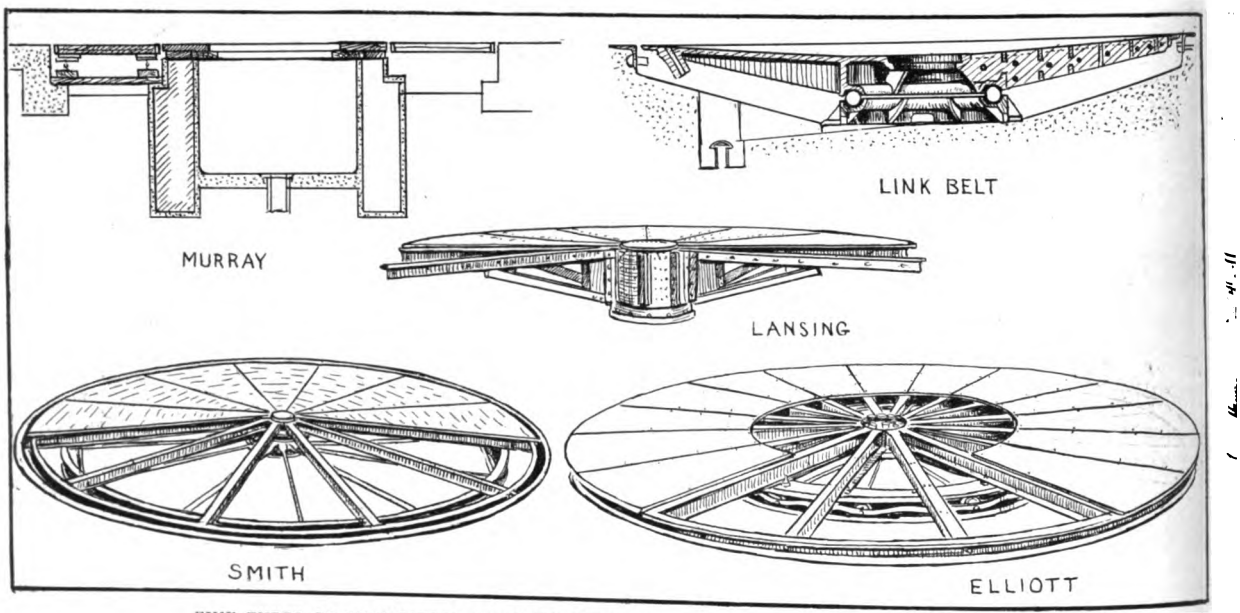
It was his practice to have cars that were driven in by their owners left on the turntable. He and his helper then turned each car and pushed it back into its allotted niche—headed for the door, or, at least, in such a position that it could be driven out behind its radiator and not in front of it.

Devices that Eliminate Maneuvering.

Long ago, Ephraim Day moved out of his little shop and into a much larger one. But he did not move into his new quarters until a turntable had been installed, for though the new garage was a large one, with plenty of room for maneuvering cars around the floor, this maneuvering was one of the evils he eliminated. Every car was turned on the turntable until it could be backed by hand to its station—either on the wash-stand or along the side wall. His patrons took no chance of accident through the careless handling of their cars by garage attendants. None of Day's patrons ever heard the time-worn, threadbare excuse, "Some one backed into your car last night, Mr. So-and-So." Day's success and the success of his garage are directly attributable to his original forethought in seeing the advantages of a turntable.

Big Turntables Will Turn Little Cars.

The turntable that Day bought and installed—he did all the work himself—was one of a dozen or more that are made by as many manufacturers. Day picked it out because it was not expensive and because he figured it was suited to his needs; it was neither too large nor too small. He put in the biggest one he could accommodate between his side walls, because he knew that there is small sense in cutting a big hole for the cat and a smaller one for the kitten. A big turntable will turn little cars, but a little one won't turn big cars. Most manufacturers make them in several sizes, and it behooves any one who would follow in the footsteps of Day to measure first and cut afterwards; to determine the longest car that it likely will be necessary to turn before going ahead.



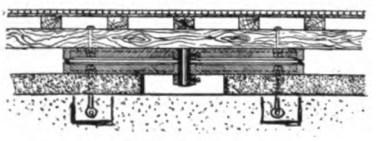
As a typical example of just how a turntable would appear in the small private garage, there are reproduced herewith two photographs showing in one case a turntable installed immediately in front of the garage doors and in the other case within the garage proper. Both of these tables are manufactured by the Canton Foundry & Machine Co., of Canton, O., and their appearance may be taken as indicative of the appearance of almost any of the others under similar circumstances.

Turntables, like everything else that can be included in the category of garage equipment, vary considerably in construction; needless to add, the construction is governed to a certain extent by the price. Some of them turn on wheels; some turn on ball bearings; some turn on plain bearings; some are flush with the floor and some are raised; some of them can be used for a double purpose—washing stand and turntable—and some of them cannot be so used. Altogether there is a wide latitude for choice—too wide, in fact, to permit the description and illustration of more than representative types in each class, in one article.

Figuring the Proper Size to Install.

First: As regards how big a turntable ought to be for a car of a certain wheelbase. It is a simple matter, of course, to measure the wheelbase and to plot the dimension on the floor, but in doing so it should be remembered that the tread also influences the necessary diameter of the turntable and this must be taken into account. Briefly, for cars up to 106 inches wheelbase, a turntable 11 feet in diameter will be required; a car with a wheelbase of 119 inches and standard tread will just go on a turntable of this size, allowing a little more than six inches for flattening of the tires at each end Hence, it is advisable to use the next larger size, which will accommodate cars up to 132 inches wheelbase. For 145, 158 and 171 inches wheelbase—the tread being standard—the turntable diameters necessary are 13, 14 and 15 feet, respectively. In most cases, however, where the wheelbase is fully up to the figures given, it is advisable to use the next larger size turntable.

It is obvious, of course, that to be of prac-

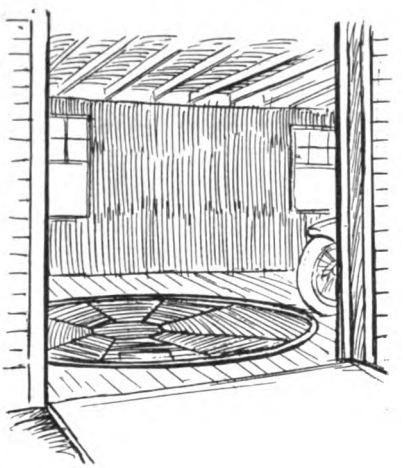


FIVE TYPES OF TURNTABLES SHOWING WIDE DIFFERENCE IN CONSTRUCTION METHODS

Digitized by Google

The top of the table may be either steel, corrugated, or concrete or asphalt or even wood. The standard depth required for installation of the table is 12 inches, though this can be reduced to as little as eight inches at the center and six inches at the periphery.

One unusual feature of the device is that the center bearing is easily adjustable from the outside, and its adjustment permits the

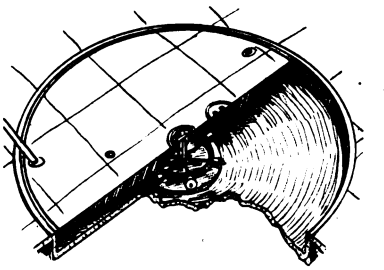


TURNER CONSTRUCTION

raising and lowering of the platform within certain limits. Thus, the settling of foundations in new buildings can be compensated for. Incidentally, the energy required to turn the table can be regulated by adjusting the bearing.

Twelve Bearings Support the Load.

In the Elliott turntable, which is manufactured by the Sterling Elliott Co., of Newton, Mass., all of the load is supported on twelve taper roller bearings, which are placed about midway between the center bearing, which supports little load, and the periphery of the table. These roller bearings are carried in "oil-less" bushings and never require attention. Hence, it is a simple matter requiring only that proper drains



ERNST INSTALLATION

be provided, to employ the turntable also as a washing stand. The construction of the turntable itself is quite clear in the accompanynig picture, the radiating members being I-beam steel strongly fastened to the king bolt at the center. The floor is made of steel held in place by screws.

The Northern turntable, which is produced by the Northern Engineering Works of Detroit, Mich., is not unlike the Elliott in operation, the load being carried on a series of rollers placed between the center of the table and the periphery, though the construction is radically different. In the first place, the table itself is constructed of reinforced concrete; where a concrete foundation is necessary in any case, this may be an advantage, for the table top can be set at the same time the foundation is put in. The roller construction is shown clearly in the picture, which makes plain that the rollers are tapered and that friction therefore has been reduced to the minimum. This turntable, too, can be used as a wash stand, the waste water draining away through the center pin. The table is made in several sizes, from 11 to 15 feet in diameter; the depth required for all of them is 16 inches.

The Turner turntable, manufactured by the Turner Mfg. Co., of Danbury, Conn., is another in which the load is supported on bearings between the center of the table and the periphery, only in this case the bear-

NORTHERN ROLLER BEARING

ings are large diameter balls held between two races, one of which is stationary and is bolted to the foundation and the other is fastened to the table top itself. These two races, in fact, and the balls between them constitute the whole working mechanism of the turntable. Where the fireproof qualities of a steel or concrete top table are not required, a wooden top can be built up on the Turner foundation at the minimum cost, the lumber required being purchased locally. To prevent the dislodgement of either balls or races, the two are held in proper relationship with each other by means of a central king bolt which is 3½ inches in diameter.

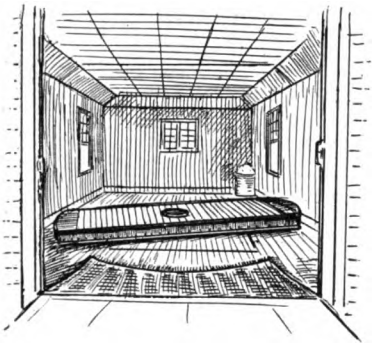
One Ball Bearing Used in Link-Belt.

A single immense ball bearing also is used to support the load in the Link-Belt turntable manufactured by the Link-Belt Co. of Chicago, Ill., only in this case the bearing races are smaller in diameter and therefore are nearer to the center of the table. In the sectional view of the table that it shown herewith, it is plain that the top member and the upper race are cast in a single rigid piece. For convenience in ship-

Digitized by Google

ping, however, the table top is split into three segments which afterward are bolted together.

The under race is securely fastened to the foundation, which is of concrete and is provided with a sewer connection so that the table can be used as a wash stand when necessary. The table top is drained to the center, where there is a large, removable grating. The bearing is thoroughly protected from water and grit and a hand hole is provided for cleaning the drain. The table is made in three sizes—namely, 12 feet 6 inches, 13 feet 4 inches and 14 feet 6 inches in diameter, the largest size therefore accommodating standard tread cars up to 144 inches wheelbase.



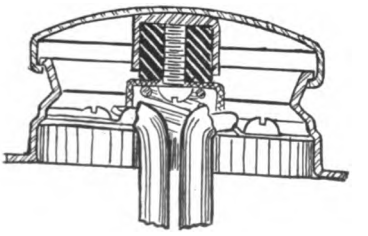
King Pin Meets the Reaction.

The Ernst turntable, which is manufactured by C. F. Ernst's Sons of Buffalo, N. Y., is another in which the load is carried on a great ball bearing, though it is placed slightly nearer to the center than are any of the others. In the sectional view of the bearing, which is reproduced herewith, the arrangement of the bearing and the component parts of the table is made plain, the reaction, occurring when a car is being driven upon the turntable, being taken by a substantial king pin in the center. In another type, constructed for installation on upper floors where the depth obtainable is limited, the reaction is taken by a second set of balls mounted beneath the ones that normally carry the load. As is the case with most of the other turntables, the bearings in the Ernst are protected from water and sand and the table can be used as a wash stand without fear of harming it. The diameters of the standard models range from 12 to 18 feet.

But One Part Needs Lubricating.

The Lansing table, which is produced by the Lansing Co., of Lansing, Mich., has its bearings entirely enclosed within the central pedestal member, as shown by the picture, and though this bearing its quite close to the center of the table, as it is in those that employ a great ball bearing, six horizontal wheels serve to support the load. The dead load is carried by 20 sheaves radiating from the central pedestal. The only part requiring lubrication is the king bolt and provision is made for applying the oil from the top through a hand hole. The depth of the pit required, including the foundation, is approximately 36 inches and the diameters of the several sizes furnished range from 12 feet 6 inches to 20 feet. In another style of Lansing turntable—it is not illustrated—the radiating members are securely fastened to a special circular track bearing on the rollers which, in turn, are mounted in another track secured to the foundation. For this type of table the depth required is only 24 inches.

The Nichols turntable, which is produced by George P. Nichols & Bro., of Chicago, Ill., is entirely different from any of the



ELLIOTT PITLESS TABLE

others, its most prominent point of difference being that it requires no pit. As a matter of fact, the whole of it—or, at least, the whole of the visible part of it—is above the floor. Although it was designed essentially for use in a one-car garage—the small private garage, for instance—it can be used in a public garage where conditions prohibit the excavation of the pit necessary for other types. Incidentally, despite the fact that it is above the floor, it has no rails.

As is the case with so many of the other turntables, the load on the Nichols is supported on a central ball bearing of substantial construction, the lower race of which is set into the floor and fastened to a concrete block about three feet square. At the entrance end of the table, a single roller set nearly flush with the floor serves to relieve the strain on the king bolt when a car is being driven on, but when the car is centered the whole of the load is carried by the central bearing. The decking is yellow pine and for simplicity the runway leading to the table may be nothing more than two strips of concrete.

Push-Button that Overcomes Faults.

It is altogether likely that more than one person has "cussed" his electric signal horn

SPARTON SWITCH BUTTON

button with a great deal of fervor when it may have been due to no fault of the button at all, or rather of the construction of the button or its ability to make the necessary connection that must result in a warning growl. Most buttons of the kind are small, and it is not always easy to find them promptly with a finger, and this is particularly so when heavy driving gloves are worn; it remains, however, that if the button were properly pressed it would perform the function for which it was designed; the only necessity is to press it properly.

All of which has been remembered by the Sparks-Withington Co., of Jackson, Mich., and in bringing out a new type of button for use with its Sparton horns it has almost literally gone the limit in making the button not only easy to operate but in making it of such size that it cannot well be overlooked, let alone be missed when it is looked for, or felt for, as is more usually the case. A section of the button itself is shown by the accompanying illustration. Aside from the fact that the button is considerably larger than usual, it has another and probably more important advantage in that it will make the necessary contact regardless of whether it is pressed squarely down or only its edge is depressed. In other words, it makes no difference at what angle or what part of the button is touched, for the horn will swell its warning just the same; even mittens need have no terror for the driver who relies on his horn as much as he does on his good brakes. Externally, the button is finished in black satin enamel which makes for inconspicuous appearance combined with durability and a color that is not likely to "clash" with rich fittings.

Glycerine and Graphite for Clutches.

Fuller's earth generally is recommended for clutches that slip when they ought to grip, but something that is very nearly as desirable, and much easier to apply, is glycerine. It can be poured on the leather out of the bottle, and if there is any tendency for the clutch to grip too suddenly, a little graphite can be added to the glycerine.

Scraping Cylinders Requires Care.

When removing carbon deposits from cylinders with a scraper, great care should be taken to see that the surfaces are not marred by the tool, which generally is made of very hard material. It is not a hard job to loosen the carbon and the less force that is used the better it will be for the cylinders.

Another Tire Branch in Los Angeles.

The American Tire & Rubber Co., of Akron, Ohio, whose chief production is the American Indian red inner tube, has opened a branch at 112 East Pico street, Los Angeles. It is in charge of M. J. O'Sullivan.

Guide Adds a Two-in-One Lamp.

Ill blows the wind which profits nobody, says one version of the old saw; and though the legal blast that blew out the dazzling headlights in the streets of New York and Chicago caused a little grumbling in some quarters, perhaps, it not only relieved drivers and pedestrians of not a few dan-

GUIDE DOUBLE PURPOSE LAMP

gers, but it blew a good bit of new business into the hands of the lamp manufacturers, who have been prompt to do their part in preventing the violation of the law.

One of the neatest and one of the most recent of the devices that permit a penetrating searchlight effect in the country and a useful but harmless little illumination for city streets is the double lamp that has come from the shops of the Guide Motor Lamp Mfg. Co., of Cleveland, Ohio, and rejoices in the designation "Guide special double bulb de luxe." As a matter of fact, the accompanying picture tells the story of the lamp so clearly that it is necessary only to add that the reflector, which has a 12-inch front, is fitted with a 16-candlepower main bulb and a 2-candlepower city light bulb in a little semi-reflector of its own let into the top of the main reflector; the rays from the small lamp are thrown downward on the road. The wiring is double and, of course, the lights are independently controlled. In addition to the fact that this lamp permits compliance with the law without inconvenience to the driver of the car, there is a distinct saving of current when the small light is turned on.

SMASH ADDS TO THRILLS AT KALAMAZOO RACEMEET

Benedict Rips Down Fence in Free-for-All and Burman Just Saves Himself—Moross Star to Quit Racing.

George Benedict, only ten days out of the hospital as a result of the wreck that killed Harry Endicott, at Jackson, Mich., had another very close call on Saturday last, 27th ult., on a mile dirt track in Kalamazoo, Mich., when his car got beyond his control in a free-for-all handicap event and ripped away a big slice of fence. Tearing along behind Benedict, Bob Burman did not quite steer his big Benz clear of the wrecked car and only by quick action was a double tragedy averted. As it is, Burman was so badly scared by the accident that he has announced his intention of quitting the hazardous business in which he is engaged. He is credited with having stated that when his present contract expires—it only covers one more racemeet—he will retire.

Benedict was driving a Buick at the time of the accident, and according to those who saw it, the wreck was due to the fact that he attempted to take the backstretch curve at too great speed; it is estimated that he "went into" the curve at more than 70 miles an hour. In the skid that ensued a great cloud of dust was raised and obscured Burman's vision, with the result that he only partly succeeded in avoiding the debris left by Benedict's car. Benedict sustained a broken rib and internal injuries and Burman's face and hip were cut.

The races that preceded the free-for-all handicap event that ended with Benedict's accident were mostly time trials and exhibitions and most of them were by Burman. At the wheel of his Benz he reeled off one mile in 50¼ seconds and this time was not beaten. Benedict drove the mile in a Mercedes in 55 seconds, and Harry Scott, at the wheel of a Mercer, required 1:08. As usual, Burman won nearly all the events.

Vanderbilt and Grand Prix Seem Lost.

Hope seems to be about all there is left for the holding of the Grand Prix and Vanderbilt races this year, and there is not a great deal of that. Having been unsuccessful in obtaining in New York the Peugeot entries he traveled from Savannah to obtain, President Harvey Granger, of the Savannah Automobile Club, has returned home, and as these entries are lacking, it does not seem likely that the others upon which he depended to make a list of 10 starters will materialize before the entry lists close on October 5th.

1,057,130. Shock-Absorber for Automobiles. Andrew Bohm, Morristown, N. J. Filed Oct. 21, 1911. Serial No. 655,918. (Friction shock-absorber.) 6 claims.

1,057,044. Pneumatic Anti-Slip Device for Power Driven Vehicles. Benjamin Douglass, Jr., Orange, N. J. Filed Jan. 16, 1913. Serial No. 742,321. (Exhaust pressure road sander.) 3 claims.

1,057,047. Vehicle Wheel. George J. Engert, Spokane, Wash. Filed Jan. 30, 1912. Serial No. 674,406. (Wheel with S-shaped spring spokes.) 1 claim.

1,057,063. Internal-Combustion Engine. Hans Knudsen, London, England. Filed Nov. 18, 1911. Serial No. 660,976. (Means for air-cooling pistons.) 2 claims.

1,057,083. Vehicle Tire. Max Cyrus Overman, New York, N. Y. Filed Nov. 4, 1911. Serial No. 658,459. (Cushion tire with internal annular air chamber and deeply serrated tread.) 7 claims.

1,057,092. Resilient Wheel. Fredereick M. Ross, Oakley, Ohio, assignor of one-half to Willard W. Baxter, Newport, Ky. Filed Jan. 15, 1912. Serial No. 671,239. (Wheel with spring-supported hub.) 2 claims.

1,057,105. Shock-Absorber for Vehicles. Joseph Wolpert, New Brunswick, N. J., assignor to Joseph F. Wolpert and Edward A. Meagher, New Brunswick, N. J. Filed May 14, 1912. Serial No. 697,130. (Double-armer friction shock-absorber.) 5 claims.

1,057,127. Motor Vehicle. Philip T. Dodge, Washington, D. C. Filed Sept. 25, 1908. Serial No. 454,782. (Limit stop for steering gears.) 5 claims.

1,057,228. Dirigible Headlight for Vehicles.) Jas. Austin Ellison, Wilmington, Del. Filed Sept. 7, 1912. Serial No. 719,069. (Headlights moved by steering gear.) 10 claims.

1,057,232. Tire. John R. Gammeter, Akron, Ohio, assignor, by mesne assignments, to the B. F. Goodrich Co., New York, N. Y., a corporation of New York. Filed July 8, 1911. Serial No. 637,426. (Cord tire construction.) 8 claims.

1,057,254. Carburetter. William H. McAndrews, Chicago, Ill. Filed Nov. 3, 1905. Serial No. 285,738. (Air pressure carburetter control.) 2 claims.

1,057,292. Shock-Absorber. Charles N. Sowden, Guantanamo, Cuba. Filed June 12, 1912. Serial No. 703,156. (Double-Armed Shock Absorber with friction disks.) 4 claims.

1,057,294. Radiator. Emil Carl Friedrich Streichert, Lockport, N. Y., assignor to The Harrison Radiator Co., Lockport, N. Y., a corporation of New York. Filed Oct. 16, 1911. Serial No. 654,962. (Sheet metal radiator construction.) 1 claim.

1,057,297. Rotary-Valve Packing. Eugene Henri Tartrais, Montmorency, France. Filed June 15, 1912. Serial No. 703,852. (Means for making rotary valves gas-tight.) 1 claim .

1,057,300. Wheel. Clarence L. Tomlinson, Portland, Ore., assignor to Northwestern Wheel & Wagon Co., Bellingham, Wash., a corporation. Filed April 3, 1912. Serial No. 688,297. (Wheel with tapered expanding hub member for tightening spokes.) 1 claim.

1,057,388. Emergency Automobile-Tire. Frank L. Bigsby, Kirksville, Mo. Filed Oct. 3, 1911. Serial No. 652,673. (Fastening device for emergency tire.) 2 claims.

1,057,398. Vehicle Tire. Grover C. Allison, Louisville, Ohio. Filed Jan. 22, 1912. Serial No. 672,753. (Solid tire with annular tongue fitting annular slot in rim.) 1 claim.

1,057,399. Valve-Gear for Internal-Combustion Engines. Daniel Appel, East Cleveland, Ohio. Continuation of application Serial No. 571,472, filed July 11, 1910. This application filed May 31, 1912. Serial No. 700,555. (Piston valve and eccentric operating means.) 10 claims.

1,057,409. Headlight. Frank Buchanan, Syracuse, N. Y. Filed April 24, 1911. Serial No. 622,878. (Electric headlight construction.) 8 claims.

1,057,439. Tire-Patching Device. Gustave J. Martel, Chicago, Ill. Filed June 5, 1911. Serial No. 631,274. (Blow-out patch and securing means.) 2 claims.

1,057,440. Tire-Patching Device. Gustave J. Martel, Chicago, Ill. Filed June 5, 1911. Serial No. 631,275. (Blow-out patch and securing means.) 1 claim.

1,057,442. Sleeve-Type Two-Cycle Engine. Clarence D. Miller, Philadelphia, Pa., assignor of one-third to Harry F. Haviland and one-third to Warren J. Miller, Philadelphia, Pa. Filed Feb. 7, 1911. Serial No. 607,137. (Sleeve valve two-cycle motor.) 3 claims.

1,057,451. Tire-Filling Machine. Elmer Oliver, Daytona, Fla. Filed Dec. 23, 1911. Serial No. 667,565. (Machine for injecting filling into pneumatic tires.) 6 claims.

1,057,452. Shock-Absorber. Adolph Peteler, New York, N. Y. Filed Nov. 26, 1912. Serial No. 733,594. (Hydraulic shock absorber.) 7 claims.

1,057,466. Power-Transmission Mechanism. Clarence W. Taylor, Chicago, Ill., assignor to Agnes Poage Taylor, Chicago, Ill. Filed Nov. 18, 1912. Serial No. 731,934. (Roller clutch rear axle construction.) 3 claims.

1,057,467. Vehicle Tire. Charles S. Turner, Akron, Ohio, assignor to The Firestone Tire & Rubber Co., Akron, Ohio, a corporation of Ohio. Filed Feb. 6, 1911. Serial No. 606,983. (Bolted flange solid tire.) 1 claim.

STATEMENT OF OWNERSHIP.

Statement of the ownership, management, etc., of the Motor World, published weekly at New York, N. Y. Printed as required by the Act of Congress, August 24, 1912.

Name of editor, R. G. Betts.

Post Office Address, 1600 Broadway, New York, N. Y.

Managing Editor, R. G. Betts.

Business Managers, A. B. Swetland, 1600 Broadway, New York, N. Y., and F. V. Clark, 1600 Broadway, New York, N. Y.

Publishers, Motor World Publishing Company, 1600 Broadway, New York, N. Y.

Owners: All stock, except qualifying stock of directors, held by the A. B. Swetland Company, 1600 Broadway, New York, N. Y.

Known bondholders, mortgagees and other security holders, holding one per cent. or more of total amount of bonds, mortgages or other securities:—None.

Signed, Motor World Publishing Company, F. V. Clark, Business Manager.

Sworn to and subscribed to before me this 22nd day of September, 1913. Leah Goldman, Commissioner of Deeds, No. 71. Commission expires February, 1915.

Miles in Competition

One question in a million brains

All over this country there are men asking the same question *you* are asking yourself. In the stone front city salesroom; in the small town garage; in the offices and factories, serious-minded, thinking men are asking; "What is to be the future of the motor car business?"

Stronger and stronger glares the spot light of truth on the situation. More and more the public sees and realizes the truth. The answer to the question is found today in the public confidence. The dealer who can not see what the public sees; the dealer who fails to hear what the public says, will get a sad answer in the future. The same applies to the manufacturer. Opinions may differ in details, but the fact remains that the manufacturer who has proven his honesty, sincerity, and his here-to-stayness is the one who is being elevated to the highest level of public confidence today.

The methods of manufacturers and their selling policies decide their measure of true worth—or lack of it.

The dealer deals himself a poor deal, if he deals with any builder but the one who is here-to-stay.

The future of the motor car business is *good*.

Good for what?

Good for the good builder and good dealer.

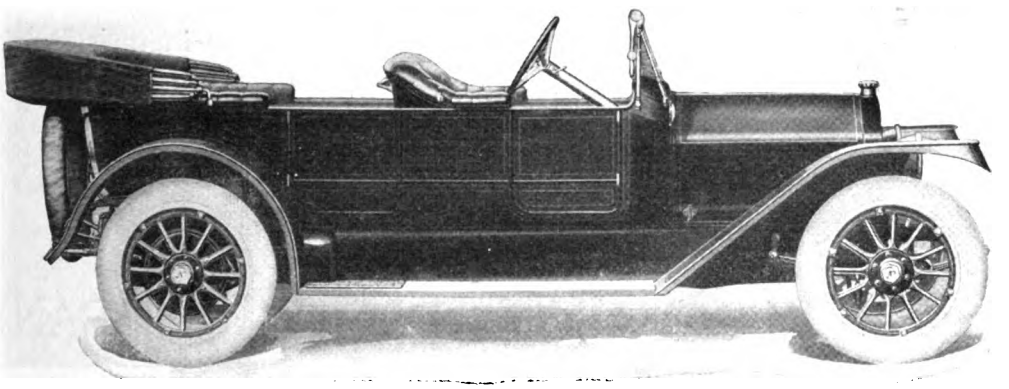
You simply can't be a good dealer for a bad builder. Your hard work and cleverness can not outweigh the faults of the builder. Why spend your money and your labor to try and make good for a bad builder?

More cars than ever before will be bought this coming season. The educated public will buy them. You can't fool them. You only fool yourself in trying to do that.

The public wants its money's worth; it wants to buy where it has confidence in the car builder, the car's reputation and the prestige and rating of the manufacturer.

A car can rise no higher than its source, its factory.

A dealer can rise no higher than his car.



Catalog specifications, the paint on the hood, and salesman's speeches are futile if the car is lacking or the builders are not absolutely responsible and firm.

It is inevitable that the reputable builder with square methods of dealing with customers and who produces the greatest value in his cars, is the one who will have the confidence of the public. The *National* wins business and customers for you.

We repeat: For a car of quality, power in abundance, speed in emergencies, dependability, reliable and always efficient service, perfect control, convenience and comfort, there is no better car built than the *National*.

This is a matter of record, in tests and actual demonstrations of all kinds. This is guaranteed by a thirteen-year-old company with unimpeachable rating and good will. The *National* company is stable; it is here to stay because it is right in its methods of giving the public the one service that counts—*quality*.

The answer found in the *National* car

NEW DEPARTURE BALL BEARINGS

American-Made for American Trade

The Proof of the Bearing Is In Its Service

The garage man knows better than anybody the comparative service merit of the bearings installed in motor cars he cares for and repairs.

We recently sent out letters to garage men throughout the country, asking them their opinion of New Departure Ball Bearings, based on their experience with it.

The complete summary of all responses received the first week shows that 96 per cent. of the garage men who have been using New Departures found them absolutely satisfactory. Many of them went as far as to say that it has proved superior to all others.

This remarkable evidence of the quality and efficiency of New Departure Ball Bearings is absolutely indisputable, and should appeal not only to garage men who are using foreign-made ball bearings in their replacement work, but to the American manufacturer of motor cars.

Every manufacturer, purchasing agent, superintendent, and designing engineer should have the Engineering Edition of the New Departure Ball Bearing Catalog and the brochure on "Bearing Friction and Its Elimination."

Every garage proprietor and superintendent should have the new Ball Bearing Garage Manual, now in its third edition. Either one, or all of these books, will be sent free on request. Drop us a line now.

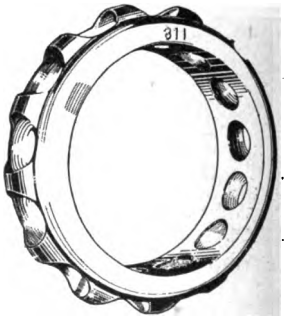
Ball Bearing Essentials

Full Complement of Balls
Full Depth of Raceways
Uninterrupted Raceways
Solid One-Piece Separator

CAPACITY GURNEY ENDURANCE



THE real merit of Gurney Ball Bearings is best understood when each of the four essentials is considered by itself as to the functions it performs; then in relation to the others and the functions they perform in the general scheme of a ball bearing.

EACH Gurney Bearing has **a Full Complement of Balls** so that its load capacity is in no way impaired. By the use of the Gurney one piece separator, it is practical to run the balls much closer together than with any other type separator.

EXHAUSTIVE experiments have demonstrated that a **Full Depth Raceway** 4 per cent. greater in radius than the ball brings about the most efficient relation between the two. Any variation more or less than 4 per cent. either decreases load capacity or increases friction. If the race contour be closer to the ball curve than 4 per cent. the area of contact between the ball and the raceway is increased and the friction correspondingly becomes excessive. If the raceways conform less closely to the ball curve the area of contact is decreased sufficiently to lessen the carrying capacity of the bearing without materially reducing the friction.

IT is obvious that **Uninterrupted Raceways** are superior to slotted or interrupted raceways of any type—for an uninterrupted raceway means a greater thrust capacity than one which is slotted; as well as being a superior manufacturing proposition from every viewpoint.

THE **Gurney One-Price Separator** is die cast from special wear resisting alloy. The partition or septum between each pair of balls is so efficient and durable that it does not have to be so thick as to displace any of the balls and thus reduce the capacity of the bearing. Cast in one piece there are no joints, screws or clips to interfere with its performance, life or strength.

IN considering ball bearings always bear in mind that more important even than the obvious essentials mentioned above is the question of raceway contour—for just as far as you fall short of right contour just so much do you fail to realize the full efficiency to which you are entitled.

Built strong and durable.
Pleasing and graceful lines.
Simple in design and construction.
Easy to operate and steer.
Will turn in 15 foot radius.
Comfortable to ride in.
A smooth running, vibrationless motor.
Silent in its action.
Powerful and speedy.
Economical on gas, oil and tires.
Will climb ANY hill.
Economical factory management.
A sane sales policy.
Greatest efficiency throughout the organization.

—consequently—

Greatest value for the money

FITS THE TREMENDOUS DEMAND

Thousands of Dealers and prospective owners have been watching and waiting for the right car at the right price. YOU have often predicted that SOME ONE would bring out a car that would adequately fill the great popular demand. Others have hit all around the mark, but the Vulcan is the first to hit the bull's-eye.

A TRULY REMARKABLE CAR

A machine which takes its place in the front rank immediately—FAR IN ADVANCE of anything yet announced. Will climb ANY hill where the wheels will hold, and stand the SEVEREST tests to which a car can be subjected. BUILT, not "assembled" only. A car with NO OBJECTIONABLE FEATURES.

WE CAN DELIVER THE GOODS

The Vulcan is being manufactured on an extensive scale. It will be one of the most important factors in the light car field for 1914. In addition to our present large factories, we are preparing to invest millions in additional capacity. Arrangements are already in force, whereby the growth of the plant will keep steady pace with the demands of our Dealers.

The Vulcan is not of "Mushroom Growth"—YEARS have been spent in the perfection of the car and equipping to manufacture in LARGE QUANTITIES.

This announcement is NOT premature, but has been purposely withheld until the progress reached the point when deliveries of 1914 models could be positively assured.

DEALERS GET IN LINE

This is YOUR opportunity, but QUICK ACTION is imperative—we shall not oversell our capacity—we are appointing only a limited number of Dealers—no more than we are able to supply with a reasonable number of cars each during the season. The Vulcan Dealer's Agreement is the FAIREST EVER OFFERED. Protects the DEALER as well as the Producer. Automatic renewal feature makes the dealer a PERMANENT part of the Sales Organization. WIRE by Night Message for option on your City or Town, pending arrival of letter.

Ergon Motors

Ergon Standards

Ergon Motors are built in three sizes, each size available for prompt delivery in unit plant type. Each motor is of the four cylinder, four cycle, L head type, cylinders cast in pairs. Cooling is accomplished by water pump and lubrication by fore feed splash system of exceptional efficiency. Model C, 3¾ x 4½; Model CX, 4 x 4½, and the Model D, 4⅜ x 6.

It has been found best to depend upon outside manufacturers for certain special parts of Ergon Motors. For instance:

Bearings

In the unit plant type motors we use Timken Bearings in the transmission; the clutch is supported upon F & S Bearings. All bushings are made of the best obtainable anti-friction and anti-wear material to be had.

Crank Shafts

The Driggs-Seabury Ordnance Corporation, of Sharon, Pa., forge our crank shafts and connecting rods. Their reputation for this sort of work is second to none in the country.

Clutch and Gearset

Models C and CX are equipped with multiple disc clutches in oil. Model D employs the Brown-Lipe dry-plate clutch. All motors in the unit plant type have three speed selective type transmission. When specified, Model D will be supplied as an independent sub-frame motor.

Silent Chain

In the Model D a Renold Silent Chain drives the magneto, pump and valve actuating mechanism, replacing timing gears.

Valves

All valves are enclosed in such a manner that they are readily accessible. The valves themselves are exceptionally large.

In General

In their general makeup Ergon Motors show a very high development in motor standards. In performance they invariably exceed expectations. Motor building is our specialty and we have bent every effort to make Ergon Motors stand for the best in that particular field of endeavor. We have had to enlarge our factory recently to take care of our rapidly growing business, and a thing we point to with pride is the fact that Ergon Motors have made good in every instance, both on pleasure cars and trucks.

A New Six–for

Every Feature Standard and the Highest of its Class in Quality and Reputation

5 Passenger Touring Car,

¶ The **S & M** Six is a new car in name, in value, in sales opportunities; but it is already an established car by reason that it is constructed throughout of standard parts that represent the very highest achievement of the best American parts makers. There is nothing in the **S & M** Six that has not already made its reputation.

¶ This car is being built in Detroit; it embraces nothing but 1914 features; has not a left-over anywhere; will not strive for big quantity production; and is built by men who, in addition to manufacturing experience, have had years of valuable experience in the selling end of the business of importing the highest priced, highest grade car in the world—the Rolls-Royce—and high quality American cars. In fact the **S & M** is brought out because their experience shows that at a MEDIUM price the market heretofore has offered no Six with all the right qualifications.

¶ The right qualifications, as you will admit, are as follows: first—a Six—it is the ideal type; second—the best standard parts of the acknowledged specialists; third—light weight, meaning low upkeep; fourth—extraordinary beauty; lastly—a right price.

S. & M. MOTOR CO., Inc.

Specifications:

CONTINENTAL

¶ America's Standard Motor — the finest six cylinder engine produced. Noiseless, light in weight but a giant of energy, developing 58 h. p. by brake test. Three point suspension. Cylinders cast in sets of three. Enclosed valves.

TIMKEN

¶ Acknowledged to be the best in axles and bearings—actually without competition. A guarantee of maximum safety and durability at the points of greatest stress.

BROWN-LIPE

¶ Transmission of highest grade, superior in workmanship, produced by a plant in which $3,000,000 has been invested. No "manufactured" car at any reasonable price can compete with the work of these transmission specialists.

GEMMER

¶ Steering gears specified by over 50% of the leading automobile firms of America. A solid assurance of satisfaction and safety. Known to all motorists as a leader.

JESCO

¶ The ideal lighting and starting system. Does not abuse the batteries, but starts the motor unfailingly. Lightest in weight and most compact in construction.

WARNER

¶ The best speedometer made, accurate, reliable, used on the highest priced cars.

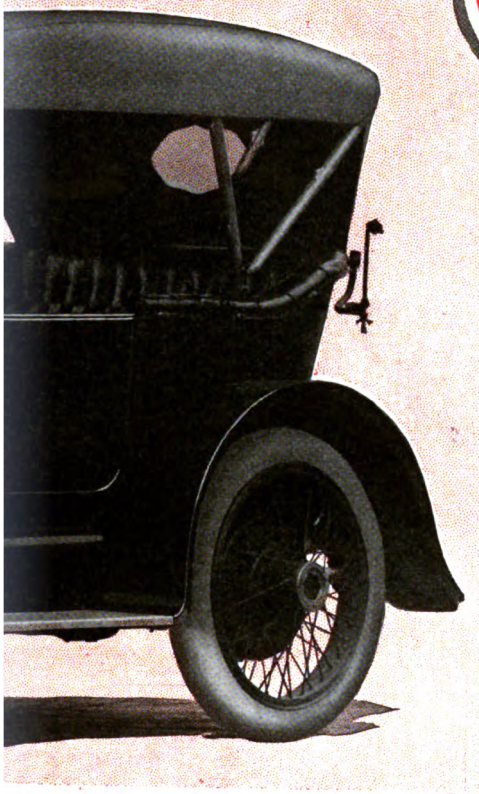
MAYO

¶ Cell honeycomb, handsome, trouble proof. Backed by a big, strong company. No better radiator made.

McCUE

¶ Wire wheels — the latest improvement in motor car construction. Add resiliency and increase tire mileage.

ROSTAND



¶ A windshield beyond comparison, the neatest and most attractive manufactured. Rain vision, clear vision, ventilating. Mirror-plate glass set in solid cast bronze frame, enameled. Special fittings attach top to shield, doing away with leather straps.

¶ All these features are of unparalleled excellence. Yet they are but a few of all the S & M offers. Among others may be listed:

Full floating rear axle.
Aluminum hood.
14 vital parts of chrome nickel steel.
130-inch wheelbase.
Left-hand drive, center control.
Short turning radius.
Bosch dual ignition.
German silver radiator casing.
Brewster-style fenders.
2 Thermos bottles.
Genuine hand-buffed leather upholstering.

Digitized by Google

Market

ınd the specifications at the left tell the
ɜt and dealer. Continental for motors;
emmer for steering gears; Brown-Lipe
ors; Warner for speedometers; McCue
er, show that, irrespective of price, the
l by any car of American or European

ve not been able heretofore to supply.
re to be manufacturers, but an intimate
ands is behind the **S & M** Six. That—
from years of experience, that the car
ɜts, is the best car it is possible to pro-
oduce.

ɜ. But there are no other cars with the
hroughout.

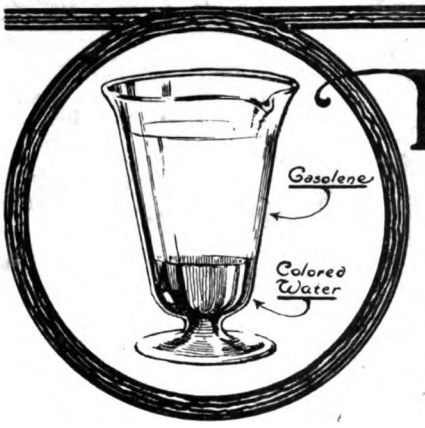
ices:

Roadster, 2 passenger.....$2485.00
Speedster, 2 " $2485.00
7 passenger, $3750.00

etroit, Michigan

For Dealers:

¶ "A New Six for a New Market" is not a catch phrase. It is based on the six years' experience of the manufacturers of the **S & M.** There are numerous Sixes in the market—a great many of them experiments, and not one of them answering, as does the **S & M,** the steady demand for something that looks better and is better in action — at a better price.



¶ It goes without saying that such a Six must be a proved car. Some other Sixes are proved—by age—at the cost of a big overhead. The **S & M** is proved—by the science and acknowledged pre-eminence of the specialists who build its parts—without a cent of excess overhead.

¶ The **S & M** offers to the better class of dealers a Quality Car without competition in appearance, in price, and in material. Every purchaser of a car of the class of the **S & M** knows without argument that every one of its parts is the best procurable. The list of firms building these parts is the soundest "selling talk" that ever backed up any automobile.

¶ ***And the S & M plan of co-operation with dealers is so much better that you should learn of it immediately. Every dealer in quality cars should get the S & M proposition at once.***

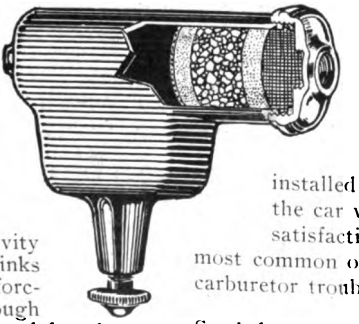
Water in Gasolene

Efficiency of Ellis Gravity Separation Method. A Test.

Into a graduated glass nearly full of gasolene a small quantity of water, colored red to distinguish it, was poured. In spite of repeated efforts to make it mix with the gasolene the red water sank to the bottom. When the contents of the glass were run through the Purifier only the uncolored liquid came out. The red liquid, in exactly the same quantity as originally measured into the glass, drained out of the precipitation chamber when the valve was opened.

NO matter how good carburetors may be made or how perfectly they are adjusted there always will be as much carburetor trouble as now unless some adequate remedy is applied to the fuel.



The carburetor itself is seldom to blame for carburetor trouble. It is the impurities in commercial gasolene that make trouble.

Dirt, grit and sediment may be eliminated from fuel by careful screening but there still is the water to contend with.

However water gets into gasolene, whether by carelessness or by condensation of the atmosphere in a gas tank, the fact remains that in a short time enough accumulates in a carburetor to make trouble.

The Ellis Gasolene Purifier

by means of a series of screens and filters, catches all solid substances that find their way into commercial gasolene. The chamber on the lower side of the purifier provides a means of **TRAPPING, BY GRAVITY, ALL THE WATER** in the fuel.

Water has a higher Specific Gravity than gasolene and accordingly sinks to the bottom of the chamber, forcing the fuel to float over it through the screens and filters, purified and free from everything that can cause trouble, to the carburetor. A valve is provided to drain off, at convenient intervals, the water thus trapped.

Every motorist has a vital need for an ELLIS GASOLENE PURIFIER as an insurance against carburetor trouble. Every dealer should do his utmost to have one installed on every car he sells, because the car will give its owner far greater satisfaction when insured against the most common of all motor car ills . . . . carburetor trouble.

Send for an ELLIS for your demonstrator. Its benefits will become apparent at once. Our dealer's proposition is interesting and profitable; do you want it?

BOSCH-FORD ATTACHMENT

A
Bosch Magneto
For Ignition

The
Ford Generator
For Lighting

Gives Ford Cars Maximum Efficiency

THE Bosch-Ford System has been designed to meet an urgent appeal for a more efficient and reliable ignition system, one that would eliminate preignition, overheating and the inherent difficulties and harmful effects of unsynchronized ignition.

The Bosch-Ford Attachment employs the Bosch Magneto and permits of this world renowned system being easily adapted. The average motorist can install it and requires only the tools of the usual tool kit to do so.

Every Ford owner who is interested in gaining added efficiency, and all those engaged in the sale and repair of motor cars and accessories, should investigate this proposition.

Jeffery-Dewitt SPARK PLUGS in the Making

Kiln Shed and Sizing Room. Here the cylindrical blanks of clay that come from the throwing room are graded down to uniform dimensions before being passed on to the turning department. In the middle background is shown one of the kilns sealed, ready for firing. The temperature of this kiln is raised to approximately 2700 degrees and about 72 hours elapses from the time the fires are first started until the kiln is cool enough for the porcelains to be removed.

At 75c. These Two Plugs Lead the World

The porcelain, made by secret formula and of imported ingredients, will stand up under the most severe conditions; the metal parts, case-hardened, cannot be bruised; and the electrodes, of special alloy, will withstand the current much longer and carry it far better than the old-style electrodes commonly found in plugs of this price.

The Conical Type Spark Plugs, so called because the cylinder end of the porcelain is conical in form, give excellent results. They have gained wide popularity.

The Petticoat Type, also named from the shape of the cylinder end of the porcelain, affords extra insulating surface around the central electrode. For oily motors, this plug, with the closed end, is the best plug made.

Both Conical and Petticoat types may also be had with platinum points, at 50 cents extra.

***Dealers:** Jeffery-Dewitt plugs come in many types to suit all motors. Full descriptions will be found in our free literature.*

August 30th, 1913

Dear Sir:-

It is not our policy, as a rule, to especially recommend any trade journals. We have been so much impressed, however, by the good things in "MOTOR WORLD", that we feel that it is for the "good of the service" to recommend that you subscribe for, or at least purchase it regularly.

"MOTOR WORLD" seems to take up the dealer's problems and solve them better than any other trade paper we know of

We are only sorry that we did not take this matter up with you sometime ago. Each issue is full of timely hints and helps. Its wide-awake merchandising department contains live, practical suggestions that will appeal to every MARMON dealer.

We have been particularly impressed by the "Reilley Stories" which have recently been running and feel that they are the best of their kind.

Hoping that you will accept this suggestion, if you have not been reading "MOTOR WORLD" regularly in the past, we are,

Yours very truly,

NORDYKE & MARMON COMPANY.

Digitized by Google

That publication serves the manufacturer best which helps the dealer most

MARMON'S letter hits the nail squarely on the head. "Motor World seems to take up the dealer's problems and solve them better than....."

Can any publication serve manufacturers half as advantageously as the one which best helps the men who ultimately sell their goods? If you sell direct to dealers, how better can you approach them than through the advertising pages of their favorite trade paper?

If you sell to car manufacturers, the dealer ultimately sells your goods. Can he feel that the use of your product on the cars he sells is a benefit to his customers unless you point out such benefits and educate him as to their advantages? And in so doing could you select a better medium than the one which helps him in the conduct of his business?

Whether the dealer is your customer or your customer's customer, he is the most logical link in your business chain for you to strengthen with all the selling arguments you can give him.....and Motor World's argument is just this:

That publication serves the manufacturer best which helps the dealer most.

Continental Motors

The Final Test of Fitness

With fingers delicate as those of a lacemaker, with calipers and gauges recording fractions of a thousandth part of an inch, he checks off size, shape, form—37 dimensions in all. This inspector of finished crankshafts is an autocrat whose word is final—a "Guardian of the Faith" placed in the Continental. And the crankshaft is but one of the 1292 listed parts that go into the assembly of this famous motor.

The motors you *hear* are not Continental Motors

Noise in a motor is the protest of the mechanism against the negligence of the maker. Thanks to the watchfulness of this workingman and his fellows, Continental Motors are practically noiseless. Continental carefulness lathes, grinds, polishes, measures, analyses until all the 1292 parts are so accurately fitted that they operate with the quiet purr of an electric fan.

CONTINENTAL MOTORS ★ Powerful as the Nation ★ AMERICA'S STANDARD

Over sixty leading engineers are specifying more than 40,000 Continental Motors for 1914—in order to give you what you ought to have for service and satisfaction.

Every *buyer* knows he is getting a downright *best* car or truck when it is built around the Continental Motor.

Every *dealer* can get such a car or truck by handling one of the sixty-odd established makes now using Continental, or by *specifying Continental.*

Two Dollars Makes $30

With a Cox Oxygen Carbon Cleaner you remove a spark plug in each cylinder and insert the small metal nozzle of the cleaner. Turn on the oxygen, regulate its flow by the valve, light it with a piece of burning paper or a wax taper and feed the flame around on the inside walls of the cylinders, over the valve ports, etc. The flame will reach the most remote corners and after from six to ten minutes the cylinder will be cleared of its carbon deposits and be as clean as a new silver dollar. There is not the slightest possibility of damaging the motor; this we positively guarantee.

This is the kind of money you can make if you will replace old, obsolete methods with up-to-date practice in the conduct of your garage and repair-shop.

This is the kind of profit you can make, and besides, you can do so much better work that your customers will send their friends to you to have the carbon removed from the cylinders of their cars.

And you do not have to hold up the use of their cars more than an hour at the outside.

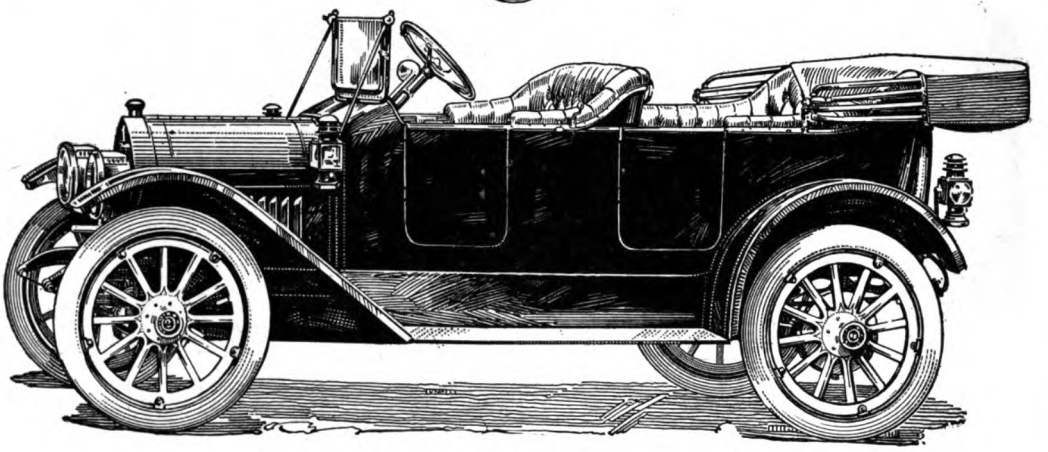
The above will give you an idea of the improved service you can give your customers, as well also the money you can make by so doing.

Here, in brief, is a summing up of the proposition, so you can see whether or not it is to your advantage to install at once a Cox Oxygen Carbon Cleaner.

Cost of apparatus complete . . . $25
Cost of Oxygen, refilling tank with oxygen, each $2

NOTE: Tanks are loaned to you and you are charged only for refills at above rates by your local distributor.

Each tank contains enough oxygen to clean properly from 35 to 40 cylinders, and the time required to do the work is from 6 to 10 minutes per cylinder. Any man, helper or boy is competent to do the work. We positively guarantee that the use of the Cox Oxygen Carbon Cleaner cannot cause the slightest harm to a cylinder or any part of it.



Write or wire for further particulars. Act at once for we are now working almost to capacity to take care of orders on hand. Be the first in your vicinity and get this work coming before someone else cuts in on it.

FEDDERS RADIATORS

FEDDERS RADIATORS won their reputation for efficiency while the automobile industry was comparatively young. In those days the radiator of an automobile had a heavier burden placed upon it than nowadays. Bearings and many other things were comparatively crude, causing a loss of energy through more or less unfavorable working conditions. One of the first results of unfavorable working conditions in a motor is premature heating. Fedders radiators, good as they were in those days, efficient under unfavorable circumstances, are as much better now as are the motors which they serve.

Now that automobiles are showing a tendency toward standardization, Fedders Radiators are becoming more popular with manufacturers. Before adopting a certain standard, manufacturers are pretty sure that part is the best that can be had. Fedders Radiators are standing the acid test.

The policy in vogue at the Fedders Works, that of co-operation between our engineers and your engineers and designers, has worked out to the advantage of all concerned. Write us about your radiator problems; the probabilities are that together we can solve them most satisfactorily.

Announcing the acquisition of THE McCUE Co *by the* HOUK MANUFACTURING Co

The HOUK WHEEL

As announced through the press of the country last week, control of The McCue Company was sold to Mr. George W. Houk, of Philadelphia, and reorganized and refinanced under the name of the Houk Manufacturing Company. Aside from the entrance into the company of Mr. Houk, this reorganization brings about no change in the personnel of the old company either as to its holdings or its operating management. What it does bring to the company which is of greatest import to the consumer of wire wheels is the right to all of the Rudge-Whitworth patents and particularly those covering triple-spoke lacing and the one positive automatic locking device for detachable wheels on the market.

Digitized by Google

TO PRODUCE A WIRE WHEEL that can be commercially guaranteed without using methods and devices covered by these two particular patents is impossible, and it was a firm realization of this fact, after months of research, investigation and development, that brought about this change. The Houk wheel (as the product will be known hereafter), is simply a refinement and development of the old McCue product, so improved and refined principally by the use of these Rudge-Whitworth features. That the company was faithful in its determination to market only such product as inevitably must live up to the wide claims of superiority possessed by a wire wheel of proper construction, is indelibly shown in the fact that the original organizers thereof were willing to give up control in order to become possessed of the rights to manufacture under the only methods known that insure a dependable and efficient wire wheel.

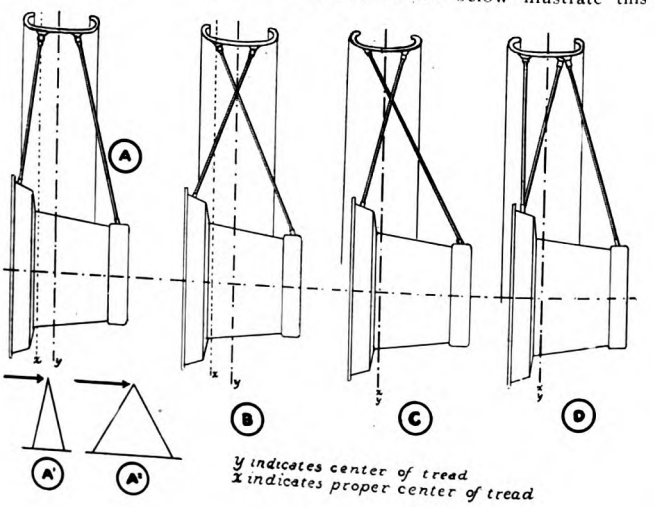
Patents

When the present management assumed charge it was soon realized that, without these rights, their product would be a makeshift, and then, convinced that such rights could emanate legally only from Mr. Houk, negotiations were straightway put under way that consummated in the organization of the Houk Manufacturing Company—which is entirely separate and apart in every detail, both as to holdings and manufacturing, from the Rudge-Whitworth proposition which Mr. Houk maintains in Philadelphia.

The volume of wire wheel business recently placed by a number of the leading automobile manufacturers is remarkable, considering the comparatively recent acceptance of the wire wheel by the buying public in this country, and a large part of this business being tentative upon the clearing of the situation, both as regards volume and infringement, the plans consummated last week were obviously logical to a large continuance of the wire wheel industry.

Construction

All of which brings us to a discussion of what is **the most important phase of wire wheel construction today, the value of triple spoke lacing,** and of the use of a positive, automatic locking device.



Besides supporting the weight of a car or sustaining the radial load, in operation, a wheel performs two other very important functions.

First, it propels the car by transmitting the driving torque from the axle to the road surface. Second, it withstands thrusts when the line of driving is changed or when side sway occurs which is due to driving over ruts or from skidding.

TRIPLE-SPOKE LACING

It is the fact that it is necessary for a wheel to be able to withstand these radically different and varying loads that presented the biggest problem to the construction of wire wheels—which problem has been solved by resorting to triple spoke lacing.

The four diagrams shown below illustrate this

Digitized by Google

point perfectly and simply—for after all the problem is really a very simple one.

Development

In sketch "A" we show the first method of wire wheel construction, which was discarded years ago as inefficient. In this double spoke lacing it will be noticed that the angle at the points of contact of spokes and hub and spokes and rim are very broad. Note below figures A-1 and A-2, if pressure be applied at the peak of the pyramid, as indicated by the arrow, it is obvious that A-2 will withstand a much greater strain than A-1.

A-1 indicates the construction as it existed in double spoke lacing, while A-2 indicates the construction as it should exist.

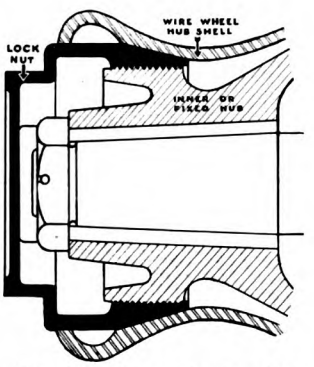
Of course, the angles of these spokes in this construction could be sharpened by bringing the spokes closer together at the rim, but by adopting this method the spokes would be brought so close together in the rim as to weaken the holding capacity of the metal in the rim and threaten its stability.

The spokes must be a certain fixed distance apart in the rim, and the acceptance of this fact was largely responsible for the troubles encountered.

In an attempt to overcome this difficulty, spokes have been crossed as indicated in B. This crossing of the spokes may give the desired angularity to withstand thrusts but if the angles are maintained any wise equal to provide the desired equal strength in either direction, the tread cannot be brought to maintain the same position as in wooden spoke practice. To offset the rim in respect to the center of the hub in order to maintain the same tread as employed in wooden wheel practice, resort has been made to unequal angularity of the two sets of spokes and even to an unequal number of spokes in the two sets, in the attempt to keep them in mechanical balance, as indicated in figure C.

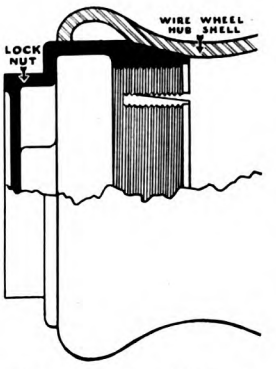
Impractical Under Stress

Suppose it is granted that a statically staple wheel may be designed after this manner, yet when subjected to continued driving, radial load carrying and side thrusts, it has been found by experience that a sacrifice of strength in one way or another is inevitable.



Successful Design

The failure of these methods finally resulted in the perfecting of the triple spoke lacing, as indicated in figure D. In this construction the spokes which are laced at an angle carry the side thrusts, while the circle of spokes which are laced at right angles to the driving line are relieved of all stress due to side thrust and, while carrying their proportion of the radial load, are designed especially to transmit the torsional strains of driving.



Strength

This admits of a maintenance of the tread just the same as in the wooden wheel and at the same time gives proper angularity to the thrust carrying spokes to enable the wheel as an assembled unit to possess practically fifteen times the thrust carrying capacity of a wooden wheel and practically five times the radial and driving capacity of the wooden wheel.

The facts in the case are all provable, both mathematically and by test, and if anybody is interested in the figures necessary to prove our statements, beyond a doubt, our engineering department will be very glad to go into details covering the question.

This shows inner and outer hubs locked in place.

This shows outer hub and lock nut off the axle.

Sectional drawings of the new **HOUK WIRE WHEEL HUB**, showing the **AUTOMATIC LOCK NUT**. Should this nut be left slack the pressure of the wheel hub shell on the nut clamps the nut between itself and the threaded hub on the line contact, setting up a differential creeping action, which forces the nut to lag behind and so to tighten itself on the wheel. When the nut is tight, obviously the creeping action ceases.

LOCKING DEVICE

One of the most essential features in the application of detachable wheels to motor cars is that they be easily and quickly removed, and at the same time that they be held in position by simple, positive means—not complicated by the so-called locking devices or fixings that depend upon springs, pins, or any other extra parts which have to be fitted in position, in order to prevent the member holding or clamping the parts from coming loose. All such devices are not only complicated and trappy by nature, but in the end depend upon human agency and intelligence to see every time that they are fixed properly in place.

Digitized by Google

IN the Houk wheel all such locking means have been discarded in favor of a positive single piece clamp nut, completely automatic and self-tightening whenever the car is in motion, and consequently, by virtue of this maximum of simplicity and automatic self-tightening, it is positively fool-proof, no matter under what condition used.

SIMPLICITY

Both the principle of the operation as well as the device itself are so simple and obvious, that, when once understood, the absolute simplicity of the entire construction is the greatest guarantee both of its effectiveness and of its safety.

First, of course, there is a primary or inner hub which contains the bearings, and upon which the hub shell of the wire wheel has to be mounted. Obviously, the most simple means of holding this in place is by a single nut screwed on to the end of the fixed hub member, and thereby clamping the wire wheel in position; but, such a nut is liable to come off. Here is just where the trick is turned by the perfection of the design and the application of this patented device so as to perform this dual function of clamping the two parts together and at the same time being automatic and self-tightening in co-operation with the parts with which it is in contact.

DETAILS OF LOCKING DEVICE

The lock nut is a ring, threaded internally, to engage the threads on the fixed hub, and, on the outside, tapering to clamp and hold the wheel hub shell in correct rigid position. The nut rings are threaded for a loose running fit, and have their conical ends slotted into segments, allowing a slight compression when forced into the conical seat of the hub shell. They, therefore, have a loose running fit on the hubs until finally forced into position. By virtue of the fact that the nuts are threaded loosely there is a slight difference in the diameters, and a consequent greater difference in circumferential length of the threads. Thus, should the nut not be drawn up tight, through either neglect or intention, the wheel supporting the weight of car would bear upon the nut and hence upon the threaded hub in theoretical line contact. As the wheel and hub turns when the car rolls forward, the nut also turns, but only as it is carried forward by the line of contact. The threads, wedging together under the pressure of the load, after the manner of a cone clutch, prevent slippage between the threads and, therefore, force the nut to lag behind the angular travel of the hub parts and consequently to screw itself on to the threads when they are properly positioned on the car—that is to say, on the right hand side of the car the hubs are provided with left hand threads, while on the left hand side of the car the hubs have right hand threads.

On the other hand, when the nuts are once in place, there can be no creeping action, as there is no difference in diameter or peripheral length, and they therefore clamp together in the conical end of the hub. Experience and repeated trial has demonstrated that if a nut is inadvertently left loose, the rolling of the car for only a short distance will suffice to tighten it. On the other hand, when the nut is brought home and this differential creeping action ceases, no amount of backing up would suffice to loosen it.

To the Trade

While announcing a greatly strengthened organization and improved manufacturing facilities, we do not want you to lose sight of the fact for a single instant that wire wheels always provide a greater factor of safety and relieve owners of a good portion of their tire expense. Write us for all particulars regarding wire wheels you may desire.

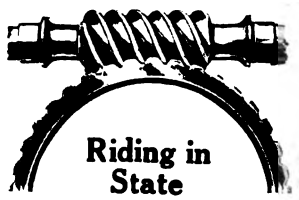
"American" Axles

Combine in a Perfect Mounting the Finest Type of Worm Drive with a Full-Floating Axle of the Highest Grade

More fortunate than the early users of the worm drive abroad, motor car builders in America can utilize in a complete form the finest known type of this gear, in an axle of equally assured quality.

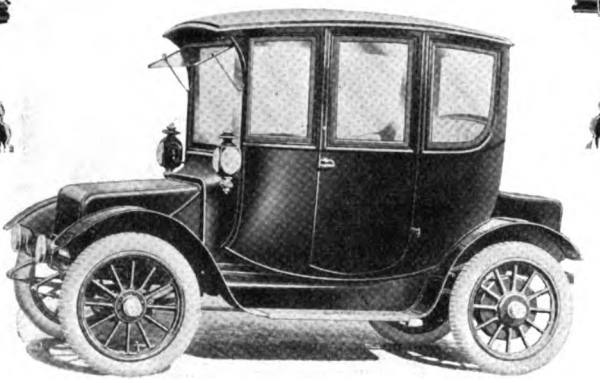
The Lanchester-Daimler Worm Drive, mounted in a full-floating "American" Axle, fitted with the best of foreign made ball-bearings, constitutes the last word in design, material and workmanship as known to the motor car axle industry today.



We do not think that there can be any dispute as to the individual superiority of each of the factors named. They are to be found—in their combined form—in "American" Axles only, and they are offered with entire confidence, for use in either gasoline or electric pleasure cars of the highest grade.

It is not necessary to say more for this axle than that it is, in every way, the equal of our "American" Bevel Drive Axle, which, wherever found, indicates a car of exceptional quality.

The adjusting and full-floating features of American Axles are fully covered by our own patents and by shop rights from other patentees.



THE AMERICAN BALL-BEARING COMPANY, Cleveland, Ohio

Riding in State

No royal coach builder ever lavished more infinite care and pains on a monarch's equipage. A standard developed through sixty years of unceasing endeavor has given Rauch & Lang Electrics an unchallenged prestige that commends them to those of ultra discernment. It is a matter of "not how many, but how good." Naturally our production is limited.

Three Types of Control

For All Driving Necessities

Front Control — Rear Control — Combination Control. The latter type is interlocking — also brakes. Protection against meddling from person seated in rear while car is being operated from front, and vice versa. The Rauch & Lang Control System is the most wonderful protective item in the Electric Vehicle World.

The Climax in Electric Car Construction

The New Rauch & Lang Worm Drive

Rauch & Lang leadership in the making of electrics is again emphasized in the adoption of the Worm Drive—the greatest single advancement in the history of the electric car.

As utmost beauty and refinement have always distinguished Rauch & Lang Electrics, so does the worm drive mark their continued supremacy in respect to method of propulsion. It excels the advantage of the double chain over the single—of the bevel gear shaft over the double chain. It is the engineering world's latest and greatest offering in perfect driving mechanism. It means utter simplicity in driving, greatest power economy, greater all 'round efficiency, better riding and coasting qualities, no adjustments, no misalignment, ***and lower upkeep cost.*** Its silence is soothing. The worm drive is the only practical direct drive in electrics, and the Rauch & Lang Straight Type Worm Drive is superior to all others.

Any Rauch & Lang Agent will gladly demonstrate. Catalog mailed on request.

SHELDON DOUBLE-BRAKE REAR WHEEL EQUIPMENT

When You Take the Brakes off The Jack-shaft, You Make a Big Step Forward in Motor Truck Progress

The wheels are the safest place for the brakes—they are the proper place.

A jack-shaft brake is never any stronger than the chain. If the chain breaks or jumps the sprocket the truck is practically helpless.

The superiority of Sheldon Double-Brakes-on-the-Rear-Wheels over the jack-shaft design is never questioned by engineers who have looked closely into the matter. Those engineers who have the courage of their investigations **insist** that the wheels are the only logical position for the brakes. Sheldon has solved the problem.

In the first place, there is complete freedom from chain, jack-shaft and axle strain. Then, too, there are a minimum number of parts subjected to strain—therefore, they stand abnormal shocks with greater safety.

You can't always depend on a jack-shaft brake skidding the wheels. Sheldon 3-ton brakes will skid the wheels with a 4½-ton load on a 30% grade EVERY TIME.

Sheldon Double-Brakes-Rear-Wheel-Equipment is the most scientific and effective brake equipment on the market.

If you are interested—write us and we will send you complete information.

Experience Six-Cylinder Smoothness in Your Four

---But This Is The Only Way You Can Get It

ED your Four up to 30 miles an hour or more on a smooth road. Then throw t the clutch and close the throttle.

ast down a long smooth hill with the motor running idle.

eeling is that of flying. There is no vibration. In this particular the sensation ing in a Four approaches that felt in a Six.

in a Six, the smoothness is ALWAYS there. e like constant coasting. In the HUDSON Six ill and down, on rough roads or smooth, fast , the feeling is always the same.
our—no matter how powerful or through what ition of gears its power is transmitted—can be ride so smoothly.
take a drive in the HUDSON Six 54.
enjoy driving, take hold of the wheel and feel rself the full meaning of that much-talked-about ness and flexibility of the Six."
other will it have such a meaning for you.

Try coasting with your Four on a run of 100 feet.

Then come, see us, we'll show you how to do it for 300 miles, all day, without fatigue. It must be in a HUDSON Six 54.

New Features in HUDSON Six 54

True streamline body—the handsomest car you ever saw. Highest standard of HUDSON design and construction. The very best we know in beauty and finish. Left side drive. Right hand control. Entrance to driver's seat from either side. Electrically self-cranked and electric lighted.

cept Howard E. Coffin's 1914 Automobile Review---We'll Send It!

tomobile buyer should fail to read Mr. Coffin's bile Review.
lows why six cylinder cars are now so popular. xplains the reasons for their smoothness, and y are so desirable. With diagrams, and in the language he makes you understand why so akers are now manufacturing sixes exclusively. lls about left side drive and right side drive— asoline economy—electric and other gear shifts nline bodies—speedometer drive—new things in . and other features embodied in the 1914

an is more eminently qualified to prepare such w. Mr. Coffin's reputation as an engineer, and his many contributions to the progress of the automobile industry both as a designer of many successful cars, and a contributor to engineering literature make his review authentic.

Of course he refers to the HUDSON Six 54. No discussion of automobile tendencies would be complete that omitted mention of this new car.

Can you afford to consider the purchase of any car costing $1,500 and over without knowing what such an authority as Mr. Coffin has to say upon the subject.

Send your name and address. (273)

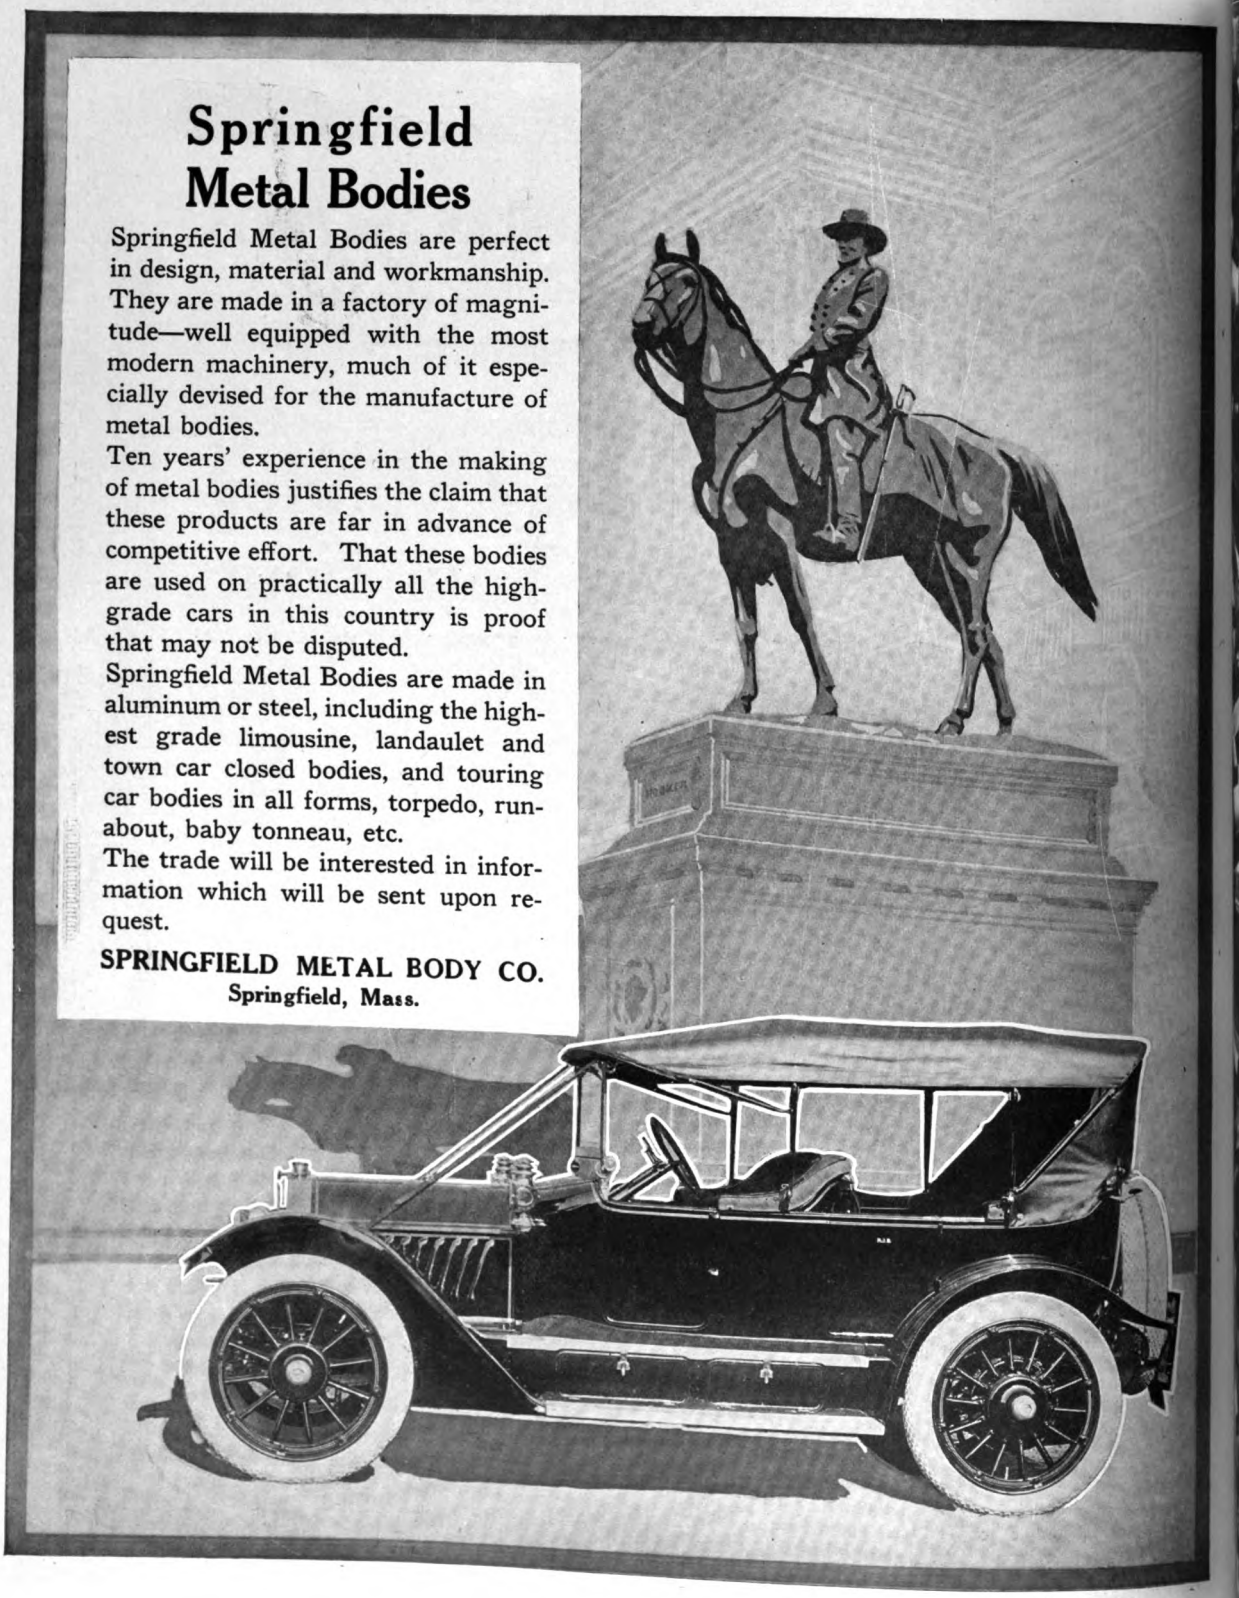
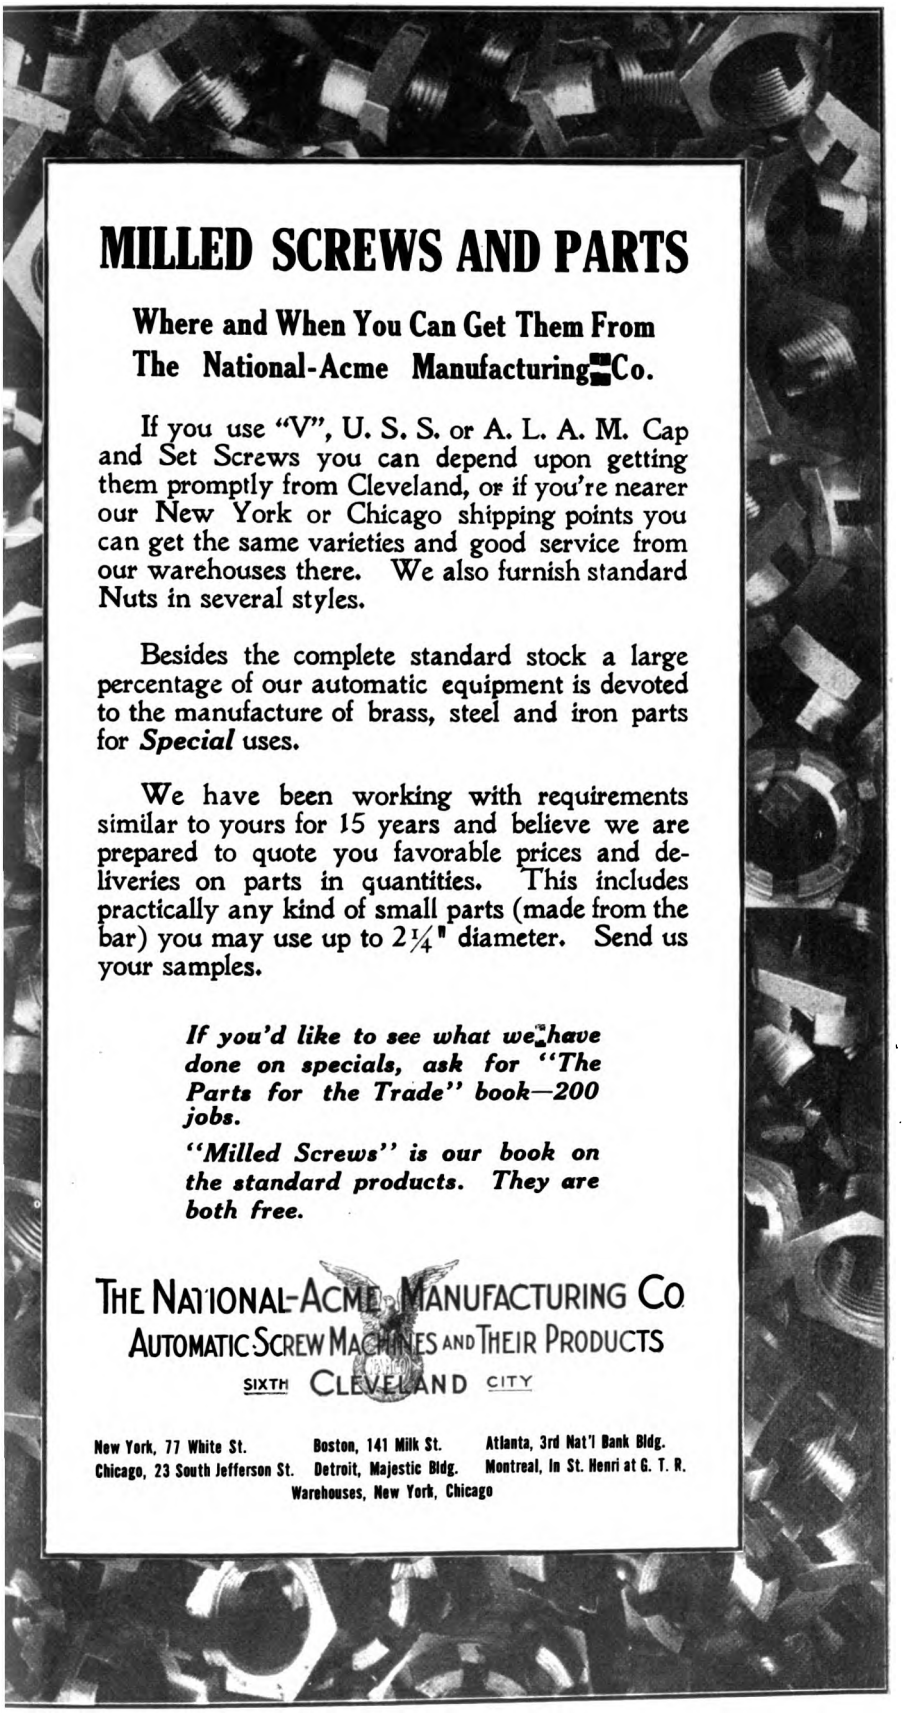
Springfield Metal Bodies



Springfield Metal Bodies are perfect in design, material and workmanship. They are made in a factory of magnitude—well equipped with the most modern machinery, much of it especially devised for the manufacture of metal bodies.

Ten years' experience in the making of metal bodies justifies the claim that these products are far in advance of competitive effort. That these bodies are used on practically all the high-grade cars in this country is proof that may not be disputed.



Springfield Metal Bodies are made in aluminum or steel, including the highest grade limousine, landaulet and town car closed bodies, and touring car bodies in all forms, torpedo, runabout, baby tonneau, etc.

The trade will be interested in information which will be sent upon request.

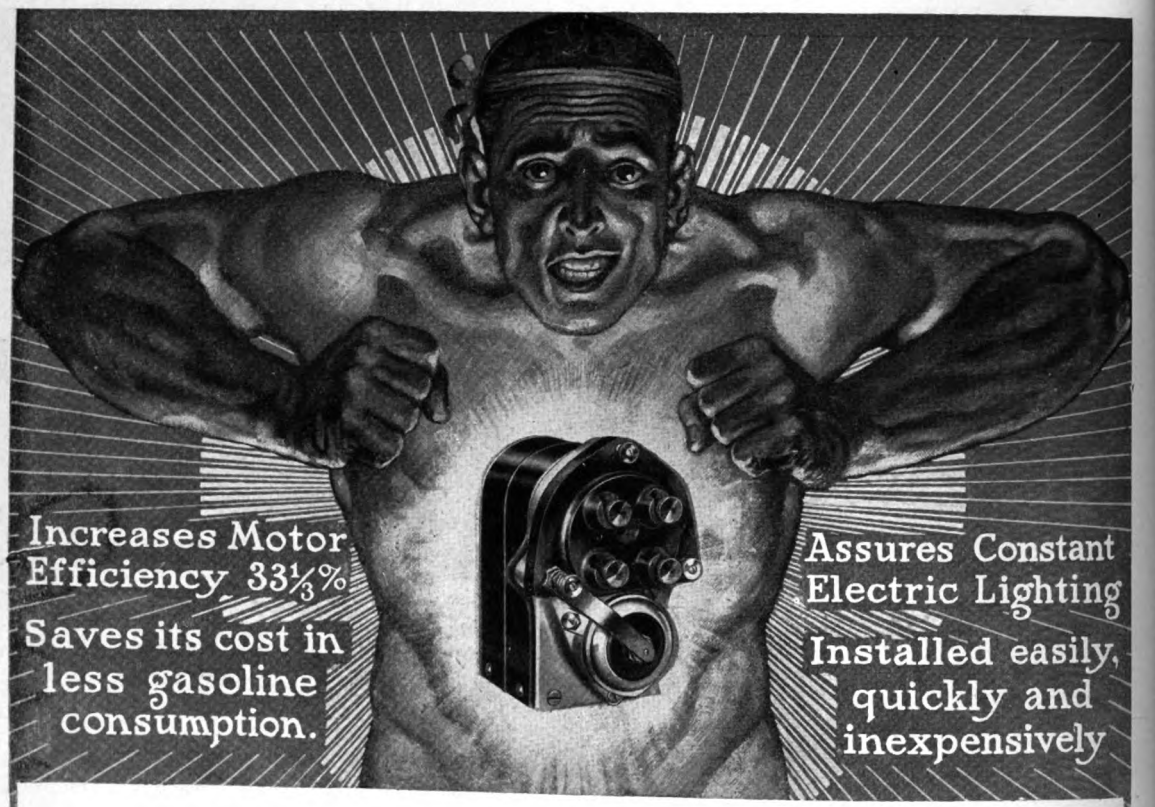
MILLED SCREWS AND PARTS

Where and When You Can Get Them From The National-Acme Manufacturing Co.

If you use "V", U. S. S. or A. L. A. M. Cap and Set Screws you can depend upon getting them promptly from Cleveland, or if you're nearer our New York or Chicago shipping points you can get the same varieties and good service from our warehouses there. We also furnish standard Nuts in several styles.

Besides the complete standard stock a large percentage of our automatic equipment is devoted to the manufacture of brass, steel and iron parts for ***Special*** uses.

We have been working with requirements similar to yours for 15 years and believe we are prepared to quote you favorable prices and deliveries on parts in quantities. This includes practically any kind of small parts (made from the bar) you may use up to 2¼" diameter. Send us your samples.



If you'd like to see what we have done on specials, ask for "The Parts for the Trade" book—200 jobs.

"Milled Screws" is our book on the standard products. They are both free.

SPLITDORF "FORD SPECIAL"

WATERPROOF HIGH-TENSION MAGNETO

The SPLITDORF ELECTRICAL CO. has harkened to the insistent demands of Ford owners and agents and has produced a thoroughly-tested high-tension magneto that promises to revolutionize the running of these remarkable cars.

Waterproof, and enclosed-gear driven, the Splitdorf "Ford Special" High-Tension Magneto is of special construction to meet the demands of Ford cars. With its installation the nuisance and expense of vibrators, coils and batteries pass away and a high-tension system secured that is second to none.

ore than one_____car in competition much higher price, because it was an Auto-Lite Electric Generator."

"Current to Burn"

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

"G" or is eto e

THE star salesmen of one of the well known automobile concerns made this statement last week in our office. He went on to say—

"The Auto-Lite Electric Generator has given such satisfactory service on_____cars, that I have actually marveled at its ability to keep running day and night without any more attention than I have given the radiator or tires.

I have driven a demonstrator equipped with an Auto-Lite System all over the country, through rain storms, over the roughest kind of roads, and I have yet to find the first fault with it.

The lights are always bright—ready when I want them.

The control is perfect, which is something you can't say about the others.

The Auto-Lite is unquestionably the best electric lighting system on the market today."

These statements were made by a man with long experience in the motor car business.

He travels continuously, is personally acquainted with all of the well-known automobile agents east of the Mississippi River.

Therefore, he is thoroughly posted and knows whereof he speaks.

Route of the proposed Lincoln Highway. From Indianapolis to Chicago the Indiana-Made cars took the most direct route, thence to the Pacific Coast the cars making the Indiana-Pacific Tour followed as nearly as may be the route of the proposed Lincoln Highway, shown on the map. On this tour eleven of the nineteen cars were equipped with Eisemann Ignition. Performance of Eisemann Ignition detailed below.

EISEMANN

While the Indiana-Pacific Tour was planned originally to boost Indiana-made goods and to awaken interest in the proposed Lincoln Highway, it unconsciously served another purpose, that of demonstrating, beyond the shadow of a doubt, the efficiency and reliability of Eisemann Ignition under the most adverse conditions as well as under the most favorable conditions.

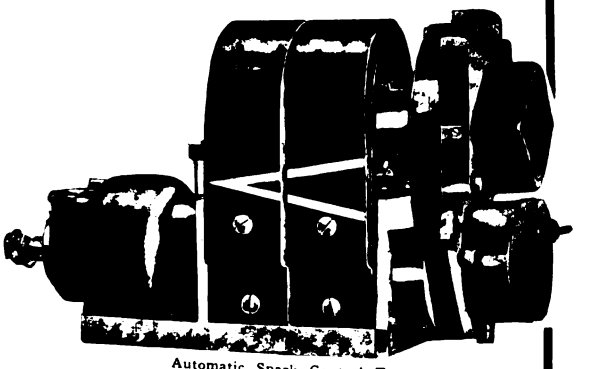
CONFIDENCE . . . Eleven of the nineteen cars making the trip decided to depend upon Eisemann Ignition.

THE TEST. . . . The tour led across prairies, over foothills and mountains, through well watered valleys, over bleak and barren passes and across miles of arid alkali deserts at constantly varying conditions of altitude and temperature. Water, dust, heat and cold, rough or smooth going did not affect the steady performance of the Eisemann Systems.

VINDICATION and a MORAL

Eleven drivers advised us that their particular Eisemann Ignition did not miss a shot for the entire distance, no trouble at any stage of the journey, absolute reliability regardless of conditions. The confidence of the car makers in Eisemann was vindicated.

This is the most severe test of ignition efficiency ever attempted and Eisemann performance in the test should point the way to other manufacturers, dealers and car buyers in any part of the country.



We will gladly send you more particulars at any time.

RAYFIELD CARBURETORS

Mr. Motorist—

If you **wanted** to economize, i. e., get the **utmost distance out of every gallon of gasoline** and some **one** carburetor accomplished it, you naturally would be interested in **that** particular carburetor.

If you **demanded** the ultimate in flexibility—the ability to make a speed record or to slow down to less than a walk—and some **one** carburetor did it, and did it easily and unfailingly, you would of course seek **that** carburetor.

If you required a carburetor which performs properly in every sort of climate, temperature and widely varying altitudes and some one carburetor was pre-eminent in those crucial accomplishments, you would, if wise, equip your car with **that** carburetor.

If you **knew** that the **Rayfield** carburetor had positively established the **record for economy** for all uses, kinds and sizes of cars;

If you **believed** that the Rayfield had **won more speed contests than all other carburetors combined** and that **every Rayfield** user can crawl along at a snail's pace if he wants to;

If you were **convinced** that the Rayfield could climb from the torrid valley to the zero snow capped mountain trail without a miss, you would discard your present erratic, limited and extravagant carburetor and install **a Rayfield.**

The Rayfield is the **one carburetor that does all these things, perfectly** and **continuously.**

A veritable army of drivers have found it out—that's why the Rayfield is the big carburetor success today.

Try one—we'll take it back within 30 days —if it doesn't make good.

ANNOUNCING THE IMPROVED SERIES T

A BIGGER car, but no heavier. A better car, but no higher in price. There is more room in the tonneau on all models. All seats are wider: Cushions are deeper. The Radiator is larger and higher. The lines of the entire car have a much more generous, a much richer appearance than ever before. The stream line effect of the body and hood is beautiful. The air tank for the starting system is larger, so the starter will turn the motor longer and faster. The motor was nearly perfect, but room for a few refinements was found even in it. The rear axle has been refined and is even better than formerly. The air pump for the starting system is all metal and is oiled automatically. Every feature on the car is better than ever before, but even so, few radical changes have been made.

LEFT HAND DRIVE RIGHT HAND CONTROL SLOPING HOOD NO BREAK AT DASH

Two, four, five, six and seven passenger open models **$2,590**

Four passenger Coupe, $3,300 **Seven passenger Limousine, $4,000**

Some Features

MOTOR: Six cylinders, cast enbloc, 4″ x 6″. T head.

SELF STARTER: McFarlan Pneumatic. An absolutely positive motor starter. Fool proof. Entire system weighs but 38 pounds. Spins motor FAST. Pressure supplied by all metal pump.

TIRE INFLATOR: Four cylinder, engine driven pump. All metal.

ELECTRIC LIGHTS: From engine driven dynamo which runs at crankshaft speed.

REAR SPRINGS: ¾ Elliptic, Underslung. 56″ long.
FRONT SPRINGS: 42″ long.

REAR AXLE: Full floating. Very large shafts.

EQUIPMENT: Absolutely complete as shown except extra tires.

FRONT AXLE: Has ball bearing steering knuckles.

GASOLINE SUPPLY: From Cylindrical seamless steel tank on rear of frame. 22 gallons capacity.

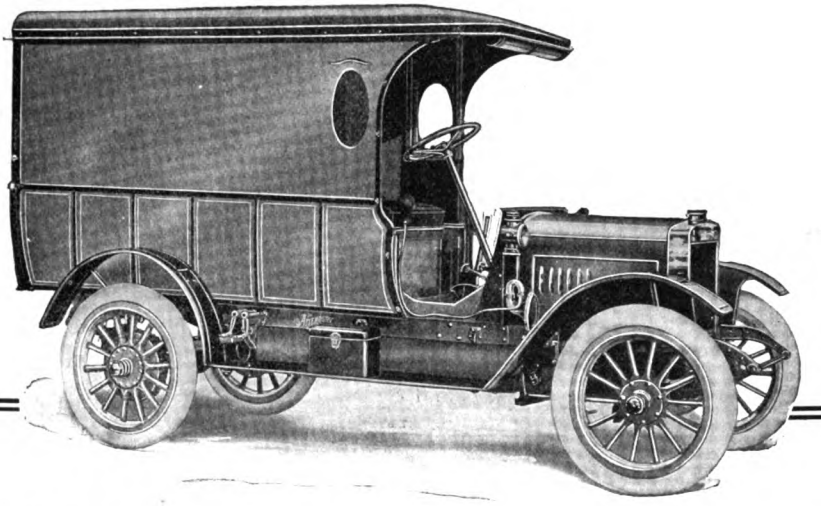
TONNEAU ROOM: 40″ from front of back seat to back of front seat in six and seven passenger models. 43″ in Limousine.

TRUFFAULT-HARTFORD SHOCK ABSORBERS.

WHEELBASE: 128″.

TIRES: 36 x 4½″. Firestone rims.

CUSHIONS: 11″ thick. Very light, open bottom, sanitary type. Built to last.



The big new catalogue is ready for you. Address Desk C

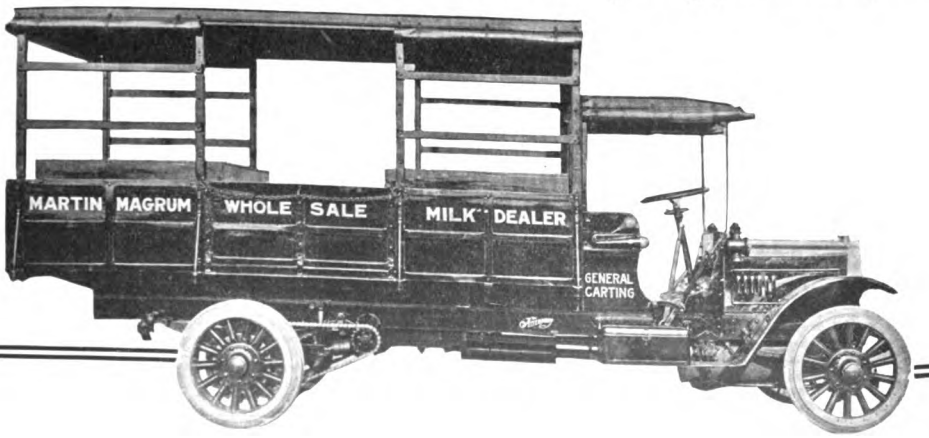
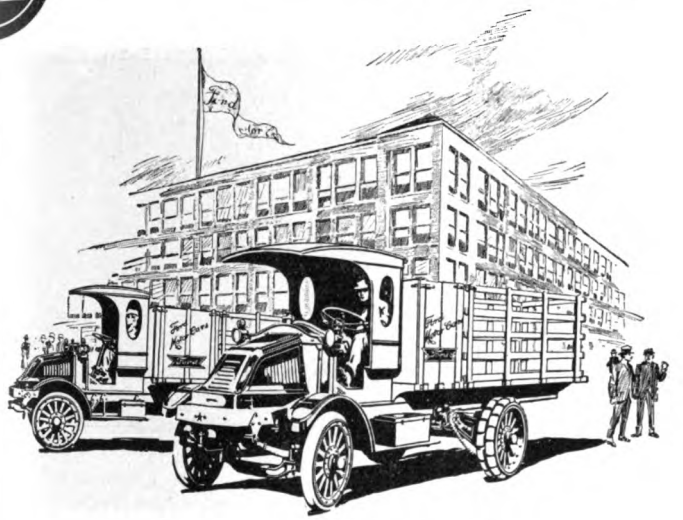
THE ATTERBURY LINE



ATTERBURY TRUCKS are built by a concern which has no other line of activity to distract its attention from the production of a line of trucks ranging in capacity from 1,500 pounds to 5 tons. Not only does the Atterbury Company confine its attention to the production of motor trucks but it has done so for ten years. During that time our annual output of trucks has increased from few to a large number, our increased production has enabled us to take on more dealers and to extend the scope of our operations from a purely local business to one assuming national proportions, and, what is better from every standpoint, Atterbury Trucks are giving good satisfaction in whatever line of trade they are used.



There are but very few truck makers who can point to the unbroken record of success the Atterbury Company has to its credit. There are few makes of trucks that have shown the steady development that Atterbury Trucks show, and when met in competition, there are no trucks more adaptable to hauling problems than Atterbury Trucks.

These are some points for the man to consider who contemplates going into the truck sales business. It is a business that must be done on strict commercial principles, a business where nothing counts quite as much as consistency and merit, and considered from the standpoint of consistency and merit, Atterbury Trucks offer the strongest nucleus that can be found in any American made truck today. Write for the Atterbury dealers' proposition.

The Atterbury Motor Car Company, Buffalo, N. Y.

"Two Years Ahead"—

This is the opinion of a prominent official of the Ford Motor Company after he had examined carefully the Kelly water-cooled models.

As a result, the Ford Company purchased two three-ton Kellys—making a total of four Kellys now in use at the Detroit plant. These purchases were made after carefully looking over every truck of national repute.

The Dayton Engineering Laboratories Company (Delco) just bought a three-ton Kelly for its Dayton factory.

These companies know the best truck when they see it. Do you?

DEALERS!
There is still some desirable Kelly territory open. Write for our agency proposition.

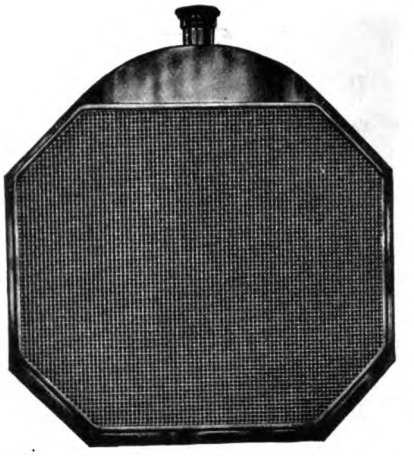
12 Years

Standing between you and our guarantee of quality and performance is an experience and study of 12 long years spent in developing and perfecting a *real service giving spark plug.*

The result of that period of pioneering

A plug which cleans itself, which burns the carbon as fast as it forms—a plug which doesn't require frequent replacement and which, under ordinary conditions, should last as long as your engine—the C. A. Mezger



"Soot Proof"

Soot Proof Spark Plugs are controlled by basic patents which make successful imitation impossible. Built with a double chamber. Therefore they offer three times the resistance of any other spark plug made.

Millions in use today on the best built cars in America, some of them after 8 years' continuous service.

On a basis of repeat orders alone you should stock Soot Proof Plugs—to say nothing of the satisfied customers you will make by pushing Soot Proof Plugs as your leader.

C. A. MEZGER, Inc
15 Canal Place
New York

Our departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.

We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.

Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky, inefficient radiator and a "superheated" customer, then be sure this car was not equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

Good Cable Essential

In the early days, when only an ignition system existed, and particularly when automobiles were not rated for their reliability a poor quality of cable might have answered.

If a cable gave out in those days only a few minutes' time was required to take out the old cable and replace it with new cable.

Since the advent of electric lighting and starting devices and electric gear shifts high quality cable is essential to get 100 per cent efficiency.

It is practically out of the question to expect a car owner to be familiar with every part of his elec trical system.

Packard CABLE

The car maker as well as the starting and lighting manufacturers owe it to themselves and their customers to use the best cable they can buy to make the wiring permanent and effective.

Packard high quality cable alone meets all of the exacting requirements. Every foot of Packard cable is submitted to rigid tests which eliminate all danger of ever getting a piece of defective cable. It costs a little more because it lasts longer and always makes good.

This Hanger Free

A 16x20 six color reproduction of the Packard Girl painting by Liebscher will be sent you with your initial order. Samples of cable and prices on request.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

A Mercury Switch Does It!

Benjamin F. Bailey, the eminent electrical engineer, has made it possible at last for the purchaser to secure a high grade starting, lighting and ignition system on a medium priced car—a system in which all troublesome devices, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points have been eliminated. A patented mercury switch does it.

There are no moving parts in its system of regulation.

The outfit is high-grade in every respect, and it is much superior to that offered by most cars selling for twice as much. Our Book "Bailey Electric Systems and Electric Lighting Explained" will be of great interest to you. It gives details and prices.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to ***prevent*** accidents.

"I can't afford to take ***any chances.*** We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of ***Weed Chains*** and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—***Life Insurance*** and ***Accident Insurance Companies*** strongly endorse them and recommend their use. ***Taxicab Companies,*** for their own protection, ***insist*** that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

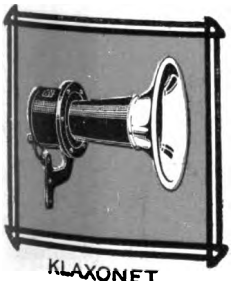
When you buy a car
ask about the Warning Signal

IF the salesman says "Klaxon" you will know something about the car.

You will know that the car maker has not spared expense to give you the BEST he can buy from radiator to tail-light.

You will know that he is paying from two to eight times as much for the Klaxon as he would have to pay for a cheap unknown "electric horn."

If he equips with the highest priced warning signal, he will not skimp on motor, transmission, axles



IF the salesman says "electric horn" or "just like the Klaxon," ask him what kind of horn. In nine cases out of ten, HE WON'T KNOW.

You will know something about THAT car. The maker is supplying an inferior, unknown accessory, where, from a standpoint of safety alone, he should supply the best—just as he should supply the best brakes.

That car is built around a price. Safety and quality are secondary.

These cars are Klaxonized

Studebaker

$1550 Studebaker "SIX"

THERE are comparatively few business houses in the United States that can point to an uninterrupted business career of more than half a century, —and, in addition, possess unlimited financial resources, and a world-wide reputation for integrity and the "square deal."

Stability, financial responsibility, integrity—are but a few of the reasons that make automobile dealers anxious to sell Studebaker cars. They have confidence in Studebaker and in Studebaker Service.

The confidence is felt by car purchasers as well as by the men who sell cars. That is why Studebaker cars are easy to sell. And—having sold a car—Dealer and Purchaser know that every aid and co-operation will be given by Studebaker to keep both Dealer and Purchaser satisfied.

Have You Tried the New Automatic Truffault-Hartford Shock Absorber?

It is the greatest improvement in shock absorbers in four years and is offered by Mr. E. V. Hartford, who designed the original Truffault-Hartford and who is now responsible for the perfection of this New Automatic Truffault-Hartford—absolutely the highest type of shock absorber in the world.

Equipped with this device, your car recognizes no difference between the roughest stretch of cross-country road and the smoothest boulevard. All roads are smooth roads in the truest sense. Cobblestones and wretched thoroughfares are ridden over as easily and luxuriously as the Pullman coach rides on a rock-ballasted railway. Your motoring comfort is *complete*.

The New Automatic is a broader application of the time-proven principle of frictional absorption upon which the famous Truffault-Hartford has always been built. It has three frictional tensions instead of one.

The first of these, while very slight, serves to absorb the noticeable vibration of the car on smooth roads. It is an effective safeguard against crystallization of steering knuckles, etc.

When the road assumes moderate roughness the tension is automatically doubled and this second degree holds the spring in check without interfering with its normal up and down movement.

A third tensional degree, offering still greater resistance, is provided to nullify the damaging jolts and jars on crossing car tracks, culverts, road ruts, etc. The spring is thus prevented from excessive action under the stress of even the roughest going.

All tensions respond immediately to the varying road conditions, and the tensions are easily adjusted to the proper intensity on every type of spring—the stiffest as well as the most flexible. There is no other shock absorber that can compare with the

New Automatic
Truffault-Hartford
SHOCK ABSORBER

for efficient, lasting service on all cars of heavy build. See the New Automatic on exhibition in any one of our Branches, or ask your dealer for a road demonstration of this device. $60 per set of four. Other Truffault-Hartfords $50, $40, $25, $15. Full descriptive pamphlet will be sent on your request.

R. I. V. equipped cars provide the dealer with a strong selling argument, the value of which he is well aware. R. I. V. Imported Ball Bearings are often the factor that determines a sale.

Enterprising dealers are prone to claim these QUALITY bearings are used in their cars. They know the efficiency and durability of R. I. V. are undisputed and that discriminating motorists consider them a necessity to the guarantee of a silent and continuously satisfactorily running car.

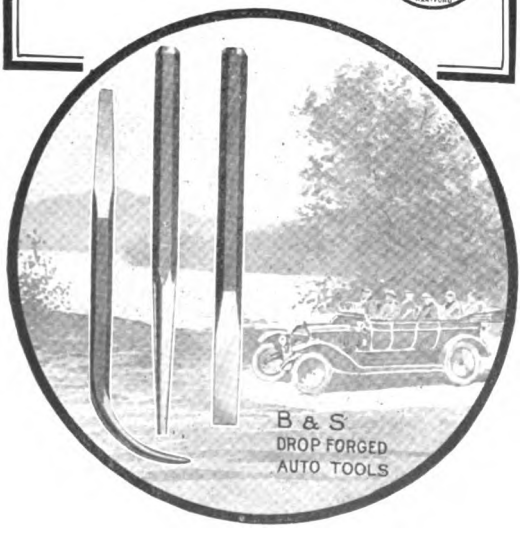
IN the progress of man to the advanced methods of today, all has depended on improvement in quality and efficiency of manual tools. Best representative of modern tool standards are unquestionably



Billings & Spencer Tools

"The tools that are guaranteed"

The reason is in the fact that their advanced features of construction provide the utmost in efficiency, convenience, ease of action and durability.

MOTOR WORLD

Vol. XXXVII New York, U. S. A., Thursday, October 9, 1913 No. 3

KLAXON TAKES NEW TACK IN LAWSUIT AGAINST SPARTON

Lovell Claims $24,000 "Reward" for "Discovering" Sparton's Alleged Misuse of Word "Patented"—Three Other Suits Filed.

Without awaiting the outcome of the several suits which have been instituted against supply houses handling Sparton horns, and automobile dealers selling cars equipped with that device, the Lovell-McConnell Mfg. Co., of Newark, N. J., has carried the war directly to the Sparton makers, the Sparks-Withington Co., of Jackson, Mich.

In doing so, the Lovell-McConnell people have not only filed suit for alleged infringement of their several patents, but have struck out in a wholly new and unexpected direction by seeking the reward offered by Federal statute No. 4901, covering the use of the word "patented" on articles on which a patent has not been granted.

This particular action is brought by F. Hallett Lovell, Jr., president of the Lovell-McConnell company, who seeks to recover $24,100 for his services in locating 142 violations of the offense by the Sparks-Withington Co., the violations, of course, consisting of imprinting the word "patented" on Sparton horns on which it is asserted no patent has been granted.

The Federal statute in question imposes a penalty of not less than $100 for each violation of the sort, one-half of the penalty to be paid the person who shall sue for it.

In addition to this action, and two suits for infringement of patents, the Lovell-McConnell company has brought a fourth action charging the Sparks-Withington Co. with unfair competition, in that it is alleged to have imitated the plaintiff's Klaxet and Klaxonet devices.

In most of the infringement suits which the Lovell-McConnell company has instituted, but three patents have been named. In their two actions for infringement against the Sparks-Withington people, however, they name eight patents: Nos. 838,643, 923,048, 923,049, 923,122, 957,161, 1,043,703, 1,043,704 and 39,801.

The four suits were filed in the United States District Court for the Eastern District of Michigan.

International Motor Requires More Money.

Notwithstanding that in December last the International Motor Co., of New York, bridged threatened financial difficulty by negotiating a loan of $1,500,000 with an "inside syndicate" composed of stockholders, additional working capital has been found necessary to continue the production of Saurer and Mack trucks. A special meeting of the stockholders was held on Tuesday last to consider a plan whereby the required funds may be raised but, although a quorum was present, action was deferred for one week because, it is stated, certain of the stockholders desired time for further consideration. Information concerning the nature of the plan proposed is withheld.

British Car Adopts American Starter.

Indifference or pooh-poohing of the foreign press has not served to blind all of the British car manufacturers to the merits of electric lighting and starting systems. It is known that at least four of them are almost ready to announce their adoption of another American device, and it is now common property that the Sheffield Motor Works, Ltd., has contracted to use the U-S-L system. It will be applied to the Sheffield-Simplex car, which is one of the highest priced automobiles in the world.

Wilcox Sells His Standard Truck Interests.

Howard Wilcox, president of the Standard Motor Truck Co., of Detroit, which he organized, has disposed of his holdings in the company to M. S. Fisher, its treasurer, who at once assumed the presidency and who will retain the treasurership, also. Wilcox, it is stated, will at once engage in the manufacture of a five-ton truck, the design of which he has well in hand.

MAY "SICK" A GRAND JURY ONTO BANKRUPT MICHIGAN

Attorney General Asks for Special Prosecutor and an Investigation—Court Turns Down Gerber and Orders Certain Assets Sold.

Following a hearing in the United States District Court in Grand Rapids on Friday last, 3rd inst., Judge Sessions ordered the Detroit Trust Co., as trustee of the Michigan Buggy Co., of Kalamazoo, to enter into a contract with Samuel L. Winternitz & Co., of Chicago, for the sale of certain of the assets. The Chicago firm guaranteed to dispose of the tangible personal property, exclusive of real estate and manufactured products, for $225,000 in return for a commission of 12½ per cent. E. F. Gerber, the Pittsburgh dealer who handled the Michigan cars, renewed his offer for the physical assets of the company, but his bid of $265,000 was again rejected.

On the same day this action was taken, the Attorney General of Michigan took the first definite step toward probing the criminal practices which are alleged to have contributed to the failure. His application for a special grand jury to investigate was granted. This action, which is rarely resorted to in Michigan, means that a special prosecutor will be appointed to conduct the investigation, which is expected to lay bare not only the system of high finance which kept the company afloat but the "velvet payroll" out of which four officers paid themselves more than $100,000 each year through a mythical firm, and gifts of cars to sheriffs and others which were charged against customers' accounts.

It is intimated that the official investigation will disclose even more startling irregularities, to say nothing of extravagances which took many forms. One Kalamazoo bank president already has resigned and V. L. Palmer, secretary of the Buggy company, has gone into bankruptcy

TANK'S "EXCHANGEABILITY" AN ASSET OF PREST-O-LITE

Federal Judge Says Searchlight Cannot Profit by System Built Up by Rival—Calls It Unfair, if Not Morally Wrong.

Aside from its rights to the trademark which is placed upon its gas tanks, the Prest-O-Lite Co., of Indianapolis, has created for its product an intangible and incorporeal quality of "exchangeability," the use of which is not permissible by any competitor, according to a decision handed down late last week by Judge Hollister in an action brought in the United States District Court for the Southern District of Ohio, sitting in Cincinnati, against Arthur C. Davis and Victor Gluchowsky, who trade as Coughlin & Davis and who handled Searchlight gas. The suit was brought to enjoin them from putting out the Searchlight product in Prest-O-Lite tanks, and Judge Hollister in very direct language gave the Prest-O-Lite Co. a decree.

The facts alleged in the complaint were that Coughlin & Davis had been supplied by the Searchlight gas and that the dealers had sold the tanks to car owners in Cincinnati; the defense included a claim that after the tanks were sold by the Prest-O-Lite Co. the ownership passed out of that company's hands and that, moreover, the refilled tanks bore a label stating that the tanks contained Searchlight gas. The Prest-O-Lite dealers' contracts were claimed a violation of the Sherman anti-trust law, but the court failed to attach much weight to this contention.

Other Federal courts have upheld the Prest-O-Lite Co.'s right to its trademark, but this is the first time decision has been passed upon its rights in the "exchangeability" which has been created through the building up of its service system. After discussing the claims, Judge Hollister said:

"And so the defendants, in order to sell Searchlight gas, the profit of which goes to them, and the Searchlight company which charges defendants' tanks with its gas, exchange with the user Prest-O-Lite tanks charged with Searchlight gas for empty Prest-O-Lite tanks and thereby reap a very considerable part of the value of the quality of exchangeability inherent in every tank the complainant sells. There is surely something unfair in this, if not morally wrong.

"Fair competition between the two systems is excellent, but the acts complained of do not involve competition between two systems. They involve a use by the defendants in the furtherance of their competitive business, and the appropriation, of something of value which actually belongs to their competitor. Instead of using their own system in competition with complainant's system, they actually make complainant's system the very medium through which their gas was introduced to complainant's customers . . . and it is equally clear that if such use is permitted, the result would be a total destruction of the complainant's business system. . . . The result of this would be not only disastrous to the business system built up by complainant but necessarily destructive of any similar system."

Adding that no one has the right to appropriate the quality of interchangeability created for its tanks by the Prest-O-Lite Co., Judge Hollister said, "Defendants' wrong does not lie in the mere use of old Prest-O-Lite tanks, but in using them to destroy the complainant's business system for the purpose of, or with the result of, injuring the complainant's business."

The court stated that "It is not like a label on a box or a package or a bottle," and "It would seem . . . that when an article has become known to the trade by its shape, size, color and general appearance and is identified by these or some of them, it cannot be used for competition."

Taking up the matter of the pasted-on label, the court held that it did not afford adequate protection for the rights of the Prest-O-Lite Co. Referring to the fact that certain parts of the label were inconspicuously printed, Judge Hollister said, "The Label is so devised that the negation of the contents being Prest-O-Lite gas is so placed and in such comparatively small type that one cannot but discover purpose in choice of description and selection and arrangement of type.

"Every time they sell a charge of Searchlight gas in a Prest-O-Lite tank, they either deceive the user desiring Prest-O-Lite gas (what he had before) or the purchaser knowingly takes Prest-O-Lite tanks charged with Searchlight gas. In one case they palm off their own goods as complainant's and trade on complainant's good-will; in the other they sell their own goods (gas) only because the purchaser knows he can, by having a Prest-O-Lite tank, participate in the system of business established by the complainant. In either case the complainant loses and the defendants gain by defendants' use of something which belongs to the complainant.

"The defendants' right to purchase old Prest-O-Lite tanks cannot be doubted, but they have not shown that it is cheaper to buy them than the genuine Searchlight tanks. If Searchlight gas is as good as or better than Prest-O-Lite gas, why not sell Searchlight gas and Searchlight tanks?"

STUDEBAKER CORPORATION CLOSES 5 MORE BRANCHES

Continues its Policy of Turning Retail Establishments into Dealerships—Branch Managers Head Four of New Organizations.

Pursuing its policy of discontinuing retail branches, the Studebaker Corporation has turned five more of its salesrooms over to dealers' organizations, the branch manager in four cases becoming the head of the new retail business. The cities affected are New York, Chicago, Salt Lake City, Denver and Minneapolis and St. Paul.

The Phelps Motor Car Corporation succeeds the branch in New York City and will retain the retail salesrooms at Broadway and West 59th street, while the wholesale distribution in the metropolitan district will hereafter be handled by the Studebaker Corporation from the headquarters of its horse-drawn vehicle business at 142 West 52d street. George H. Phelps, former branch manager, heads the new company, with Fred Sanford, formerly assistant manager, as vice-president and sales manager, Hanson Robinson, who has served long in the Studebaker sales organization, becomes branch manager.

Lafayette Markle, formerly Chicago branch manager, has formed the L. Markle Co. and has taken over the retail business and location at Michigan avenue and 21st street. C. R. Dashiell, formerly retail sales manager, and H. R. Levy, a salesman, are vice-presidents. The wholesale branch continues in the same location, but with B. F. Kinaman, a Studebaker veteran, as manager and E. M. Lubeck as his assistant.

In Denver, F. C. Cullen has supplanted the retail branch with the Automobile Sales Corporation; he retains the former salesrooms and retains much of the old staff, including former Retail Sales Manager C. W. Hulbert.

C. A. Quigley, who formerly directed sales in Utah and some adjoining territory, with headquarters in Salt Lake City, now is a dealer and distributer in the same territory with about 30 subdealers.

The Minneapolis and St. Paul retail branch has been taken over by A. A. Gray, former branch manager, who now will conduct the business in the Twin Cities for himself.

Velie Reestablishes Cincinnati Branch.

After having abandoned that city some two years ago, the Velie Motor Vehicle Co., of Moline, Ill., has reestablished its branch in Cincinnati. It is located at 123 East 7th street and is in charge of Ferd Wagner.

WOMAN AT OR NEAR BOTTOM OF MILWAUKEE BANKRUPTCY

August John Says Elsie Forced Motor Maker's Failure by Refusing to Pay for Stock—Seeks to Tie up $30,000 Notes He Gave.

It transpires that there was a woman at the bottom, or near the bottom, of the failure of the Milwaukee Motor Co., which went into the hands of a receiver on June 18th. The fact was brought out last week when August F. John obtained a court order restraining Elsie K. John from disposing of two notes which he had given her as security for $30,000 he had borrowed to invest in the Milwaukee company, which manufactured engines for the automobile trade.

With the money, John purchased 465 shares of stock, on the understanding that Elsie and H. G. John, Ernest G. Miller and Fred A. Miller would also invest in the company. They did so, it is stated, to the extent of 1,313 shares and, in due course, August F. John, in pursuance of an agreement, was elected a director and vice-president and made general manager of the company at a salary of $5,000 per annum.

Soon afterward, he alleges, Elsie and H. G. John and Ernest Miller purchased 47½ additional shares and thereby obtained a majority and control of the company, and, obtaining it, at once proceeded to divest August John of authority. They reduced the board of directors from five to three, those who remained being Ernest Miller, J. C. Coerper and H. G. John, the latter of whom became general manager, August John being reduced to a clerical position.

Despite this turn of fate, August John declares he submitted and later, when it was announced that the concern needed more capital, offered to surrender one-third of his stock if the others did likewise, with the provision that Ernst Miller purchase the surrendered stock. It is alleged that all agreed to this arrangement by signing a contract. The total value of the stock turned over at this time was $83,333.33. Ernest Miller bought a number of shares of the stock turned over, for which he paid $37,794.50. Elsie John also bought 417 shares, but, it is asserted, refused to pay for them. The plaintiff states in his complaint that "she refused to pay for the shares so that the company would be forced into bankruptcy."

The plaintiff declares that before the bankruptcy proceedings were instituted, his shares of stock were worth $31,000. He now alleges that his obligation to redeem the notes held by Elsie John is not obligatory, as the defendant was the cause of the insolvency, whereby he lost $31,000.

One Zenith-Stromberg Suit Dismissed.

Exactly paralleling a similar suit last year, when their positions were reversed, the suit for infringement of the Baverey patents, covering the plain tube principle, brought by the Zenith Carburetor Co., of Detroit, against the Stromberg Motor Devices Co. came to a sudden and unexpected end when ready for trial in the Federal court in Detroit last week. On motion of the plaintiff's counsel the suit was dismissed, although the Stromberg legal representatives declared their readiness to go on with the case. The Zenith people explain that the suit was dismissed because the Stromberg interests are no longer active in making or marketing the particular feature which they were claimed to infringe, the dismissal of the suit saving the expense and delay incident to carrying it to a conclusion.

The countersuit brought by the Stromberg company against one of the Zenith Carburetor Co.'s customers remains on the calendar, and will probably come up for hearing next month. The customer in question, the John A. Bender Co., is only a nominal defendant, however, as the action is being defended by the Zenith company itself. In this case it is charged that the Zenith Carburetor Co. infringed the O'Hara patent, No. 684,662, and the Richard patent, No. 791,501, both of which are owned by the Stromberg Motor Devices Co.

Wahl Ends Life with Carbolic Acid.

George J. Wahl, manager of the Wahl Motor Co., of Detroit, committed suicide at his home in that city on Sunday last, 5th inst. He was found dead in his garage in the rear of his home, a bottle which had contained carbolic acid, which lay beside him, telling the manner in which he had sought death. He was 35 years of age and is survived by his widow and a five-year-old son. Wahl had thrown extraordinary energy into the company which bears his name, and which is just about firmly establishing itself, and the only possible cause that can be ascribed for his rash act is that he suffered a temporary mental aberration because of his close application to business.

Oakland Sues Home City for Damages.

The Municipality of Pontiac, Mich., has been made defendant in a suit for $30,000 damages brought by the Oakland Motor Car Co. The damages are alleged to have been sustained when water from a leaky drain backed into the basement of the Oakland factory. Among other things, the complaint alleges "that the city failed in its duty to construct, lay out and maintain the said drain, even after notified."

"UNCLE SAM" PRESENTS HIS CARD AT FORD CAR WORKS

Wants to Know if Price Maintenance Doesn't Infringe Anti-Trust Law—Queer Outgrowth of Suit Against Price-Cutter.

Although the first steps were taken months ago, it just has become generally known that the Attorney General of the United States has been inquiring into the affairs of the Ford Motor Co., of Detroit, because of a charge of violation of the Sherman anti-trust law growing out of its suit against the Union Motor Sales Co., of Dayton, Ohio.

The latter, it will be recalled, was charged with violating Ford patents, and other Ford rights, by offering Ford cars for sale at less than list prices, and later was called to task for violating an injunction.

The effort of the Ford company to maintain its price is the basis of the allegation of violation of the anti-trust law, the charge being founded on the recent ruling of the Supreme Court that manufacturers have not the right to fix the re-sale price of goods.

The Dayton concern retorts that any violation of the court's injunction it may have committed was due to efforts of the Ford company to induce it to offend in the endeavor to obtain evidence.

The Ford company denies that it engaged in such inducement, but James Couzens, vice-president and treasurer of the company, states that when the Federal investigator first appeared at the Ford office he was told that the Ford company would admit everything, being confident that it was well within its rights.

Sues for Payment on W., C. & P. Assets.

Claiming that Chester Griswold, George A. Ellis and Howard C. Dickinson, who agreed to buy the assets of Wyckoff, Church & Partridge, Inc., failed to make the payment of $50,000 which was due July 30 last, John S. Sheppard, trustee in bankruptcy for the corporation, has filed suit against the trio in the Supreme Court for New York county; he claims the three entered into an agreement November 30, 1912, with H. B. Hollins & Co., bankers, as guarantors, to purchase the assets for $150,000, to consist of three payments, respectively four, eight and twelve months after the transfer of the property.

The assets of the corporation, which, among other ventures, held the Commer rights in America, included holdings in the Standard Auto Co. of New York and the Decauville Auto Co. and were subject to a mortgage of $248,000.

86 CARS ALLOTTED SPACE FOR FIRST NATIONAL SHOW

Sixteen "New Faces" to Appear in Grand Central Palace—84 Cars at Chicago Exhibit—Other Business at Chamber's Meeting.

If ever doubt existed regarding the feasibility of placing on the three floors of Grand Central Palace all of the car exhibits that will constitute the New York section of the 14th Annual National Automobile Show of the Automobile Chamber of Commerce which will hold the boards between January 3d and January 10th, it was dispelled on Thursday last, for 86 makers of pleasure cars were allotted space and ample room for every one of the 86, of which six are electric makers, has been found; and there still remains plenty of space for the accessory exhibitors, who will occupy the whole of the fourth floor and a good part of the third floor, and who will be allotted space today (Thursday) by the Motor and Accessory Manufacturers.

In Chicago the exhibits will be housed in the Coliseum and the First Regiment Armory, as heretofore, allotment of space having been made to 77 makers of gasolene cars and seven makers of electrics. As usual, the allotment was made according to production, the largest producer among members of the Chamber receiving first choice and those who are not members being allotted space in their order of choice by lot.

Altogether, some 90 applications for space in Grand Central Palace and 100 applications for space at the Chicago show were received, and as the list now stands, New Yorkers will see five more makes of gasolene cars than they did last year and three fewer of electrics; in Chicago, there are seven fewer gasolene cars then there were last year and six more electrics.

Choice of space was governed by production figures, and as a result the Overland and Cadillac exhibits will have "pride of place" and come first in the line of vision of those who mount the marble stairs in the Palace; their spaces are directly at the head of the stairs, and behind them are the Buick, Studebaker, Hupmobile and Packard spaces. In the Coliseum in Chicago the Franklin and Krit spaces face the entrance on either side of the central aisle, Cadillac and Overland being directly at the junction of the two main aisles. Although electrics will be grouped on the second floor of Grand Central Palace, in Chicago they will be placed both in the Coliseum basement and in the Armory. The complete list of exhibitors at the two shows, except for half a dozen whose applications for space came too late to come before the meeting, is as follows:

NEW YORK.

First Floor.

Overland	Peerless
Cadillac	Velie
Buick	Abbott-Detroit
Packard	Mitchell
Chalmers	Pope-Hartford
Hudson	Winton
Pierce-Arrow	Studebaker
Hupmobile	Paige-Detroit
Oakland	Regal
White	Franklin
Reo	Premier
Cole	Lozier
Maxwell	Kissel
Rambler	Stearns
Locomobile	Apperson
Krit	

Second Floor.

Cartercar	Case
Stevens-Duryea	Haynes
Marion	Moon
American	Garford
National	Oldsmobile
Auburn	Marmon
Imperial	Mercer
Fiat	Stutz
Moline	Henderson
Pathfinder	Pullman
Speedwell	Westcott
McFarlan	Great Western
Kline	Herreshoff
Austin	

Third Floor.

Paterson	Metz
King	Cornelian
Partin	Palmer-Singer
Havers	Keeton
Vaughan	Thomas Howard
McIntyre	Simplex
Lyons-Knight	Davis
Norwalk	Twombley*
Mondex-Magic*	Chandler
Lomax	Am. Motorette*

Electrics

Standard	Ohio*
Detroit*	Baker*
Waverley*	Rauch & Lang*

CHICAGO ONLY.

Glide	Crow-Elkhart
Colby	Vulcan
Pratt-Elkhart	Cricket
McCord	

Electrics

Chicago	Broc
Argo	Borland-Grannis
Century	Woods

* Will not exhibit at Chicago.

Examination of the list brings to light that of the makes listed, some 16—all driven by gasolene—are new to show lists, or have been so long absent from them that their appearance is not altogether familiar. Nor do all the names appear on the list that last year swelled its size. Of the new comers, several, including the Cornelian, Lomax, Cricket and Twombley, are cyclecars, or are so near to being cyclecars that they may be so styled without fear of straining the meaning of the term. The others, with the exception of the Mondex-Magic, are full-sized cars of orthodox construction; the Mondex-Magic, however, is brand new in that it will carry a Magic motor, which is distinguished by sliding crescent valves instead of the usual poppet members.

In addition to allotting space, the Chamber of Commerce held a business meeting at which, among other things, the subject of exhibits at the Panama-Pacific Exposition in San Francisco, in 1915, was again discussed, but to no definite purpose. Although the members of the Chamber previously had voted against a special automobile building, and favored displays in the Transportation Building, the subject refuses to down and there is a bare possibility that the so-called Automobile Palace may yet come to pass.

In order that its title may properly designate its scope, the Chamber also considered a change of title. As soon as the necessary preliminaries are arranged, the body probably will be known as the National Automobile Chamber of Commerce.

Resolutions deploring the death of George W. Bennett, the Willys-Overland representative in the Chamber, and one of its most useful and active members, were adopted, and James Newton Gunn, once vice-president and still a director of the Studebaker Corporation, was chosen as his successor as a director of the organization.

Few Vehicles for Electrical Show.

Apparently, the Electrical Show which is to occupy Grand Central Palace from October 15 to 25, is not to be quite as representative an exhibition of electric vehicles as at first appeared would be the case. So far, only four makers of electric vehicles have signified their intention of exhibiting their products—only one of them is a pleasure car—and the exhibitors of merchandise of interest to those in the electric vehicle trade is confined to 10 spaces.

The complete list of exhibitors either in the electric vehicle trade or closely alllied to it is as follows: Edison Storage Battery Co.; Thomas A. Edison, Inc.; General Vehicle Co.; Manhattan Electric Supply Co.; Electric Storage Battery Co.; Ward Motor Vehicle Co.; Philadelphia Storage Battery Co.; Westinghouse Electric & Mfg. Co.; Rhineland Mch. Works; Gould Storage Battery Co.; General Motors Truck Co.; Ceneral Electric Co.; H. W. Johns-Manville Co.; Standard Electric Car Co. What the exhibition is lacking in vehicle displays, however, it is likely to make up in other things for, as was made plain in Motor World several weeks ago, there will be a model garage and repair-shop with all their various contrivances in action, and also a model battery room with a corps of able demonstrators and instructors in charge. As usual, the third floor will be occupied by a demonstration track, where any of the vehicles on view may be tried by those who are interested in them.

The Week's Incorporations

Philadelphia, Pa.—Mecca Tire Co., under Delaware laws; authorized capital, $100,000.

Grand Rapids, Mich.—Michigan Tire Co., under Michigan laws; authorized capital, $20,000.

Detroit, Mich.—White Motor Sales Co., under Michigan laws; authorized capital, $5,000. Corporators—A. L. Waldorf, W. J. Hays.

Kalamazoo, Mich.—Kalamazoo Motor Vehicle Co., under Michigan laws; authorized capital, $35,000. Corporators—Frank G. Clark and others.

Boston, Mass.—Endurance Tire & Rubber Co., under Massachusetts laws; authorized capital, $3,000. Corporators—John H. Cooper, John L. Hamilton.

Lansing, Mich.—Acme Engine Co., under Michigan laws; authorized capital, $80,000; to manufacture engines. Corporators—Lawrence Price, Jacob Gansley, Fred Thoman.

Liberty, Ind.—Stanley Motor Co., under Indiana laws; authorized capital, $5,000; to deal in motor vehicles. Corporators—Ray C. Connor, Nathan F. Stanley, C. C. Connor.

New Orleans, La.—Pop's Auto & Taxi Service, Ltd., under Louisiana laws; authorized capital, $5,000. Corporators—Wm. P. Johnston, M. R. Johnston, G. R. Guillemet.

Canal-Fulton, Ohio—Fulton Drop Forge Co., under Ohio laws; authorized capital, $10,000; to manufacture general forgings. Corporators—W. C. Laiblin, C. A. Irwin, H. D. Pownall.

Lynn, Mass.—Eastern Avenue Garage, Inc., under Massachusetts laws; authorized capital, $10,000; to operate a garage. Corporators—W. H. Beede and William J. Meloy, both of Lynn.

Boston, Mass.—Somerset Garage Co., under Massachusetts laws; authorized capital, $15,000; to operate a garage. Corporators—J. J. Shea, 3 Maitland street; Louise Lucier, Cambridge.

New Bern, N. C.—Glenbernie Transportation Co., under North Carolina laws; authorized capital, $50,000; to carry passengers by boat and automobile. Corporators—Clyde Eby and others.

Ottawa, Can.—S. G. Gay Co., under Canadian laws; authorized capital, $200,000; to manufacture motor vehicles, carriages, buggies, etc. Corporators—Simeon G. Gau, Chester T. Bangs, L. W. Nichols.

Chicago, Ill.—Universal Auto Supply Mfg. Co., under Illinois laws; authorized capital, $50,000; to manufacture and deal in machines, mechanical devices etc. Corporators—C. S. Tuttle. G. Burke, Joseph Frese.

Columbus, Ohio—Gaither Auto Co., under Ohio laws; authorized capital, $10,000; to manufacture and deal in motor cars. Corporators—William Gaither. Allen Leamy, Jesse J. Brown, William B. Leamy, L. E. Andrews.

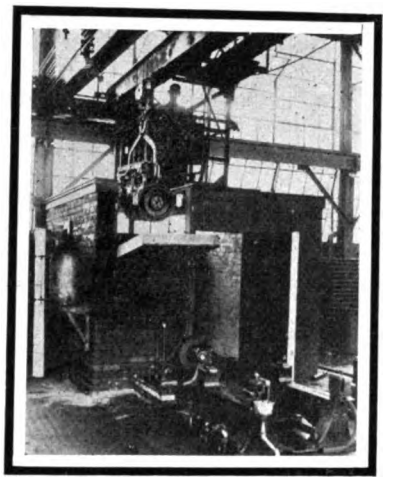
Bronx, N. Y.—Gasoline & Oil Supply Co., Inc., under New York laws; authorized capital $10,000. Corporators—James M. Pugh, 1978 Bathgate avenue; John H. Story, 2260 Ryer avenue; Walter W. Friend, 1807 Mt. Hope avenue.

Cleveland, Ohio—National Motor Supply Co., under Ohio laws; authorized capital, $5,000; to manufacture and deal in motors of all kinds. Corporators—V. H. Meyer, H. G. Schowe, F. F. Abbott, N. E. Sargent, Fred D. Demuth.

Denver, Col.—Standard Automobile Mfg Co., under Colorado laws; authorized capital, $500,000; to manufacture commercial vehicles and accessories. Corporators—J. W. Crook, George L. Kelley, F. M. Stanard, Frank McGee, R. C. Turner.

Detroit, Mich.—Gasolean Co., under Michigan laws; authorized capital, $7,000. Corporators—Fred E. and Almon C. Holmes, John B. Whelan, William L. Wild, J. Edward Bland, Cecil R. Crary, William L. Carpenter, Flavius L. Brooke.

Yonkers, N. Y.—Colonial Garage Co., under New York laws; authorized capital, $10,000; to operate a garage. Corporators—George H. Mills and F. S. Jones, both of 154 Nassau street, New York; Charles Smith, Central avenue, Yonkers.



Brooklyn, N. Y.—Safety Rubber Tire Co., under New York laws; authorized capital, $500; to manufacture and deal in all kinds of rubber tires. Corporators—Frank Kronenberg, Minnie E. Kronenberg and William Kronenberg, all of 497 Dean street.

Chicago, Ill.—Rail & Auto Sundries Co., under Illinois laws; authorized capital, $5,000; to manufacture and sell motors of all kinds, railway and auto supplies and accessories. Corporators—William W. Bishop, Raphael B. Jamison, William J. Anderson.

Guilford, Me.—Tire Buyers, Inc., under Maine laws; authorized capital, $600,000; to manufacture, buy, sell and deal in automobile tires, casings, tubes and also to deal in motor cars, etc. Corporators—Henry Hudson and James H. Hudson, both of Guilford.

New York, N. Y.—Brockway Motor Truck Sales Corporation, under New York laws; authorized capital, $15,000. Corporators—Richard C. Sack, 71 Elmwood street, Woodhaven; John F. Soby, 400 Simpson place, Peekskill; William N. Brockway, Cortland.

"SILENT" ROOM FOR MOTOR TESTS

WHEREIN ENGINES ARE TESTED IN CONTINENTAL FACTORY IN DETROIT FOR PURPOSE OF DETECTING NOISES

Changes in Capitalization.

Cleveland, Ohio—A. E. Davis Motor Co., from $10,000 to $50,000.

Connersville, Ind.—Howard Motor Car Co from $10,000 to $100,000.

Akron, Ohio—Swinehart Tire & Rubber Co., from $800,000 to $1,000,000.

Cleveland, Ohio—Automobile Signal & Appliance Co., from $25,000 to $50,000.

Digitized by Google

POPE DISCLOSES EARNINGS FOR YEAR ENDING JULY 31

Gross Sales Increased, but Increase of Expenses Netted $67,000 Loss—Total Assets Are Listed at $9,090,081.76.

Despite the fact that its gross sales in both automobile and bicycle departments showed an increase over previous years, the Pope Mfg. Co.'s fiscal year, which ended July 31st last, netted a loss of $67,551.28, as against a profit of $251,290.02 during the previous fiscal twelvemonth, at which time the Pope surplus stood at $1,012,920.87.

In 1912, dividends of 6 per cent. on the preferred and 1 per cent. on the common stock were paid, but when this year both dividends were passed it became known that the company would not be able to make a favorable showing and its balance sheet, which just was made public this week, therefore caused small surprise.

President Albert L. Pope attributes the loss to unusual expenses incurred in the development of new motorcycles, and also to the necessity of adding engine starters and other equipment to automobiles, the demand for which had not been foreseen. The heavy interest charges occasioned by the large amount of money borrowed at high rates was another factor in the case.

For the 1912 fiscal year, the sales amounted to $3,374,112.56, on which was made a net profit of $251,298.02. This year the total sales are not given. The income from operation, however, totals $259,239.40, as against $316,877 last year.

The assets of the Pope company are listed at $9,090,081.76, of which $6,241,070 is represented by land, buildings, equipment, machinery, patents, good-will, etc., of which sum $3,734,109.95 is represented by the patents, good-will, etc. Last year all of these assets were carried as one item at a valuation of $5,620,251.

In presenting the report, Col. Pope said that gross sales showed an increase over previous years, the increase being largely due to a new model car at a low price and new models of motorcycles, all of which were placed on the market for the first time during the current year. The extra equipment was not provided for in the selling price. The balance sheet follows:

POPE BALANCE SHEET, JULY 31, 1913.

Assets.

Patents, Licenses, Trade Marks, Good Will, etc.			$3,734,109.95
Land, Buildings, Equipment, Machinery and Tools			2,506,960.29
Deferred Charges and Prepaid Expenses, including Prepaid Insurance, Advance Work on Models for Future Production, Prepaid Discounts and Commissions			169,198.33
Contract to be Liquidated by Deferred Installments			160,241.66
Inventories of Materials, Supplies, Unfinished and Finished Product		$1,688,747.80	
Accounts, Drafts and Notes Receivable, (Less Reserves for Bad and Doubtful Accounts)		715,700.64	
Cash and Cash Items in Bank and Office, including Fund for Payment of Unclaimed Dividends		115,123.09	2,519,571.53
			$9,090,081.76

Liabilities.

Deduct—			
Reserve to provide for reduction in value of Inventories, and Drafts Receivable			96,463.61
Net Loss			$67,551.28

INTER-STATE CONSIGNMENT WEAPON IN DEALER'S HAND

When Pardee and Manufacturer Fall Out Dealer Attaches Cars Shipped Him—Payment of Debt With Cars Causes Dispute.

When the Inter-State Automobile Co., of Muncie, Ind., recently shipped four "sixes" to Col. Kirby C. Pardee, its metropolitan distributer, it probably never thought these same cars would be used as the means of securing a claim against it by its dealer in a dispute over commissions; but such proved the case when Col. Pardee last week brought a suit against the manufacturer for $3,360.80 in the Supreme Court for New York county and secured an attachment for that amount. The attachment was levied on the cars, which had been shipped to Pardee on consignment and are still the Inter-State's property.

The dispute is based upon alleged sales by the manufacturer in the dealer's territory. He claims to have signed a year's contract May 8 of the present year to distribute Inter-States in Greater New York, Long Island, Staten Island and Westchester county. His commission was to be 25 and 5 per cent. on model 45's and $759.75 on model 40's. Now, however, he claims that the manufacturer, in payment of debts to people in the New York territory, placed three 45's and two 40's, on which Pardee demands commissions. He fixes the total commission on the five cars at $3,875.25 and says he was given but $514.45, leaving a balance due of $3,360.80.

About two days prior to the institution of the suit Col. Pardee declared his dealership contract cancelled and ceased to sell Inter-States. He formerly handled this and one other line, and since dropping the Inter-State has supplanted it with the Havers "six." A. Edward Schwartz, who is a general sales agent for the Inter-State, formerly occupied an office in Col. Pardee's establishment, but has located elsewhere since the rupture of relations.

Shaler Prepares to Double Output.

The C. A. Shaler Co., of Waupun, Wis., has broken ground for a three-story addition which will practically double its present capacity. The new building will be devoted to the production of the Shaler garage steam vulcanizer. The original plant was erected in 1911, and though it has been running 23 hours a day practically all summer it has been unable to cope with the demand, which fact serves as an indication of the remarkable growth of the vulcanizing business.

In the RETAIL WORLD

Hubbard & Witt plan to erect a garage in St. Paul, Minn.

H. C. Baxter, of Princeton, Iowa, has erected a garage.

J. W. Hartsuck, of Albia, Ia., is erecting a garage; it will stand on South Main street.

John C. Drew has sold his interest in the Warwick (N. Y.) Auto Co. to Isaac D. Vance.

Herbert L. Clark, of Wayne, Pa., has secured plans for a two-story brick and stone garage.

Charles Peterson, formerly of El Monte, Cal., has opened a garage in Covina, in the same State.

T. Dewitt Beekman, of Dundee, N. Y., plans to erect a garage; it will stand on Water street.

O. J. Meyer, of Milwaukee, Wis., plans to build a garage; it will stand at 2826 Cedar street.

J. W. Collins, of San Antonio, Tex., will open salesrooms on Alamo Plaza; he has the Dorris agency.

E. W. Griffin is building a garage in Alhambra, Cal. It is located on Main street, near Wilson street.

B. L. Zapp, of La Grange, Tex., plans to erect a garage and supply store; the estimated cost is $2,000.

J. G. Stratton, of Ilion, N. Y., has taken over the garage business of F. J. Dyett; Stratton will continue it.

O. A. Rhodin, of Los Angeles, plans to build a garage at 1664 West Washington street; it will cost $4,800.

A. S. Hahn, formerly of Hutchinson, Kan., has purchased the Stafford (Kan.) Garage; he will operate it.

B. C. Brown and F. D. Frazier are about to build a garage in Dufur, Ore. It will adjoin Frazier's blacksmith shop.

E. B. Grabt and W. E. Roberts have purchased the Central Garage in Lodi, Cal. They will continue the business.

G. H. Prather and Earl Lupfer have purchased the garage of J. M. Hansell, in Tampa, Fla. They will operate it.

The Duluth (Minn.) Auto Co. has taken possession of new quarters; they are locatetd at 329 East Superior street.

Edwin J. Thomas, of Youngstown, O., has secured plans for a garage to be erected on Elm street, near Madison avenue; Thomas stocks the Kline line.

E. L. Smith, of Clarksville, Ia., has purchased the interest of Henry Klunder in the Cutler & Klunder Garage; the style will now be Cutler & Smith Garage.

Hiram C. Gibson has awarded the contract for a garage, 50 x 60 feet, which he will have erected in South Deerfield, Mass. The site is on South Main street.

Dudley F. Benton and Walter Storms have entered the trade in Poughkeepsie, N. Y., under the style Benton's Garage; they are located at 39 North Clover street.

Frank Zinnel, of Savanna, Ill., has sold his interest in the Clinton Garage to M. Messer; the style now is Messer & Dahler. Zinnel may remove to California.

P. A. Hall, of Minneapolis, and T. L. and P. W. Hall, of Waterloo, Ia., are about to open a garage in the latter city at 418-28 East 2nd street; the style will be Hall Bros.

D. W. Alderman, Jr., formerly of Alcolu, S. C., is about to open a supply store in Florence, in the same State; he has secured quarters at Church and Evans streets.

John I. Bagdzuina, of Chicago, has secured permission to build a one-story garage at 2334-36 South Oakley avenue; the application states that the cost will be $1,000.

P. F. Wicks and Bert Donley, of the Wicks & Donley Hardware Co., of Ashland, Ohio, have become automobile dealers; they have secured the Crow-Elkhart agency.

Ely Kirby and James H. Hubbard, garage operators in Red Bank, N. J., have dissolved partnership; Kirby will conduct the accessory end of the business and Hubbard the garage.

E. M. Miller, of South Pasadena, Cal., who recently purchased the Pierce Bros. Garage, on Blair Oaks avenue, has resold it to McCreary & Ward; the latter will conduct the business.

The automobile livery service of the Hotel Munroe, in Joliet, Ill., has been taken over by Rhodes Bros. They formerly operated the Clinton Street Garage. To new cars have been placed in service.

W. N. Darby, of Cameron, Me., has admitted Burnham E. Shaw to partnership in the Darby Auto & Supply Co. The garage which the concern operates will be improved and the business extended.

W. J. Berrington, of Ritzville, Wash., has sold the Inland Garage, on 1st street, to Stahl & Peoples, of Walla Walla, in the same State; Berrington has taken over the real estate and loan business of E. H. Herring.

Russell H. Erskine and Frederick N. Burr, who operated a garage in Meriden, Conn., on East Main street, have dissolved partnership; Burr has retired and the business will be continued by Erskine and Herbert Baldwin under the style Central Garage.

L. F. Teed and Murrell Ellis have reopened the garage in Devil's Lake, N. D., formerly operated by the State Auto Co. They have changed the style to Great Northern Auto Co. and will handle Packard, Pierce, Stutz and Marion cars. Teed is manager of the Western Union office in that town and Ellis has been an auto polo driver.

Clell Trammell has taken over the Big Four Garage, on Cherry street, Huntington, Ind., formerly operated by Lewis Shinkle and William Richardson; he exchanged his farm of 140 acres in Rock Creek township for the business. The garage carries with it the Studebaker, Maxwell and Overland agencies. The total amount involved in the deal was $37,000.

J. E. Robison, formerly connected with the sales department of the Empire Motor Car Co., of Indianapolis, has entered the trade for himself in Des Moines, Iowa. He has secured the Iowa agency for the Allen line and has opened salesrooms at 413 12th street, where the Cole agency formerly was located. The latter has been moved to the former Cadillac salesrooms on Locust street.

E. H. Bull, formerly sales manager for the Franklin Automobile Co., of Syracuse, N. Y., in the northwestern district, has taken over the retail business in Denver under the style Colorado Motor Car Co. He formerly was a division sales manager for the New York Leather Belting Co., and is a brother of C. W. Bull, of Bull & Young, who recently took over the Franklin retail business in Syracuse.

Digitized by Google

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

F. R. Pendleton has been appointed Eastern sales manager of the Commerce Motor Car Co., of Detroit, maker of the Commerce truck. Previously he was with the General Motors Co.

N. Bowland has been appointed advertising manager for the Duff Mfg. Co., of Pittsburgh, Pa., manufacturers of Barrett jacks. Previously he performed the same service for the Buffalo Forge Co.

J. B. Magee has been appointed manager of the branch in Phoenix, Ariz., which just has been established by the United States Tire Co. Previously he was attached to the advertising and publicity department.

S. M. Udale, former assistant research engineer in the Studebaker Corporation, has joined the staff of Joseph Tracy. He will have charge of the latter's laboratory and motor testing plant in Rutherford, N. J.

W. G. Miller has been promoted to the post of sales manager of the Pullman Motor Car Co., of York, Pa. He is not strange to his duties, however, as he has been a member of the Pullman staff for several years.

John A. Boyle and James A. Holihan, respectively vice-president and general manager and assistant general manager of the Briscoe Mfg. Co., of Detroit, have resigned their offices. Their resignations took effect immediately.

Harry M. Robins, sales manager for the Ames Motor Car Co., of Owensboro, Ky., has resigned that position. While his future plans are not definite, it is probable that he will engage in the manufacture of parts in Michigan.

J. H. Mack, for many years with the Alco Boston branch, has joined the selling force of the Autocar Co., of Ardmore, Pa. He becomes supervisor of the sub-stations of the Autocar Co. in New England, with headquarters in Boston.

E. G. Bland has been appointed manager of the Detroit branch of the Jackson Automobile Co. He succeeds E. V. Chilson, who has been transferred to the factory sales department in Jackson, Mich., to which Bland previously was attached.

Wallace E. Wilber has been appointed factory manager of the Detroit-Goodspeed Mfg .Co., of Detroit. Because of his health, Wilber has not been engaged in business for about a year, but previous thereto he was one of the assistant superintendents of the Cadillac Motor Car Co.

Joseph A. Anglada has disposed of his holdings in the Anglada Co., of Detroit, manufacturers of demountable rims and automobile accessories, and has resigned the presidency of that company; he has acquired an interest in a company which will manufacture a small car of his design.

James T. Wilson, for four years buyer for the Durant-Dort Carriage Co., of Flint, Mich., has been appointed purchasing agent of the Buick Motor Co. He succeeds E. J. Copeland, who resigned to become general manager of the Corcoran Lamp Co., of Cincinnati, an office, however, which he will not assume until January 1st.

James W. Wellington, manager of the Maxwell-Newcastle Co., has resigned that office, to which he was appointed soon after it was acquired by the Maxwell Motor Co. Previously Wellington was one of the vice-presidents of the United States Motor Co. and one of the few officers who remained in the service of its successor, the Maxwell Motor Co.

C. O. Brandes has been appointed manager of the expert department just established by the Firestone Tire & Rubber Co., of Akron, Ohio. Although having been identified with the rubber trade for the greater part of the last eight years, Brandes is a German by birth, and maintained a residence in Germany until 1905, which implies an intimate acquaintance with foreign conditions.

G. A. Coats and J. B. Barcus have been appointed district managers for the Haynes Automobile Co., of Kokomo, Ind. Coats, who previously was with the Michigan Motor Car Co., will have the Wolverine State as his territory, while Barcus, formerly identified with the Marathon Motor Works, of Nashville, Tenn., will represent the Haynes interests in Missouri, Kansas, Nebraska and Oklahoma.

R. W. Phelps, at one time sales manager of the Great Western Automobile Co., and later advertising manager of the Moline Automobile Co., of East Moline, Ill., has resigned the latter office to become president of the Zip Cyclecar Co., of Davenport, Ia. Associated with him in the new venture are G. Decker French, president of the Iowa State Automobile Association, and Frank W. Skinner, of the Mitchell Advertising Agency.

E. L. Vail, widely known because of his long connection with C. F. Splitdorf, and until recently sales manager of the Hoffecker Speedometer Co., of Boston, has joined the staff of the Waltham Watch Co., of Waltham, Mass., which recently has created an automobile timepiece department. Vail, almost unnecessary to say, will specialize on the Waltham automobile timepieces, of which there are some 14 different models.

Harry E. Field, who on January 1st last was promoted from the management of the Thomas B. Jeffery Co.'s branch in New York to the post of factory sales manager, has resigned the latter office and returned from Kenosha to New York, where he will devote himself to the Kelly-Field Co., distributors of Lee tires, and of which he is a part. Field did not feel that he could relinquish his handsome interest in the latter company without adequate remuneration and his resignation from the Jeffery staff grew out of that fact.

Minor Business Troubles.

A receiver has been asked for the Archey-Atkins Co., of Indianapolis, by the Taylor Mfg. Co., which has a claim of $300; it charges that the company, which has the agency for several lines of cars, is winding up its business, but this is denied.

The Julian Motor Co., of East Syracuse, N. Y., which started about a year ago to build "the highest priced motor," but which encountered financial rocks several months ago, has filed schedules in bankruptcy; the assets are nominally $15,713 and the liabilities $24,942, including wages, $[illegible] The

Although the hearing showed the company to be in a sound condition, a receiver has been appointed for the Halsey Automobile Co., of St. Louis, which fell into trouble last spring because of internal dissension; Charles Cummings Collins was named receiver but will not conduct the business until an appeal in the litigation is decided in Missouri. J. D. Perry Lewis, a stockholder, in March started the litigation, claiming Oscar L. Halsey, the president, has raised his own salary from $4,200 to $20,500 a year. In June the court ordered Halsey to cut his salary and to turn into the treasury $10,000 he is alleged to have made on a sale to the company of a piece of real estate, but Halsey has seemed unwilling to comply.

Recent Losses by Fire.

Richmond, Va.—Frank D. Schulter; garage damaged. Loss, $5,000.

Dallas, Tex.—Stutz Auto Co. and Knight Tire & Rubber Co.; building and contents damaged. Loss, $10,000.

South Manchester, Conn.—Harry Madden, Laurel street; garage and three cars destroyed. Loss, $3,000.

Cleveland, Ohio—Ohio Auto Carriage Co.; building damaged; stock of bodies and body-building machinery destroyed. Loss, $50,000.

APPEAL OF THE ECONOMICAL CAR.

It is slowly dawning on a considerable portion of the trade that in each respective price-class it is the economical car that holds out the strongest appeal to the greatest number of persons. The old idea that the expense of operation, or up-keep, means little or nothing to anyone able to afford an automobile of any sort is being gradually dissipated.

With the realization is coming keener appreciation of the truth that, while power is necessary and desirable, the surest way to obtain it is not by increasing either engine strokes or bores. In other words, the "big" engine is not necessarily the most powerful or efficient engine; as often it is the most wasteful and, therefore, the most uneconomical one.

Abroad, where the price of gasolene is steep and the tax on horsepower high, they were quicker to learn the lesson, and there the comparatively small motor has been brought to a state of efficiency which, when coupled with proper regard for frictional losses in other parts of the car, has resulted in the production of many automobiles which in respect to power, efficiency and economy should long since have given pause to American manufacturers.

With the dawn of reason, it appears probable that the so-called big motor, such as has been in almost general use in this country, has reached its zenith and must be succeeded by one smaller but equally or more powerful and, therefore, more efficient and certainly more economical.

When the subject is calmly considered, it seems rather amazing that Americans have so long remained content with engines consuming approximately twice the fuel of those of foreign manufacture, although in this connection it is fair to say that the difference between the American gallon and the Imperial gallon is seldom, if ever, remarked. The fact that six Imperial gallons are equal to five American gallons accounts for at least a small part of the superior economy of foreign engines but not enough greatly to affect the general result.

"COMMERCIALIZATION" OF THE SPORT.

Abandonment of the Vanderbilt and Grand Prize races by the Savannah Automobile Club, for the same reason that caused the abandonment of so many other events—failure to attract a sufficient number of entries—has caused the president of that Georgia organization to declare that automobile sport has become "commercialized."

The gentleman, however, is in error, or, at any rate, does his judgment no credit. For automobile sport was "commercialized" soon after its inception and has remained so at all stages. It was engrafted on the industry, but despite the fact there never was a time when sport and business remained close together for any considerable period. It is merely a matter of time when they fall apart. Sport is foreign to industry and, though it may serve temporary purposes, it can never become a part of it.

Racing and other forms of sport have served the purposes of the automobile trade, as has been perfectly apparent for some three years. Wishes that are father to the thought, and whistling to keep up courage, may serve individual or special purposes, but they will not affect the ultimate result. The pity of it all is that when even these purposes are served practically no automobile sport will remain, for those who should have made it their duty to do so, and who must have foreseen the result, permitted the sport to become so thoroughly and utterly "commercialized" that amateurism was wholly lost sight of.

The present situation merely adds emphasis to the fact that amateurism, however pooh-poohed, is the foundation of all sport and that without it no sport can or will endure.

GLASS ON THE PUBLIC HIGHWAYS.

Let it be written large: Two boys have been arrested in Cincinnati for throwing glass on the roadway. Although in some States, certainly in many of the larger cities, the doing of that sort of thing constitutes an offense, it is rare that the police take notice of it; when they do so, as in the Cincinnati case, it is worthy of more than obscure mention.

None knows better than the motorist how much broken glass is to be found on the public highways in the course of a day's travel. The fact that it is more or less of a menace not only to automobile or cycle tires but even to pedestrians suggests that a few local crusades, having for their object the enforcement of the anti-glass ordinance, probably would quicken the police consciences, and have a wholesome effect.

IMPORTERS PARE PRICES TO CONFORM TO DUTY REVISION

But Reductions Are not of Startling Proportions—Why Cut of 15 per Cent. in Tariff May Mean Drop of but 8 per Cent. in Price.

Enactment of the Underwood tariff bill and the institution of the lower duties have been the cause of considerable conjecture in the trade as to just what the new rates on automobiles and allied products would mean in dollars and cents to the American purchasers of these foreign products; that prices would be lower has been certain, but the degree of reduction is only now becoming apparent, as importers promulgate their new price schedules. Some already have adjusted affairs upon the new basis, and those who have not, have calculations well under way.

In the case of cars, the reduction will amount to from 6 and 7 per cent. up to 15 per cent. or better, a concrete illustration being found in a revised price list issued by the Peugeot Auto Import Co., of New York City. The lowest priced car formerly sold for $2,700, but now is listed at $2,500, a cut of 7.47 per cent. The highest priced car sold for $6,250 and now is $5,700, a reduction of 8.8 per cent. The Peugeot importers are also adding to their line the Bebe (Baby) Peugeot, which under the old tariff would have been listed at $1,350 but which now will be sold for $975, a reduction of 27.7 per cent. This is one of the heaviest cuts which thus far has been made in the importing car trade.

The Isotta-Fraschini Motors Co. has effected similar reductions: its highest priced car was $9,000 and is now $8,250, a reduction of 8 1/3 per cent. The lowest priced dropped from $3,500 to $3,250, a cut of 7.1 per cent. The Benz Auto Import Co., whose cars sell for above the $2,000 limit under which the duty on completed cars is cut, is not making any reductions, since it generally imports its bodies on its chassis and therefore has to pay the old duty of 45 per cent. The majority of the other car importers import chassis only and have the bodies built in this country. This permits them to import under the lower duty regardless of the price of the chassis.

Why the reductions are not of greater percentage is puzzling to many, since the tariff on cars invoiced at less than $2,000 was reduced from 45 to 30 per cent. and on chassis the same. The reason as given by one importer is that most people lose sight of the fact that the duty is levied on the foreign invoice price and not on the American selling price.

"Suppose a car is billed to us by the foreign manufacturer for $3,000," he says.

"The old duty was 45 per cent., or $1,350, making $4,350.

"Add $200, say, for expenses, making $4,550.

"Add 20 per cent., or $910, for profit, making $5,560.

"Now, under the new tariff of 30 per cent. everything remains the same except the duty, which is 30 per cent. of $3,000, or $900. This is $450 less than the old duty of $1,350. Subtract this $450 from the $5,560 that the car used to sell for. This leaves $5,110. The cut of $450 is a reduction of but 8 per cent. on the American selling price."

The same system of figuring applies to the numerous other products affected by the new tariff. Importers of bearings plan to give their customers, most of whom are manufacturers of cars, the full benefit of the reduced duty. The duty was dropped from 45 to 35 per cent., as was that on magnetos. The importers of these products state that because of the varying prices which prevail in quantity purchases it is practically impossible to furnish comparative prices under the old and new tariffs.

Peter A. Frasse & Co., importers of Renold chains, stated that the price of chains very likely will drop 10 or 12 per cent. This duty was cut from about 45 to 25 per cent., but, as explained in the case of cars, the reduction in actual selling price is not of such great proportions.

Tire prices, the duty falling from 35 to 10 per cent., mean a saving of from 15 to 20 per cent. to the American trade, despite the fact that the cut in the duty was one of 71 per cent. A comparison is furnished by the Gaulois Tire Cire Corporation, of 49 West 64th street, New York City. The plain tread Gaulois tire of 34 x 4 size formerly sold for $42.90 and now is $35.05, a cut of 16 per cent. The 36 x 4½ was reduced from $53.35 to $44.05, a reduction of 17 per cent. The 37 x 5 tire is now $52.85, whereas it was $64.90, which is a reduction of 18 per cent.

Effects of Advertising Invader Oil.

Whether advertising in the trade papers is profitable has been answered to the satisfaction of the Invader Oil Co., of New York, which, since May last, has conducted a double page advertising campaign in all of the leading automobile publications. While its business had been increasing gradually, as soon as the advertising campaign was undertaken the sale of Invader oils immediately jumped from 114 per cent. in February to 145 per cent. in May and finally to 292 per cent. in September. The average increase for the eight months figures out at 212 per cent.

WORK AND PLAY MIXED ON ELECTRIC MAKERS' PROGRAM

Good Attendance Promised for Convention of Electric Vehicle Association in Chicago—Topics for Discussion.

Much work and enough play and entertainment to relieve the monotony of professional sessions is included in the program for the Annual Convention of the Electric Vehicle Association of America which is scheduled to be held in the La Salle Hotel in Chicago during Monday and Tuesday, 27th and 28th inst. It is expected that fully 200 of the 450 members of the association will travel to the Windy City to listen to the papers that have been prepared. After an address by president Arthur Williams, a member of the Baker Vehicle Co. will address the meeting on "Electric Vehicle Salesmanship"; a representative of Gimbel Brothers' New York store will tell "Why We Adopted the Electric Vehicle"; F. E. Whitney of Philadelphia will report on "Electric Vehicle Tires," and "The Charging of Storage Batteries in Unattended Garages" will be the subject of a paper by M. R. Berry. "The Merchant, the Central Station and the Electric Truck" will be the subject of a paper by F. Nelson Carle, advertising manager of the General Vehicle Co. E. S. Callahan of the National Electric Light Association will talk on "Co-operation Between Electric Vehicle Manufacturers and Central Stations."

Other topics include a discussion of the effect of the electric vehicle on insurance rates, and sandwiched in between the sessions there will be dinners and theater parties and visits of inspection to the various power plants and other points of interest.

K-W is Ordered to Pay Royalty.

By order of the Court of Common Pleas of Cuyahoga county, Ohio, the K-W Ignition Co., of Cleveland, has been ordered to account, at the rate of 50 cents each, to the Unit Coil Co., of Jersey City, N. J., for all of the master vibrators which it has manufactured since March 1, 1912, under patents controlled by the Unit company; the latter is affiliated with the Connecticut Telephone & Electric Co., of Meriden, Conn. Meanwhile, and pending an appeal, the K-W company is also enjoined from manufacturing and selling such apparatus.

The suit grew out of a contract entered into February 20, 1912, between the parties to the litigation, whereby the K-W Ignition Co. was authorized to use master vibrators covered by the Willard E. Dow patent, No. 752,384, and the Ruben Miller, Jr., patent, No. 744,666, the contracts requiring that royalty at the rate of 50 cents each be paid monthly. The plaintiff alleged that no accounting had been rendered since March 1st of that same year and, therefore, brought the suit which just has been decided.

Jeffery Adds a "Six," Remodels "Four."

Promotion of one of its branch managers to the high post of general manager, and the elevation of another to the position of sales manager, has resulted in a semi-revolution of the Thomas B. Jeffery Co.'s Rambler cars.

Instead of restricting itself to a single four-cylinder model, the company hereafter will produce not only a "four" but a "six," and the "four" will differ radically from the present model in design, make-up and price. Its engine will have a bore of 3¼ inches and a stroke of 5¼ inches, developing on the block 42 horsepower. It will also mark the company's adoption of left-hand drive, center control and rear pressure feed gasolene tank. The new model utilizes a new model F & S ball bearing and Bosch magneto and will sell for $1,550, as against $1,875 for the present model, the new price, incidentally, including much more equipment than the old one. Those in position to know declare that the new "four" is by far the most perfectly balanced and in every way the best model that has ever borne the Jeffery nameplate.

The new "six" will be akin to the "four," but for the time being, at least, will employ a Rutenber motor and will list at $2,250

It's Alvan Dodge's Dodge Company.

That it is not always wise to jump at conclusions, and that there are more than two persons of the name of Dodge in Detroit, is indicated by the fact that several publications last week took it for granted that the incorporation of the Dodge Motor Car Co., of Detroit, signified that the two Dodge brothers, who are stockholders in the Ford Motor Co. and who are getting ready to put into effect their plans to build a car of their own, constituted the newly incorporated company. As a matter of fact, however, neither of those Dodges has anything to do with it. It takes its name from Alvan M. Dodge, secretary and treasurer of the Wahl Motor Co., and who is its chief incorporator. The others are Charles E. Kirby, of the Detroit Lubricator Co.; Edwin Herzog, branch manager for the Dime Savings Bank; J. M. Lemew, a druggist, and Dr. E. O. Millay, of Romeo. The capital is fixed at $1,000.

Dodge states that he had no idea of forestalling Dodge Bros., but as he has lived in Detroit all his life and purposes making low-priced cars, he saw no reason why he should not make use of his own name.

ARISTOS TO BUILD CARS AROUND ITS MAGIC MOTOR

Will Produce a Limited Number of "Sixes" in Two Sizes for Custom Trade Only—Chassis to Come from Palmer & Singer.

Having possessed itself of the American manufacturing and selling rights for the Fisher motor, which it has renamed the Magic, the Aristos Co., which is closely allied to the Motor & Gear Improvement Co. of 250 West 54th street, New York City, unexpectedly is about to embark upon the production of a limited number of high grade cars fitted with the engine. The action has been taken as a means to bring the motor forcibly to the attention of manufacturers, who, it is pointed out by an officer of the company, have been lethargic in grasping the opportunities which it represents in the matter of fuel economy and efficiency. The Magic motor differs from others principally in that it has sliding crescent shaped valves instead of the usual poppet members.

For the time being, the Palmer & Singer Mfg. Co. of Long Island City, which now holds the only existing license from the Aristos Co. and which will produce Magic motors for itself, will produce the cars, though it will not produce the motors for the latter company. The cars themselves will be high-grade and comparatively high priced; no attempt will be made to produce in quantities, and only custom work will be sought. The cars, which will be styled Mondex-Magic, will be built in two sizes and both will have six-cylinder motors, the smaller of which will have cylinders measuring 3⅜ x 4¾ and the larger 4 x 5 15/16 inches.

Arizona Car to Move to Michigan.

Holland, Mich., possesses what is known as a bonus committee and, due to its activities, it is probable that an automobile factory may be located in Holland's "midst." At any rate, it is stated that negotiations have been completed for the removal of the Spenny Motor Car Co., from Tucson, Ariz., to Holland, where a former engraving plant on West 24th street has been set aside for its use.

Until it was thus brought into the limelight it was not known that Arizona harbored an automobile manufacturer of any sort or size, but it is stated, nevertheless, that the Spenny company, of which C. A. Spenny is president, and which is capitalized at $500,000, produces the Spenny "six," a $3,500 car, of which three already have been turned out in Arizona.

STUDY BUYER AS SALES HELP

Value of Knowing the Prospect's Wants and Traits—How Learning About Him and His Family, Business and Life May Ease Way to Sale.

Study the buyer! That has been said again and again. It is a point of such overwhelming importance that it requires repetition and emphasis. It cannot be made too important a portion of a sales campaign.

Too often the thought is given only to the seller's side of the transaction. But, unless the plan is formulated, and carried out with a view to the buyer's requirements it stands little chance of success.

Ascertain Standpoint of Best Appeal.

You are selling an automobile. The buyer wants one. What can he afford to pay? What kind of a car will best harmonize with his means and social position? What are his habits? What will he use his car for chiefly? Is it a genuine necessity for his business? Can you appeal to him from the standpoint of increased business opportunity?

How large is his family? Has he strong social instincts? Would a car with extra seating capacity attract him? Does he appreciate that a few dollars more spent in first cost may save him many times the difference in repairs later? In a word, does the value "in the long run" have any significance for him?

Not Selling the Car, but the Buyer.

What about his wife? Do you know anything about the things that appeal to her? Can you find out? What would the rest of the family prefer?

These and a hundred other questions all bearing on the buyer are worth summarizing—and the answers will prove an amazing help in selling. Remember, as some one has said, "you are not simply selling the car, you are selling the buyer."

PROPER SURROUNDINGS AS AN AID TO SALESMANSHIP

Your salesroom should be properly lighted; it should have a clean floor and neatly tinted walls; it should be a neat and attractive setting for the cars you sell.

A diamond in a pawnshop or second-hand store has just as much color—just as much fire and just as much weight, size and purity as it had in the window of the leading jeweler. But it does not look the same; you would not buy it as confidently; you would not pay as big a price for it; in fact, you probably would not consider its purchase at all, even though you might want a diamond of that exact weight, size and color.

Association and Its Effect on Values.

What makes the difference? It is all in the surroundings, the associations. The value is there in the stone, but the atmosphere breeds suspicion.

Did you ever think how that works in a salesroom? The setting has a remarkably strong influence on the mind of the prospect. Do your cars get a fair show?

The suggestion is not to go to extremes. Have an attractive salesroom—and have it clean. Don't let a bright, new car rest side by side with a second-hand one that has seen better days. It does not pay.

SMILES AND NODS THAT WIN PATRONAGE FOR GARAGES

The business-creating effect of "immediate attention" is a subject that every dealer and garageman can well afford to give careful consideration.

Go into some garages and you are required to wait ten or fifteen minutes before anyone gives any sign of being aware of your presence. Perhaps the employe is busy pumping up a tire or serving oil or otherwise waiting on a customer. But even if he is the only one, as frequently happens, it should not debar him from at once passing a cheerful nod or smile to the new arrival.

Some employes treat the motorist who drives into a garage when they are busy as if he were a gross intruder. The chilling effect freezes any resolution or idea of further business, and the supply sale or adjustment that might lead to far more profitable relations simply becomes a negative advertisement.

Developing Winning Esprit du Corps.

An occasional word to employes showing them how great is the dependence of the institution on their cheerfulness, tact, and politeness towards customers will do much to develop the winning esprit du corps which is such a great factor in any business. Every employe is a salesman—no matter what he does.

TO PRESERVE THE FRESHNESS OF DEALERS' PRINTED MATTER

When printed matter is left flat on the top of a table something is sure to happen to it. Some of the top sheets get fly-specked, some get dust covered and good deal of it is likely to get dog-eared. Thus when you reach for one of those "attractive" circulars or booklets you note that the fresh, clean look that adds value and interest to all things printed, is conspicuous by its absence. The literature that was intended to attract is almost certain to detract—and if the top ones are lifted off each day and thrown away somebody is paying the printer for nothing.

The plan followed by the Neumann-Lane Co., of Detroit, is a good one. When printed matter comes from the factories only a few samples of it—say, half a dozen specimens—are placed on the table in the showroom. The main stock is kept in a sectional bookcase, where it is instantly accessible, easily seen, and protected.

KEEP DATA AND GOODS HANDY

Place for Everything and Everything in its Place—Value of Neatness and Order —Supplyman Who Has Built Business upon a System.

The most impressive feature of the store of Richard M. Kaough, proprietor of the Fort Wayne Vulcanizing Works, Fort Wayne, Ind., is its neatness and orderliness. That means that Kaough recognizes several of the vital principles of good merchandising—clean windows, clean floors, clean stock. And everything in order.

Kaough Does not Guess—He Knows.

From practically nothing, Kaough in seven years has built up a business to be proud of. It meant slow, hard work, but at every stage of it Kaough's business was in order—externally and internally. Ask Kaough a question about his business and he does not guess—he knows. What are his sales to date? He has the exact figures every day. How much cash has come in during the year? The cash register which records every dollar received—whether across the counter, by mail, or collected personally—tells the story right up to the minute. How much has he outstanding? His records tell this instantly, as they tell everything it is necessary for a merchant to know to guide his business to success.

Knows Costs, Prices and Quantities.

What is the stock of a certain article? How much did he pay for it? When did he get it? How much did he buy—He can tell you instantly. It would take some dealers about a week to get this information. It should be immediately available to have any value.

From which it will be apparent that Kaough looks after the little things. A large part of his business is the sale of tires. These are kept down cellar in a cool, dark place. Everything is as orderly as a factory stockroom. No chance to get mixed up or be uncertain as to what size or how many on hand. The main floor is devoted to accessories and office. The stock is kept in show cases and wall cases except oils in cans, which are on open shelves.

Stopping the Leaks in Wornout Tires.

The second floor houses the vulcanizing plant. The floor is kept clean and the room is light. The third floor contains more stock and two great bins of scrap rubber. This is clean and kept sorted. In many places the scrap rubber shoes left in the shop are disposed of by the "boys" to passing junk dealers. You see the old shoes in greasy piles mixed in with other rubbish. Then you don't see them, for they have disappeared. What became of them? No one knows. In Kaough's shop every scrap tube is weighed and entered in a book and sent upstairs to the bin where it belongs. Once a year this is sold at market rates. It is a by-product that means profit.

There is nothing about Kaough's methods or his records that is not simple and direct. Any dealer can employ the same ideas. Any dealer will find that "it pays to know."

STRIKING INSTANCE OF THE BENEFITS OF SALES ANALYSIS

Did you ever analyze your sales? Or, to put it another way, did you ever analyze your customers?

Say you sold a hundred cars last year—who bought most of them? City people or country folks? What percentage did each buy? To what class did most of the city people belong? What are the opportunities for developing that particular trade? What class did the out-of-town buyers come from? Were they farmers or small town folk? What percentage of each? It pays to know. A little study and analysis might show some exceedingly interesting facts.

Sometimes we get impressions that are at variance with the facts. A certain factory was quite convinced that farmers were taking the bulk of its product. They were sure the western farmer was their best and biggest buyer. Everybody in the factory said so. There was no doubt about it. It was their logical market; therefore the market to be cultivated.

One day an analysis was prepared and they were astonished to find that the eastern trade was giving the West a hard run for volume. Impressions vs. Knowledge. Guess vs. Know. The man who made the analysis remarked: "If I had only known that six months ago it would have made a big difference in our showing."

GRASPING POLICY THAT DID NOT ENHANCE REPUTATION

In northern Ontario a certain dealer had a practical monopoly on the gasolene situation in his vicinity. He put the price up as far as he dared—about 40 cents a gallon and no reduction for quantity. During the first month or so this policy did not interfere with his trade and he made considerable money. But after a while some of the car owners in the vicinity got together and bunched their purchases and sent the order to a point some distance away where prices were more favorable. In the meantime, as contract shipments of gasolene began to arrive for the "near-monopolist," he quickly saw the advisability of fair prices and quotations on the precious fluid came down to normal. No one in the vicinity, however, is praising the dealer for his generosity.

What a pleasing impression is made by the garageman who, after filling up your tank, turns to you and says, "Don't you need some oil?" It is one of the simplest forms of salesmanship and one of the most neglected. The dealers who cultivate this spirit in their employes are sure to find it profitable.

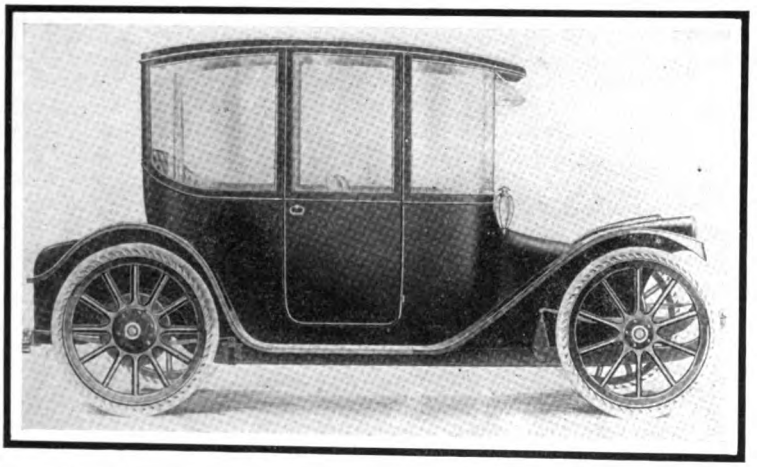
CENTURY CAR CONTROLLED THROUGH MAGNETIC SYSTEM

Duplex Steering and Speed Regulation by Finger-Lever or Pedal—New Car on Old Lines but Enlarged and Improved.

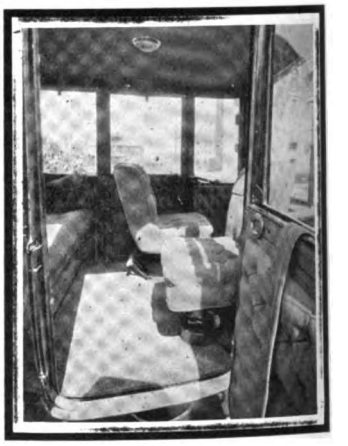
It needs a good deal more than detail changes, however important, to so alter an automobile that it cannot be readily recognized by those who know the characteristics of the make, for each builder puts into his cars certain individual touches that are not easily rubbed out unless there is a complete change of general design. Therefore, it is quite logical that the latest five-passenger electric brougham of the Century Electric Car Co., of Detroit, should be a typical Century car, despite the improvements that serve to make it more comfortable, more easily controlled and withal more pleasing to the eye. The price has been increased from $2,550 to $3,250.

Perhaps the most striking of the new ideas incorporated in the machine is the duplex control and its details. Not only can the car be steered from either the front or the rear seat—on the left side—but the control of speed and of the brakes can be effected either by hand or by foot, as may be desired. The controller is of the magnetic type, and as the real work of operating the controller is performed by electricity, the driver has only to move a little lever which can be shifted with the thumb and finger while the arm rests comfortably on the upholstering.



Foot control is vested in a pedal which is pushed forward to reduce speed. After the pedal has been pushed past the lowest speed point it cuts off the current and successively applies a dynamic (electric) brake and a friction brake; allowed to return, the brakes are released, the current turned on and speed increased to the maximum, which is reached with the pedal at the end of its backward swing. There are no resistances to waste current, and the action is smooth and easy, no matter how fast the controls are operated. Incidentally, the steering lever not in use drops to a vertical position, out of the way. The steering shaft turns in imported ball bearings, eliminating wear and looseness.

The whole car is considerably bigger and roomier than its predecessor. As a starting-point the wheelbase has been increased from 98 inches to 104 inches and the body correspondingly lengthened and the stress-resisting parts strengthened. The rear seat is 50 inches wide, which is 3 inches better than before. The seat is 20 inches wide, with cushions 8 inches deep. The two front seats each are 18 inches wide and 19 inches deep. Doors are 26 inches wide, providing an easy entrance.



A new item of equipment is the Timken axle outfit; the rear axle is of the full-floating type and the front axle a standard I-beam member instead of the tubular front axle formerly used. The brakes are much larger than formerly, commensurate with the present size of the car, being 15 inches in diameter instead of 12, and 2½ inches wide instead of 1¾ niches; the total braking surface is now about 400 square inches. The front springs are semi-elliptic and the rear springs of the platform type; the frame is underslung in front and at the rear is carried above the axle by means of a high "kick-up" which allows easy access to the axle.

Power is generated by a single motor of 500 per cent. overload capacity carried on a three-point suspension and is transmitted to the rear axle through a direct single reduction drive without chains. Current is supplied by a battery of the high bridge type, requiring no washing out, accessibly housed at front and rear, there being no cells under the seats. All the wiring is protected by conduit and is large enough to carry the heaviest currents the motor can draw without appreciable drop in the voltage and without the slightest tendency to heat up.

The tires, which are Motz notch treads 36 x 4½, are half an inch larger than in the previous model. Needless to state, the equipment of the brougham includes electric lights; the headlights are built into the fenders and the side lights are of special design. Tail light, meter lamp and a cut-glass shaded dome lamp with switch on the door complete the illuminating equipment.

CENTURY FIVE-PASSENGER BROUGHAM SHOWING UNDERSLUNG FRONT

SHOWING SEATING ARRANGEMENT

Other items included in the "fittings" category are Warner speedometer, with Pellam floating drive, rim-wind clock, Klaxet horn, flower vase, toilet set, smoking set, Yale control and door locks and the usual charging plug and outfit of wrenches and other tools.

Has "Lightning Conductor" for Cars.

One of the queerest of the many queer inventions that the automobile has inspired was that of a man who became convinced that much motoring produced a nervous disorder of the human mechanism, and that the immediate cause was electricity generated by the vibration of the car and prevented from escaping by the insulating qualities of the rubber tires. The "invention" comprised a conductor which brought the body of the car into continuous electrical connection with the roadway, thus permitting the escape of the nerve-wrecking currents. Application for a patent was actually made, though it is not of record that the inventor acquired inordinate wealth by the sale of his device.

"USED CARS" AND SQUARE DEALING WITH PUBLIC

Expert Sums up His Impressions Gained Through Long Experience in The Trade—Making Used Cars an Asset, Not a Burden—Methods Which Undermine the Future and Their Fallacy

By CLARENCE H. HILL, Manager of the Used Car Department, Detroit-Cadillac Motor Car Co. of New York.

It makes some of us who have been identified with the automobile trade for years smile when we hear the expression "used cars," as it is our old friend the second-hand car posing under a new and apparently more inviting name. It would seem to me more appropriate to use the expression "used and abused cars." The automobile trade at large seems to be devoting about all its spare time to the subject of disposing of its own or of its patrons' used or, if you please, abused cars. Expert opinions are sought, papers are read at various trade meetings, trade journals are devoting much space to the subject, salesmen to run used car departments are hired and fired, and when all the flurry and bustle is over, the dealer fortunate enough to have disposed of his used and abused cars by hook or crook pats himself on the back and exclaims, "What a great man am I!" and considers himself a clever business man; but in the majority of instances he is far from it. He has placed what he considers a very objectionable part of his business in the hands of a glib talker whose motto is, "Slip them over and let tomorrow take care of itself," with the result that in his wild desire to turn into profit his used and abused cars, regardless of their future worth, he has sacrificed his most valuable asset—his reputation. The cars have been disposed of regardless of merit and he has rapidly accumulated a lot of dissatisfied customers ever ready to knock him and the car he represents.

What to Do With Citrus Fruit.

In my opinion any dealer representing a reputable manufacturer, with the aid of a good, clean-cut automobile man in charge of his used car department, should find that this department is a valuable asset and not a constant worry. He should consult that department as to the trade-in value and not embarrass it and his business by over-valuation in his desire to sell cars. If the condition of the car justifies putting it in good condition, the work should be done and the dealer should stand back of it; otherwise, the car should be disposed of through other channels known to the trade; a dealer should never saddle a customer with a "lemon." This has been the policy of one of the most prosperous agencies in this city, and some of its strongest supporters are numbered among the purchasers of its used cars.

Relative to the subject, it strikes me that a little dissertation on business-like methods would not be amiss. I am anxious, if possible, to convince you that the selling of used cars is not only an easy problem, but, if properly handled, a profitable business. The average automobile dealer seems to have a mistaken idea as to just what the word business means. He seems to think that it means to get all the money one can in as short a space of time as possible, and allow the other fellow to do the worrying. The definition of business from any good business man's standpoint is the selling of an article of merchandise to the complete and entire satisfaction of the buyer and seller. Any man with a fair amount of brains, of good appearance and a glib tongue can sell an automobile to the satisfaction of a customer at the time, but it requires good business methods permanently to satisfy the customer and the company.

Agents Good and Otherwise.

It would seem appropriate to quote a trade slogan made famous by John Simmons of the Simmons Hardware Co. of St. Louis: "The recollection of quality remains long after the price has been forgotten"; and it would be well for every automobile dealer to have this before him, not only when he negotiates for a manufacturer's product, but when he actually disposes of that product.

I firmly believe that the chief trouble in the automobile business is in the radical departure made by many of our automobile manufacturers in the selection of agents, as compared with the old-time methods rigidly adhered to by prominent manufacturers in other lines who invariably place their products in the hands of reliable representatives. Many excellent automobiles have been placed upon the American market, designed by capable men, assembled and tested by expert mechanics, but delivered to agents whose mercenary and unbusiness-like methods have done much to embarrass the manufacturer in the eyes of the purchasing public. Consequently, I believe that I am not far wrong when I dwell particularly on the word business as being, I think, the keynote that will not only bring the used car problem out of the mysterious haze, but will bring the automobile industry generally up to a standard where honest manufacturers are striving daily to establish it.

Throwing Light on a Failure.

As an apt illustration, in the year 1905 there arrived in this city two men, whose style and physique reflected their characteristics. One was crude and of no executive ability, but gifted along mechanical lines. The other was the dominating spirit, overloaded with self-confidence, clever, shrewd and a man with the get-rich-quick fever running in his veins. These two men managed to scrape together about $5,000 in cash and started what was known then as the game, which in this instance was the manufacture of automobiles. In 1905 their sales were less than 400; in 1906, about 4,000; in 1907, about 40,000; and, based on that enormous production, one of the largest industrial combinations of its kind in the world was formed. A great splurge was made, but there is no need of going into the details; everyone heard the crash; something like $10,000,000 lost; and the amusing part of it was that one of our New York dailies in printing their obituary dwelt to great length on the condition of the stock market, the inability to obtain funds owing to the stringency of the money market, etc.; and near the end the obituary stated: "The probable cause of the failure of this company was the poor handling of the used car department, as the inventory shows about $200,000 worth of second-hand cars on hand." I predicted their failure in 1909. My predictions were based on the manner in which they were doing business. They were violating the laws of compensation. In other words, they were asking the public to do what they would not do themselves, and, sooner than they expected, the crash came.

This company, as well as several other automobile manufacturers, in response to the demand for four-cylinder cars, turned out in 1906 a four-cylinder model which they

Digitized by Google

knew was not a success; but, nevertheless, they marketed 35 of these cars when any good business man would have consigned them to the junk heap rather than jeopardize his business reputation by having these cars in the hands of his customers. While the company no doubt felt it was riding on such a high wave of prosperity that the 35 failures would soon be forgotten, they were not. Shortly after that the company accepted in trade one of these failures in an effort to satisfy a customer. They proceeded to dispose of this turned-in failure, and were successful in selling it to an unsophisticated purchaser and felt very much elated; and I have no doubt when the unfortunate man drove the car out of their salesroom he was laughed at as an "easy mark." To record the troubles this purchaser had with the car would prove boring, so it is sufficient to state that it cost him $800 for 800 miles of service. This expense included the replacing of five flywheels.

Making Good When Cars Went Wrong.

In the course of business I met this unfortunate purchaser, and he talked with me on the subject of suing the company, saying that he had good grounds for suit, and that he had conferred with several experienced lawyers; but I advised him not to do anything until I looked into the matter. My reason for giving him this advice was based on the experience of another company with which I was familiar. This company had turned out a model that did not come up to its standard; but unfortunately, before stopping deliveries, about 12 of these cars were in customers' hands. The company at once notified these owners that they would exchange the cars for other models at no cost, and, in fact, made exchanges for every car delivered. In one instance they were a matter of nearly two years in locating one of these models, but even then they furnished the owner with a new model.

In consequence, I took it upon myself to interview one of the officials of the company first spoken of, not that I thought I had any influence, but because I thought I could appeal to his business sense and convince him that his customer had every reason to expect fair treatment. I called at the magnificent offices of this large motor company, and after a long wait was ushered into a sumptuous office and found myself in the presence of the Grand Mogul. I stated my case with scant courtesy, and virtually was told that it was none of my business. Evidently the ethics of the case, so far as his company was concerned, he considered a joke.

It was not more than six months after that the company failed. In my estimation it would be hard to find a better illustration of the disastrous effect of ignoring good business methods and resorting to get-rich-quick methods. So far as the used car problem is concerned, handle it in a business-like manner, play the game fairly, and you will not have nearly the problem you imagine.

Used Car Plan Aptly Illustrated.

In the matter of the value of used cars—that is, the valuation as the dealer sees it and not as the customer sees it: In the first place, never blame a customer for asking the highest price for his used car. Blame yourself if you pay more than it is worth. Do not get discouraged if you have to turn down three out of five new car orders on account of the dissatisfaction in price for the prospect's used car. In the first place, a good plan to follow is to specialize on the car or cars you are representing, and not to accept other makes in trade. Stick to one line, both in new and used cars, and do not be governed by your competitor's price or by what the customer says he can get. For example: Assume that you are selling exclusively the Jones car; that you have been handling this car for several years and that it is popular and well-constructed; that your customer is interested in the 1914 model and that he owns a 1912 model. The demand for a 1912 used car does not justify you in allowing more than $800 in trade. The customer is dissatisfied and informs you that the agent for the Smith car has offered him $1,000 in trade. It is not necessary to go into details with your customer, except to inform him that if you could afford to allow him $1,000 for the car you would have told him so in the first place. Allow the man just what the car is worth as a business proposition, and not one penny more.

Every Used Car Buyer Made a Friend.

Overhaul the car and put it in good condition before disposing of it. You will find that you can invariably do this at a cost that will permit your disposing of the car for an amount equal to, if not less than, the amount of $1,000 allowed by Mr. Smith. On the other hand, if Smith disposes of the car for just what he has allowed, he will create a dissatisfied customer; or, if he attempts to overhaul it he would only be able to get the market price—which we will say in this instance is $1,000—and in disposing of the car will do so at a loss.

I have been following along these lines for the past six years, during which time I have sold only one make of car. In the past season I have sold over 300 used cars, and I believe I can honestly state that I have made a friend of every customer. I attribute my success—if I may be allowed to call it success—to the fact that the head of the company with which I am affiliated is in strict accordance with my ideas relative to the used car problem.

Lower Freight Rates in Western Territory.

After November 1st the rate on automobile tire chains in barrels or boxes in Western Classification territory will be reduced from first class, less than carload, to second class. Wind shield frames, less than carloads, will also be reduced from double first class to first class rates. Tractor attachments for automobiles, loose small parts in boxes, and trunk racks in boxes or crates on which no specific rating now exists, will bear first class rate, while automobile tire carrying cases in boxes or crates will be charged double first class.

Want Salesman to Repay Expense Money.

Edward J. and Leo A. Brigel, who operate in Cincinnati, Ohio, as the Selden Auto Agency, advanced some expense money once upon a time to James A. Duchemin, a salesman, so they claim, and now they want it back; until Potash and Perlmutter of Georgemcohan-Montagueglass fame, they are unwilling to let the money go and have filed suit against Duchemin in the Court of Common Pleas in that city for $762.50.

Haynes Manager Starts on Trade Swing.

A. G. Seiberling, general manager of the Haynes Automobile Co., is due to leave the factory in Kokomo, Ind., for a swing around the entire trade circle. This means, of course, that he will go as far as the Pacific Coast. Incidentally, it is announced that the Haynes output for 1914 has been entirely contracted for by dealers.

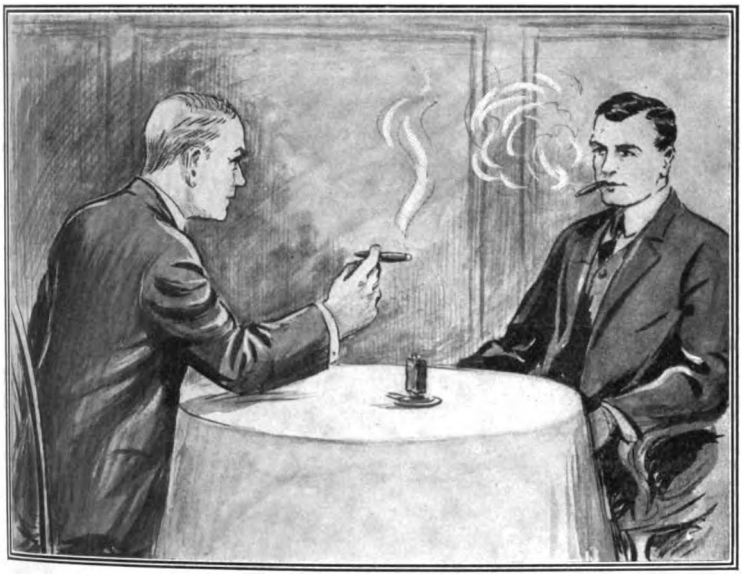
Case Takes Over Alco Salesrooms.

The two-story building at Broadway and West 62d street, New York City, formerly occupied by the automobile sales department of the American Locomotive Co., has been taken over by the J. I. Case T. M. Co., of Racine, Wis. The building affords 20,000 feet of floor space and will be occupied by the Case New York branch.

Pennsylvania Buys into Hatfield Truck.

W. C. Riley, president of the Valley Iron Works, of Williamsport, Pa., has acquired a large interest in the Hatfield Co., which manufactures the Hatfield truck in Elmira, N. Y. Reports that the factory will be removed from Elmira to Williamsport are, however, denied.

Head of Lozier Company Off for Paris.



Harry A. Lozier, president of the Lozier Motor Co., sailed to Paris this week. He will be absent for a month or more.

AIDING SALESMEN ON PATHWAY TO EFFICIENCY

Put Uplift Reading Where it Is Within Their Reach That They May Gather Inspiration—Reilly Convinces a Doubting Tradesman of the Value of Books and Trade Papers to Salesman and Dealer, Too.

In their favorite corner at Pierre's, Reilly and Ben Doyno sought comfortable places for their feet under the table and, straightening back in their chairs, fished cigars from their vest pockets; Reilly's was long and black and Doyno's was long, too, but it was less corpulent and more on the

"IT'S A QUESTION OF EDUCATING YOUR SALES FORCE," WENT ON REILLY

octoroon style. Frank, who was a truly good waiter, knew this was the psychological moment and dexterously brushed off the table top, snatched up the few remaining dishes and set down a couple of ash trays.

Reilly and the Psychological Moment.

Doyno, who was one of the town's successful supply men, did not know Tommy Trumbull, and Reilly sat so he couldn't see him. Tommy had graduated from college June with the determination to be a salesman and, since he couldn't land in Reilly's salesroom or get anything else that he thought was what he wanted, had started out on a free lance expedition of his own. He hadn't been a salesman long, but he knew Reilly and also knew this was the psychological moment for him.

As Tommy out of the tail of his eye saw Reilly spread the first satisfying cloud, the youth arose from his nearby table and walked over to the two tradesmen.

"Well, well! Hello, Tommy!" greeted Reilly. "What are you doing these days? Haven't seen you in a long time."

For answer Tommy reached inside his coat where a concealed black bag hung over his sholuder, drew out a thin, gray book and laid it on the table. He said nothing.

"Pretty clever! Pretty clever!" exclaimed Reilly as he pulled back Tommy's coat and peered at the hidden bag which enabled a book agent to look like a perfectly respectable citizen.

"Sales—and Their Making," was what Reilly read on the cover of the book as Tommy still stood beside him in silence. Reilly looked inside, turning critically through the attractively compiled pages of the prospectus. What he saw told him what the book was, and Tommy knew this would make more impression upon Reilly than a rod of verbal argument.

Doyno Declines to Invest in Ideas.

Just as Reilly was glancing over the last few pages Tommy laconically said, "Two dollars. Deliver in two weeks." For answer Reilly drew forth $2. Tommy handed the prospectus to Doyno, who laughed, "I'll let Reilly read it and then listen to him tell about it. That'll save me $2."

Tommy laughed, too, and walked out.

"Looks like a good book, Ben," commented Reilly.

"There are millions of good books; I can't buy them all," was Doyno's response. "Also, two dollars is sixteen bits, and bits don't grow on bushes."

"May be." Reilly shrugged his shoulders.

"What are you going to do with it after you get?" challenged Doyno.

"Do with it? What do you generally do with a book?"

Attic not the Place for Such Property.

"That sort of bunk you generally put in the attic."

"You do! Well, I don't. I'll read it and my salesman will read it. You may be a good enough salesman or businessman, but I don't think it would hurt you to have some stuff like that around your place for——"

"To amuse the salesmen?" interrupted Doyno.

"You're like a lot more," retorted Reilly. "You can't see any good in such stuff. If you could buy for $50 a display window idea that would give your store a good boost, would you buy it?"

"Certainly, I would!"

"If one of your men or yourself could get it for $2 would you consider it a good investment?"

"Certainly."

"Why, then, do you stick up your nose at a book that is full of ideas, any one of which might be worth to you many times the value of the book?"

"A-a-g-h!" grunted Doyno, "it sounds well."

Supplyman Undervalues Ideas' Source.

"That's the trouble with a lot of you fellows," continued Reilly. "You persist in walking all over the things that would be valuable in your business and can't see them or pick them up because you're stepping on them. That book is worth many times what it costs if it is used right. But you've got into a rut of prejudice, and just because a book agent came along with it you won't even look at it."

"I hate the sight of a book agent."

"The book agent part doesn't loom up strong at all in this matter. He hasn't anything to do with it," went on Reilly, who

Digitized by Google

was leaning forward with the hot end of his cigar pointed at the passive and unperturbed Doyno. "It applies in more ways than one; it's a question of educating your sales force and giving them a chance to get ideas that may be valuable in your business, and you sceptical individuals are turning opportunity down cold at this point. It is impossible to estimate the value of the right kind of literature when placed in the hands of clerks and salesmen; maybe you don't realize that every time one of your salesmen betters himself a little he is benefitting you directly, but he is."

"Haven't your salesmen anything to do but read books?"

Why Spare Time is not Easily Avoided.

"Yes, they have! Sometimes and sometimes not," returned Reilly. "There isn't a salesroom in this or any other town where there aren't times when salesmen have idle time on their hands. They may not so classify the moments when they are sitting on floor duty waiting for someone to come in or just waiting for something to fall into their laps; but there isn't a salesman who doesn't have some spare time even when he is on duty. I know that my salesman often has times when he isn't overworked. It is no discredit to him, either; it has to be.

"Now, supposing that book I just bought is lying around the office—as it will be when I get it—and the salesman picks it up some day and looks it over. He is very likely to run across a selling idea that never came to him before, and if he puts it into practice isn't that one idea worth $2?"

"Yes, Reilly, that's all right, but how much is there in that book that you don't know this minute?"

Dormant Ideas Bad as None at All.

"For the sake of argument we will say I know it all. We may also concede that the salesman knows all there is in it, too, but how many ideas are there which are not exactly new with a man but which have merely been allowed to shuffle back into the attic of his brain and which, therefore, are the same as something he never knew at all? This sort of reading, Doyno, is valuable in more ways than one. The habit of reading this efficiency and uplift stuff arouses many dormant ideas that have been lost in a man's mental storehouse.

"You can see how that is yourself. Suppose you note down a good idea every time it occurs to you, which is a very good plan. But suppose that you file all these ideas away in a drawer or a book and don't look at the book; what good are the ideas? But —suppose you take out the collection and thumb it over every so often; doesn't that make those ideas a quick asset, something that has a real value? And what's the difference between that and reading business and efficiency literature? You may have known it all beforehand, but it wakes you up and buys back forgotten ideas."

"There's some sense to that argument, Reilly."

"And, lest you think I am in favor of buying a stack of books for the use of the sales force, let me make this an opportunity for saying that there are other things than books. There are efficiency magazines and dealers' trade papers. All of these things have some good in them.

"Furthermore," asserted Reilly with emphasis, "it's good policy to push these things under the noses of your salesmen, to leave such books and trade papers lying

"YOU MAY STAY FOREVAIRE!" EFFERVESCED THE FRENCH PROPRIETOR

around where they can't help but see them. Don't give them a chance to say they never get a chance to get hold of them. This has two distinct benefits for the dealer or any other employer of salesmen. It gives the dealer a line on who of his salesmen are the best men and the most interested in the business. The interested man will read such things; he is hungry for them, for he knows they will increase his efficiency. It gives the dealer a basis for weeding out the men who are the least valuable and for developing the men who show the greatest promise. It's a sure criterion.

How Reilly's Plan Helps the Dealer.

"Also, assuming that it shows who the interested men are, it also helps the dealer's business in making his good men better. The interested salesman ought to show results and this one little plan can be made the means of building up a selling system of greatest efficiency. If I had to choose between two men I would pick the man who read his trade papers every time. I would have no hesitation in doing so.

"The situation was brought home to me some months ago when two copies of a trade paper come into the office one morning. One was addressed to the salesman. I asked him about it, and he said he wanted one to read and that I had always taken mine home before he got a chance at it. He said there was good stuff in it for any man in the trade and that he thought there was just as much in it for him as for me. He also said he thought that when all things were considered he needed to read it much more than I did. I think he was right, too. He has been in the selling business a shorter time than I have and is working on a salary and has farther to go than I have before he gets where he wants to be.

Floor Plan from Efficiency Reading.

"My salesman is eager to read that kind of stuff, and the results have been apparent on more than one occasion. I don't remember just where he unearthed it, but he is responsible for a scheme of floor arrangement for cars that has proved especially attractive and effective. I remember he told me at the time that he read something of the principles of window arrangement and lighting in something or other and that gave him the germ of the idea which he proceeded to work out for application to our salesroom.

"I had always realized that the job could be better done in some way, but I never found anything that seemed to be just what I felt could be accomplished. But he figured it out. That is but one instance in which the use of this sort of reading by a salesman has been productive of good results. Had he not read it, we might never have become possessed of the display scheme. How much did that cost us and how much is it worth? Come on, now; how much?"

Hard to Place Value on the Result.

"That's hard to tell, Reilly. It's worth a great deal."

"If the book I have bought can do a fraction of that amount of good isn't it worth two dollars?"

"Probably it is."

"How many two dollars do you let dribble through your fingers with never a thought? Yet when a man asks you point blank to spend that amount of money the matter assumes entirely different proportions and you at once develop an economical streak."

"For economy I would suggest that we get out before Pierre charges us rent for this place," commented Doyno. "Eh, Pierre?" to the proprietor who was passing in his hurried French way.

"You may stay forevaire!" effervesced Pierre, whose little round mouth and uppointed moustache looked for all the world like an old spread eagle flying away with a young doughnut. But Reilly and Doyno went.

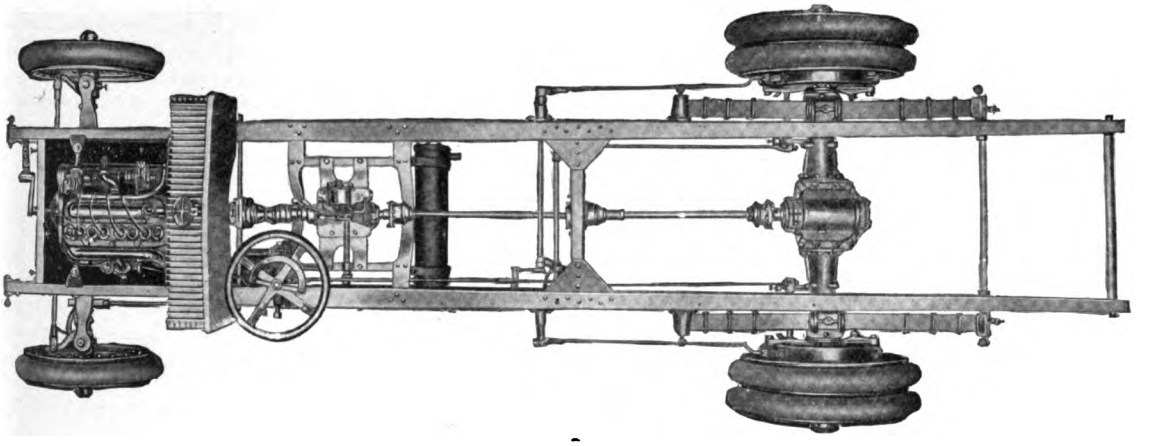
ACCESSIBILITY FEATURED IN WORM-DRIVEN LIPPARD TRUCK

Everything Easily Get-at-able in New Model Rated at One and One-Half Tons Capacity—Unusual Propeller Shaft Construction.



Departing by a considerable margin from previous practice in some respects, most important of which is the adoption of worm drive, though still retaining a great many of the distinctive features of its older, 1,500-pound delivery wagon, the Lippard-Stewart Motor Car Co., of Buffalo, N. Y., has in its latest model, which is rated at 1½ tons capacity, given ample evidence of well-laid plans for the maximum of accessibility; the list price of the new model chassis is $2,300 and bodies to suit the individual requirements of the purchaser are quoted separately.

As is customary in a great many of the lighter commercial vehicles, the motor in the new model is placed forward of the driver's seat under a sloping hood where it is instantly accessible for adjustment or the replenishment of oil. Furthermore, each unit in the chassis is independent of the others and can be removed without disturbing them. Due to the clean design of the engine, the magneto and the carburetter are readily detachable and within easy reach; both the clutch and the gearset are accessible through floorboards and either can be taken out bodily without removing the other. The underpan is held in place by means of a clamp and wing nut and, when necessary, can be loosened and pulled forward along the frame so that the lower half of the crankcase is exposed; when the pan is detached, the bearings are within easy reach. Throughout the car, oiling devices are used liberally; the spring bolts are lubricated by means of cups and wicks; the clutch shaft and brake counter-shaft are lubricated by liberal sized grease cups which are placed outside the frame, making it unnecessary to take up floorboards or to creep beneath the car to give them the necessary half turn at intervals.

In the construction of the car cognizance has been taken of the necessity for providing ample power, but so that the power cannot be used to disadvantage a centrifugal governor on the motor holds the speed of the vehicle normal. The motor itself is a Continental, which is as good as stating that it has L-head cylinders cast in a block and that the oiling system for which all Continental motors are known is used. Under this system, the oil is forced by two plunger pumps through copper tubes to the main engine bearings and also to the timing gear train. The bore and stroke of the engine cylinders are 4⅛ inches and 5½ inches, and it delivers its rated 35 horsepower at 1,200 revolutions. For ignition, an Eiseman high-tension magneto is employed and so that the driver cannot experiment with the spark advance, there is no advance lever; the ignition is set for a point predetermined by the makers. The carburetter is a Rayfield with a dash attachment to the needle valve for altering the proportions of the mixture according to the requirements of the motor.

For cooling, Lippard-Stewart engineers have adopted the built-up type of radiator as being susceptible of quicker and easier repair than any other type. The water tanks are of cast aluminum, the upper one having cooling flanges cast on it to assist in the radiation of heat. The tubes are fitted into the tanks in such a way that either of two groups can be withdrawn without disturbing the other. Water is circulated by means of a centrifugal pump and a draught is induced through the radiator by blades cast on the periphery of the engine flywheel.

By way of discouraging wear due to hard usage, the clutch and transmission elements have been made unusually rugged, the gearset, for instance, being calculated to transmit 50 horsepower easily. The clutch is a pressed steel, leather-faced cone and the gearset, which bears the Brown-Lipe nameplate, provides three forward speeds and reverse, selectively obtained; the gears have one-inch faces and the shafts are mounted in Timken bearings. Instead of being continuous, the propeller shaft is divided into two sections, the object being to obviate the possibility of whipping. The forward section terminates in a substantial self-adjusting ball bearing carried on a frame cross member. Under normal load, the drive is transmitted in a straight line and when light, the slight angularity of the shafts is compensated for by Spicer universal joints, one of which is placed immediately behind the gearset and one at each end of the rear half of the propeller shaft.

TOP VIEW LIPPARD-STEWART 1½-TON CHASSIS SHOWING WORM DRIVEN REAR AXLE

The axles, it scarcely is necessary to point out, are both of Timken manufacture, the front member being the customary heavy-duty I-beam section reinforced to rectangular section at its center. Wheels and steering knuckles are mounted in Timken bearings, of course. The rear axle, which is of the full-floating type, is encased in a cast steel differential housing which is bolted to two tubular members and strongly ribbed throughout. The worm drive is a David Brown with the worm above the wheel, the former being of bronze and the latter of steel. Timken roller bearings are used throughout and particular attention has been paid the necessity for copious and constant lubrication of the worm parts. Cleaning holes are provided to allow of the housing being flushed out at regular intervals. Both sets of brakes are located on rear wheel drums measuring 17 inches in diameter and 2¾ inches across the face.

The frame of the truck is so arranged that

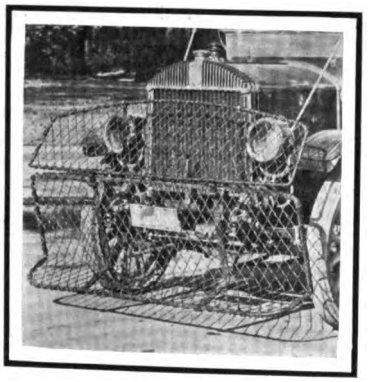
Digitized by Google

bodies of from 10 to 12 feet in length can be mounted without overhang and the optional wheelbase lengths of 145 and 158 inches make it possible to secure a load distribution of 30 per cent. on the front wheels and 70 per cent. on the rear wheels. At the point where the greatest strain comes, the channel section is 6 1/16 inches x 4¼ inches wide, ¼-inch alloy steel being used in both side and cross members. By means of a special hinge connection to the side channels, the front cross member is made detachable so that the motor can be readily removed and slid onto two skids placed in front of the chassis. Two other cross members, placed fore and aft of the gearset, act as supports for this unit. A fourth frame member, attached by heavy gusset plates, is located nearly in the middle of the chassis and a tubular tie rod extends across the frame at the extreme end. In front of the radiator the frame is in-swept to permit of a small turning radius.

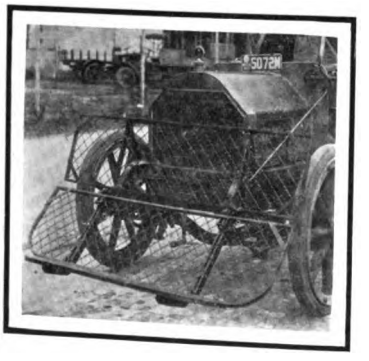
Demonstrating Electric for Touring Use.

The electric pleasure car is rapidly being developed to a point where it can be used for touring at speeds that are as high as are reasonable and with very little loss of time for charging the battery, and an indication of the fact is the run recently made by a Bailey roadster with a 60-cell Edison battery—a stock model with 10,700 miles to its credit. E. W. M. Bailey, who drove the car, made no attempt to cover a long distance on a single charge, as it was unnecessary and, besides, is not considered to be good practice.

The run was significant, however, in that 258 miles were covered on the route from Boston to Burlington, Vt., in less than 24 hours and in a total running time of 13 hours 35 minutes, giving an average speed of 19 miles an hour—no mean gait even for a gasolene car. Some of the roads were in bad shape, and there were many stiff hills. One feature of the trip was that the battery did not get a full charge en route, but was "boosted" at five intermediate points; the Edison battery permitted much saving of time by standing, without injury, charging rates that reached a maximum of 150 ampere-hours, the normal rate being 37.5 ampere-hours. Battery charging at four times the normal rate is not so very far behind taking on gasolene in point of time, all things considered.



College Inaugurates Sales Course.



A course in retail selling has been inaugurated for the coming season by the Extension Division of the University of Minnesota; the sessions will be held in Minneapolis and St. Paul. Recognized leaders in all branches of the retail sales field will contribute to the curriculum.

DETROIT THE FIRST CITY TO INSIST ON FENDERS

Chicago Shows Signs of Following Suit —Detroit Officials Approve Several Types of "Life-Savers"— Fender Inventors Joyful.

Away back in the early history of the automobile, probably when there were no more than a few dozen machines trying to shove themselves along the roads, someone invented the first "life-saving fender" for motor cars, and ever since there have been innumerable genuises keeping up the good work and conceiving fenders of every imaginable shape and sort. Until this year their chances of working up a business in the selling of fenders have been poor, to say the least, for there are few who would care to decorate their machines with fenders, if they had their own way, even if the appliances were presented free, gratis and for nothing and applied to the machines without cost.

THREE TYPES OF APPROVED FENDERS

The city of Detroit, however, has come to the aid of this persevering class of inventors by ordaining that all commercial vehicles within its confines must be equipped with fenders, and there is still further hope in the fact that Chicago is considering the adoption of a similar regulation. While the owners of trucks and delivery cars cannot be said to be particularly enthusiastic, those who do business in Detroit are bestirring themselves, for they must build front porches on their cars, so to speak, or else suffer the prescribed penalty. And all fenders must be of such types as are approved and passed by the city officials charged with the enforcement of the new regulation.

At first there was much comment concerning the fact that no inkling was given as to what kind of a fender would suit the powers that be, or, for that matter, as to what fenders could be had; but the situation has been somewhat relieved by the examination and approval of several types of fenders, three of which are shown in the accompanying illustrations. One important condition is that the front bar of the fender shall not be more than 6 inches from the ground when the truck is being operated on the street—a condition that is not quite as simple as it sounds.

New Law Requires Rest for New Yorkers.

Employers in New York State who require their workmen to labor more than six days per week must now resort to considerable red tape to keep their skirts clear of the one-day's-rest-in-seven law which went into effect on October 1st. The law is designed particularly to affect workmen in shops and mills, one of the several classes of labor to which it does not apply being chauffeurs, according to the interpretation that just has been rendered by the Attorney-General.

One provision of the new law specifies that before an employer may operate on Sunday he must post a list of employes designating the day of rest for each, and file a copy thereof with the State Commissioner of Labor. Each employe also must keep a time book, showing, among other things, the number of hours he works on each day.

ADMITTING THAT PROSPECT HAS INTELLIGENCE

Too Emphatic Assertions by Salesmen May Be Unfavorably Regarded by Buyer—Dealer Who Says, "Prospect Will Use Own Judgment, Anyway, so Why Not Turn This Into a Selling Point?"

Assuming that a man has started in on a "shoestring" and has amassed money enough to own a high-grade car and has built up a business of which he is the head, he is naturally expected to have some intelligence.

Should a man attain average eminence in the law or any other profession, or should he be just an ordinary human being who has to date escaped incarceration in an institution for those of unsound mind, it may be assumed that he is not entirely devoid of intelligence.

Why Conceal Fact from the Prospect?

Having established this premise, Glenn A. Tisdale, who heads the Franklin Motor Car Co., of New York City, says: "Then why attempt to conceal the fact from the prospect? Why not admit that he has intelligence?"

The average salesman, at this remark, may scratch his head and wonder when he ever said that the prospective buyer of a car was less intelligent than the man who was trying to sell it. He may not be able to recall a single instance, but Tisdale is able to recall numerous instances of how conceding that the prospect knows at least a few things in the way of general knowledge has helped make sales.

To go further in explanation, it may be stated that the denial of intelligence in a prospect is not an abrupt assertion of "I know more than you do," or "You don't know anything," but is best described as an attitude on the part of many salesmen which may easily be interpreted by the prospect and resolved into an expression of the prospect's inferior knowledge.

Too much assertiveness on the part of the salesman is directly the cause of the practice which this dealer seeks to avoid, and the logic of the contrary method is explained by the statement that the prospect should be convinced that a car is "right," not bullied into buying it because the salesman declares that it is "right" and does not even admit that there is any argument to the contrary.

"I believe that that one thing has helped influence as many of my sales as has anything else," said Tisdale. "I don't pretend to be a top-notch salesman; in fact, I'm learning every day, and there's a whole lot that I have to learn yet. But I do make a sale now and then, and I can look back to many of them and see where and how the admission that the buyer had intelligence and knew more about what he wanted than I knew, has helped get the order. I believe one of the greatest things in selling cars is to be frank with the buyer and make him believe you are frank and honest with him; if you do that you cannot help but admit that he knows something about the subject, for down in the bottom of his heart every salesman knows it is true.

Buyer Generally Knows What He Wants.

"When a man is in the market for a car he generally has an idea of what he wants and is better posted on that point than I am; wherefore, why should I rise and declare to him that he doesn't know what he wants, that I do know what he wants, and that I have the very thing he wants? If he has any brains at all—and most men who buy cars have some—he immediately becomes prejudiced against what I have to sell. I have given him no honest arguments, but have merely asserted that such things are so-and-so and must be so because I said so.

"But if I can lead him through what I have to say, admit that he is right in his views, that he knows what he wants and then make what I have fit in with the mind picture he has of a car, or so change his mind picture that it fits the car, he is more likely to buy, I believe, than if I try to tear down his mind picture and reconstruct it against his will. And above all things I try to be frank and honest.

When Concession by Salesman Won Out.

"One sale in particular was made in this way. We may as well call the man Smith. Smith came to me and asked about a car, and I told him something about what I could do for him, but he was a man with an assertive disposition and he wouldn't for a minute stand being flatly contradicted. Had I taken him around the floor and insisted that I had what he wantetd he probably would have made up his mind firmly that I was wrong and he might never have come back.

"But he revealed his disposition and I went over to his side of the argument, and, truthfully, too, admitted that he knew much better than I did what he wanted. I told him he probably would be satisfied with one of our cars after he had given it a tryout, but I said, 'Now, see here, Smith, you know better than I do what you want. I'll tell you what you do. You look around a little and come back and let me know how you come out. Then I'll show you what I've got, and if by then you haven't found what you want I'll take my car and I'll go with you and help you find what you want if we have to hunt a week.' This sort of proposal appealed to Smith, and he at once evinced an interest in our cars. The interest became so keen that he parted with good money for one and he never has regretted it.

"Another man came in one day to get an

Digitized by Google

and down the 'Row,' that was plain to be seen. I knew that if I told him about what we had he would merely file it away in his mental card index along with the other information he was collecting, and I doubted much if he would consent to a request that he take a demonstration. I told him as I had Smith, 'Talking won't show you what the car can do and doesn't mean much to you. You know what you want better than I do. I would suggest that you take a ride in a car, see exactly what it will do, and if you don't want it I don't want you to have it. Unless you really want one of our cars I would rather not sell it to you.'

"Shopper" Who "Shopped" No Further.

"He consented to go for a ride, and the demonstration convinced him that the car was satisfactory. It was more effective than a week's talking would have been. When he came back he was ready to buy and left his order. It may sound inconsistent, but I really meant what I said. If a man doesn't want our car I don't want him to have it. There is nothing that I regard as so damaging to a dealer's business as to have a car in the service of a man who bought it against his will and best judgment. Of course, the dealer's business is to make him want it—not sign the order, but want the car.

"When the company recently decided to drop right-hand drive, adopt left-hand drive and build one chassis only, it left me with several cars on my hands at the time the announcement came out. A prospect was in my store looking at one of the last series right-hand cars and was quite favorably impressed with it. I couldn't conscientiously sell him that car without saying something about the new series left-hand cars which was coming.

Fairness in Meeting Change of Series.

"I explained the whole situation as it stood and told him all the advantages I knew of for right-hand drive. Then I said, 'Now, you may not like a right-hand drive. A little later we are going to have some left-hand driven cars. I never have driven a left-hand drive'—which was a perfectly true statement—'and cannot tell you as much about it as I can about a right-hand drive. I really don't know which I like the best.' But before this I had enumerated all of the advantages of right-hand drive, and they were fresh in his mind. The man seemed impressed by the fairness of my statements. Also, he wanted his car as soon as he could get it, and he said he didn't think he cared which drive he had. By honestly presenting the right-hand driven car and then submitting the proposition to his own judgment with the statement that he knew what he wanted and would have to make the decision himself, he was helped to decide the way I wanted him to.

"There were two ways out in that sale. I could have sold him the right-hand driven car without saying anything about the new left drives, or I could have done the way I did. I don't think the former way would have been fair to either of us.

Truth Best in Cases of Follow-up.

"Maybe it's similar to telling the prospect he can have his own way in the sale, which is not bad, in my estimation. When a man comes into the salesroom I at some time hand him my card and generally he will offer me his in exchange. Sometimes we ask a man if he doesn't want to leave his name with us, and, in either case, the prospect often says he doesn't want to do so because he doesn't want a salesman to annoy him. In every case, however, we make plain to the prospect that unless he gives us permission to see him no one will go near him; and we always keep that promise. If a man does leave his name with the understanding that he is to be seen only upon the arrival of some model in which he is interested and which was not on the floor at the time he called, we endeavor to respect his wishes.

Lead, Not Push, Prospect Over Line.

"At all times we endeavor to impress upon the prospect that we are anxious to please him in every way. We leave it to him as to whether he wants the car, but that doesn't prevent us showing up the advantages of our line. If we make a strong presentation of our product and then leave it to his judgment, he is more likely to buy then if we make the presentation and then try to push him over the line. What's the difference? There's nothing lost. No matter which way it comes out, nine out of ten —or maybe a larger percentage—will use their own judgment anyway, so why not let them know you know it and make that a selling point? In fact, that appeals to me as one of the best ways of leading—not pushing—the average prospect over the selling line."

Apropos of the sale in which Tisdale had said he would take his car and help the prospect find what he wanted, the Motor World man asked, "But would you have done that?"

Giving Ring of Truth to the Story.

"Certainly I would!" shot back Tisdale. "I said I would and I would—but I didn't have to. I don't believe in telling a prospect things that aren't true. If there are things in your selling talk which you wish the prospect to accept without a detailed idea of what we had. He was shopping up array of proof, he is much more likely to believe those things if he finds you are square with him in other things. Frankness is a big asset in making your story ring true.

"When a salesman makes statements to a prospect and is very assertive, the prospect often takes them with a grain of salt because of the salesman's cock-sureness. The story does not ring true. It sounds too much as if the salesman were trying to sell the prospect something. Apt expressions and catchy phrases may make a fine selling story and many a salesman is congratulated upon the fine selling talk he can give, but I would rather not have a prospect tell me I'm a fine salesman; I'd rather that he show his appreciation of my ability with a check. Anyway, if he did tell me, I would take it with a grain of salt. It would strike me as one of those over-assertive statements that don't ring true. I think I'd ask him to produce strong evidence on that point."

Jap Automobile School for Japanese.

What is said to be the only school of automobile instruction in the United States operated by Japanese for Japanese is that conducted by John Oguchi and L. C. Hufford, at 514 West 16th street, Los Angeles. It formerly was operated by A. W. Yaw, but Oguchi and Hufford bought him out, and while they cater especially to their own countrymen they do not exclude Americans from the institution.

The course of study includes the principles of mechanical engineering, making and repairing of all makes of cars, the making of all parts, and all practical instruction necessary to the proper understanding of the modern automobile. Lectures are given in both English and Japanese in these subjects and the study of English for the non-English students is part of the curriculum. About 200 pupils have been turned out during the existence of the school, the greater part of these in the two years since the present management has had charge of the project.

May Have to Letter St. Louis Cars.

Even thought the city ordinances require that all cars owned by the city of St. Louis shall bear upon their sides letters stating to what department they belong, the city officials apparently are much like other motorists in not wishing to disfigure the bodies of the cars in this manner. Attention has been called to the fact that as the cars now stand they cannot be distinguished from privately owned automobiles, and when questioned the various city officials admitted the absence of lettering but said they had never heard of the regulation in question.

REVISED REGAL LINE SHOWS FEW IMPORTANT ALTERATIONS

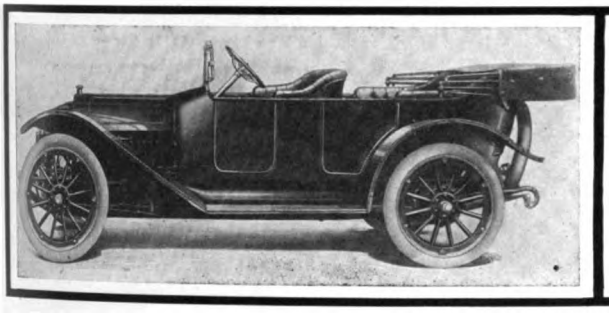
Left Drive Adopted and Rushmore System Added, Together with Complete Equipment—Clutch Release Now Ball Bearing.

Supplementing somewhat abbreviated specifications that were published two weeks ago in Motor World, additional details which now are available concerning the newer series Regal cars, serve only to emphasize what was contained in the first report, namely, that in bringing the two chassis that hereafter will constitute the line more thoroughly up-to-date, the Regal Motor Car Co., of Detroit, Mich., has found reason to make no radical changes and few revisions.

The change in construction most worthy of note concerns the control elements, the steering gear having been shifted from the right side to the left side and the gear shift and emergency brake levers from the right to the center of the footboard. At the same time, the Rushmore electric lighting and engine starting has been made a part of the regular equipment which now is included in the list prices of the various models; heretofore, Regal cars have been listed without equipment. One model, an underslung touring car carrying a 4¼ x 4½-inch motor has been discontinued.

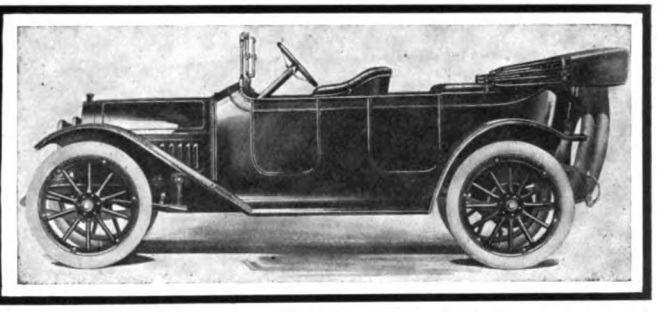
In the two remaining chasses in the line, the mechanical alterations are unusually few and far between and, except for several minor refinements, consist of the substitution of a roller bearing clutch collar for the plain bronze collar that has been used in the past. Under the new construction, when pressure is placed on the clutch pedal, the two annular ball bearings bear backward against the flange on the clutch sleeve, causing the clutch to be disengaged. When the pressure is released, a coil spring holds the bearings free of the flange.

In revising the motors that are used in the two remaining chassis, the Regal engineer has passed his hand but lightly over them and, to the eye at least, the only change apparent is the addition of the Rushmore lighting and starting system. The system, by the way, is of the two-unit type, the generator being separately mounted from the starting motor which drives the gasolene engine through the intermediary of a steel ring gear fastened to the periphery of the flywheel. As already is fairly well known, no mechanical means is used in the Rushmore system to effect the connection between the starting motor and the car engine; the connection is established electrically through the agency of magnetism. The driving gear is fastened to the end of an endwise moving armature shaft and instantly the starting switch is closed the shaft moves endwise, drawing the gear into mesh. When the gasolene engine has taken up its own cycle of operations, the gear automatically is shifted out of engagement.



Neither the construction nor the measurements of the motors have been changed, the smaller motor, which is carried by all of the underslung cars, measuring 3¾ inches bore and 4½ inches stroke, and the larger engine, which is fitted to the conventional overslung touring car, measuring 4 x 5 inches. In both cases, the four cylinders are cast in a block, with due attention paid to the necessity for accessibility and simplicity.

Change gearsets also remain unchanged and in all three cars are mounted adjacent to the rear axle; they provide three speeds forward and reverse, control being by the usual hand lever. The master clutch is of the cone type with adjustable spring inserts beneath the leather face to provide against gripping.



The clutch is connected directly to the forward end of the propeller shaft through the medium of a universal joint, the driving strain being transmitted through radius rods, the forward ends of which are supported in brackets riveted to the center cross frame member. As heretofore, the propeller shaft is contained in a tubular housing which serves to absorb the torque reaction. The same chassis is used in both the roadster and the coupe model and another chassis exactly the same as the first, except that it is slightly larger, is used for the conventional overslung car. One important change in this car, by the way, is that both front and rear springs have been fastened beneath the axles, making the car virtually a semi-underslung model. The wheelbase of the smaller chassis remains unchanged, as does the wheelbase of the larger one; the former measures 108 inches and the latter 116 inches.

Coincident with the slight mechanical changes that have been made, and the complete equipment that has been added, prices have been raised slightly, though they still hover about the $1,000 mark. In the case of the underslung roadster, for instance, the price has been changed from $900 to $1,125; the price of the underslung touring car also has been made $1,125 instead of $950. The new coupe model, which has lost much of its Colonial appearance and now suggests the more conventional car, lists at $1,600 instead of $1,250; and the price of the overslung touring car has been put up to $1,350 from $1,250.

Bodies, of course, have been included in the revision and this is particularly apparent in the model T touring car which proved so popular last year. Although the wheelbase remains the same, the body has been lengthened and widened; the doors have been made larger and the hinges concealed, and a cowlboard mounting the controls and other instruments added. Equipment in every case includes ventilating rain-vision windshield, top with slip cover and side curtains, speedometer, demountable rims and the usual assortment of tools, spare parts, etc.

STANDARD REGAL UNDERSLUNG TOURING CAR

CONVENTIONAL TYPE OF OVERSLUNG CAR

To Keep Sight Feed Glasses Clean.

The glass tube through which lubricating oil trickles, drips or runs, as the case may be, in a sight-feed lubricator, sooner or later becomes so fouled that it is difficult to see whether the oil is passing through or not. The accumulation of dirt can be greatly delayed by dipping the tube in melted paraffin wax after thoroughly cleaning it.

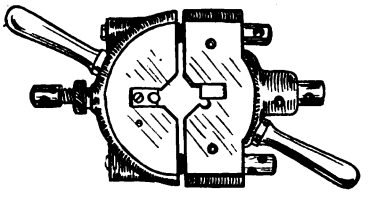
RECENT DEVELOPMENTS in ACCESSORIES

Hand Warmer That Laces on Wheel.

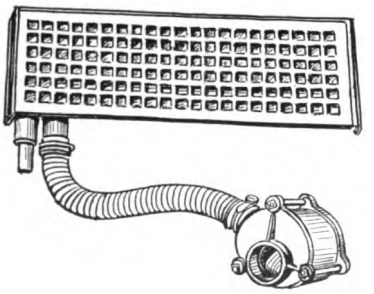
It's one of the hardest things in the world to keep the hands warm on a really cold day when driving a car; more correctly speaking, it is next to impossible to do it with the aid of gloves and the like. Thanks to the ingenuity of the people who are always looking out for methods of making motoring more comfortable, however, hand warmers of various kinds have been evolved that really keep out the cold, and one of the more recent of these is the one brought out by the Motorist Warm Grip Co., of Marshall, Tex.

As the accompanying picture shows, the device takes the form of a pair of grips designed to be laced to the steering wheel rim at the points where the hands usually rest. In the grips are electrical heating units that are connected, by means of a flexible cable, with the lighting battery or, in the case of a Ford car, with the flywheel magneto. The current required to maintain a comforting heat is said to be less than that required by one electric headlight. A switch for controlling the current is installed at any convenient point, such as the dashboard.

Under ordinary weather conditions it is not necessary to keep the current turned on all the time, for the wheel rim becomes warm and retains the heat for a considerable time after the switch has been turned off; furthermore, once the hands have become thoroughly warmed but little additional heat is needed to keep them comfortable.



"WARM GRIP" ELECTRIC HEATER



Heater for Which Four Claims Are Made.

With quantities of heat going to waste all the time the motor of a gasolene car is running, there is little or no excuse for lack of warmth in an enclosed car in cold weather, or for cold feet in an open car, for the exhaust gas can be made to give up heat enough to warm a whole house, to say nothing of a little cubby-hole in an automobile. One of the numerous appliances designed to extract this grateful warmth from the red-hot breath of the engine is the "four-in-one" heater manufactured by the Auto Heater Co. of America, which recently established itself at 1148 Bedford avenue, Brooklyn, N. Y., which is shown in the accompanying illustration.

The radiator proper consists of a series of pipes through which the hot exhaust is led; a metal grating over the pipes prevents a too close promimity to the pipe surfaces. The radiator is screwed to the floor of the car, or against the front of a seat, or, for that matter, in any position desired. A hole in the floor admits the feed pipe and another hole provides for the tail-pipe through which the waste gas escapes. A rotating valve, kept in motion by the pressure of the gases, is clamped over an opening cut in the exhaust pipe between the engine and the muffler, and connection is made with the radiator by means of flexible metal tubing. A rod, which can be carried to any convenient place in the car, serves to adjust the valve and so regulate the heat from the radiator. The manufacturers claim that the addition outlet provided for the exhaust and the contraction of the gas due to cooling has a beneficial effect on the running of the motor; in fact, the name "four-in-one" is intended to convey the claims that the heater does no less than four things—warms the car, saves fuel, reduces back pressure and increases horsepower!

G. B. CRANKSHAFT EQUALIZER

"FOUR-IN-ONE" HEATER

Crankshaft Truing Rendered Easy.

By way of rendering easier the truing of crankshafts, which operation heretofore always has required the use of a lathe and very nearly the complete dismantling of the motor, the G. B. Sales Corporation of 1,790 Broadway, New York City, just has placed on the market the device which is shown by the accompanying illustration and which is styled a crankshaft equalizer. With the device it is claimed that work which ordinarily can be performed only by an expert lathe hand and that may require from 15 to 40 hours' time, can be done by any repairman, regardless of experience, in from one-fifth to one-tenth of the time.

In many cases, it is pointed out by the makers of the device, it is not necessary to remove the crankshaft from the engine, provided only one or two bearing surfaces require attention. It is possible in such cases to drop the bottom half of the crankcase and apply the tool without disturbing any of the other parts. The device is of high grade construction throughout; the cutting blade is made of the finest grade of oil-tempered steel, and, it is stated, will true at least 25 crankshafts before it requires resharpening. The sharpening can be done easily by any repairman, or, if the blade is returned to the makers, it will be sharpened free of cost. To put the equalizer to work, the two halves are separated and clamped together around the crankshaft, after which the depth of cut can be adjusted by means of a nut at the top. The bearing opposite to the cutting blade is a roller, thus making for ease of operation.

The tool is made with such accuracy that it will leave the bearing surface upon which it is used round and parallel and will remove ridges and "scoring" resulting from lack of lubrication or very long wear. Of course it won't straighten a "sprung" shaft, but it will make a good bearing surface out of a bad one.

SIMPLIFYING WASHING WITH MODERN APPLIANCES

Up-To-Date Garage Equipment That Makes Car Washing Easy and Cuts Down Operating Expenses—Hanging Hoses vs. Hoses that Drag in the Mud—Overhead Devices and Some "Always Wet" Mops Compared.

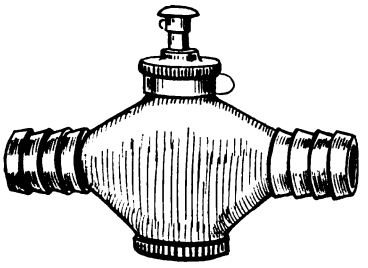
To wash or not to wash, to paraphrase the immortal Shakespeare, is not the question in the modern garage; nor have any wonderful, philosophical thoughts been uttered concerning the entirely prosaic practice of sluicing the mud off touring cars and limousines and runabouts. It is very largely a case of wash whether the garage attendant will or no, and it depends not so much on the salving of his conscience by the removal of all visible grime as it does on the condition of the paintwork of the car after the operation whether the job can be styled a truly satisfactory one or not.

It is altogether likely that if there had been any garage proprietors in Shakespeare's time, one of them, more intelligent than the rest, would have discovered in the bard's words a sermon truly applicable to his own business. Whether 'tis better in the end to suffer the slings and arrows of outrageous fortune, or to take arms against a sea of troubles, and by washing properly end them? To wash: To clean: No more; and by a wash is meant to wash the mud off and the thousand natural spots that cars are heir to—'tis a consummation devoutly to be wished. The garage proprietor's revised-to-fit-the-occasion Shakespeare might have been something like that, the burden of the song being to wash properly—to go about the work properly, in other words; not to do a slap dash, hose-dragging-in-the-mud job.

FOUR TYPES OF OVERHEAD VEHICLE WASHERS SUITABLE FOR PUBLIC GARAGES

There has been a whole lot written about the proper way to wash a car—what to use and what not to use in the way of mud and grease solvents, how to put the water on and how to take it off—though very little attention has been paid to the tools of the trade. And because a poor workman invariably blames his tools, there are quite a lot of poor workmen—because of the tools. To those who have watched the operations of the average vehicle washer, his results must be a mystery in view of his method. Gritty, greasy hose dragging through the washed-off accumulations of oily, muddy roads; time lost dragging the hose through the muck; water lost while the washer soaps the wheels and running gear; electric light bulbs "killed" in moving the portable lamp stand. The proprietor of the garage must pay for it all. If he were given to soliloquy he would do well to soliloquize somewhat after this fashion: To wash or not to wash, that is the question: Whether 'tis better to wash properly and enjoy the fruits of a labor well done, or to quit and go into some other business where washing is not necessary.

To wash a car properly is a simple job. But it is a job that cannot be done simply or properly or with any degree of efficiency under the antiquated pull-down-and-drag-hose method. In the first place, it is hard on the finish of the car. It may be easy to keep a gritty hose off the paintwork of a touring car—also it may be hard—but the boss is not always around to watch operations when the washer hoists up his hose to sluice off the top of a limousine, and in doing so inadvertently drags the hose over bright varnish; the varnish suffers. In the second place, it is hard on the hose and hose costs money. When it stretches from the water connection to the car, and possibly around the car, it is liable to be stepped on or run over and cracked and every inch it is dragged wears it out that much more. Probably the most dilapidated, worn-out piece of gear in nine garages out of ten, regardless of their whereabouts, is the



Digitized by Google

washing hose. Its appearance, to any one who ventures within the garage, must be prepossessing—with the reverse English on the adjective.

Apparatus that Helps the Worker.

That it is easy enough to make still simpler the operation of washing a car any proprietor of a stable will attest, for it was for his benefit primarily that devices for that purpose were developed and perfected. The washing of fine carriages presents difficulties almost exactly akin to those presented by the washing of motor cars. Hence, it has been a comparatively simple matter to make such slight alterations in apparatus designed for the stable that will make it fit for use in the modern garage.

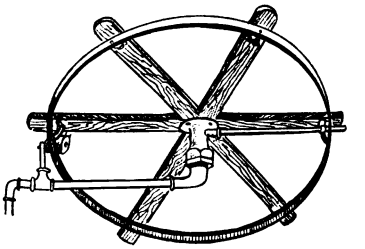
Washing apparatus in the abstract can be divided into two general classes, to wit: Those to which the hose attaches and those that attach to the hose. The latter category contains such devices as sponge and swab and brush-holders that attach to the end of the hose and through which the water passes continually. Devices in the first class consist essentially of overhead arrangements that facilitate the washing operation by keeping the hose up out of the dirt, preserving it from injury and unnatural wear, and keeping it constantly at the operator's hand regardless of his position. In both cases, there is no little variety in construction, though in no case is there any device that cannot safely be modified by the adjective simple.

FISKE WATER SHUT-OFF

Overhead Track Type Hose Carrier.

Harking back to the good old carriage days, as they are likely now to be apostrophized by those who have changed their vocations in view of the good young automobile days, probably the overhead washing device most in use was the kind that employs a circular track fastened to the ceiling, and this same device still is used in a great many cases and it is giving as universal satisfaction now as it did then—in both the stable and the garage. The Perfect Mfg. Co., of Albany, N. Y., makes several washers of this type, only one of which is illustrated herewith.

The crosshead, as it is styled, which means the wooden framework that is screwed to the ceiling and to which the circular track is fastened, is formed of six substantial cypress arms with varnish finish. The circular track is made of 1¼-inch angle iron and is seven feet in diameter—ample to provide good clearance for even a large car. The pipe and fittings are made of galvanized iron filled and bronzed and the joint at the center, which really is one of the most important parts of any such device, is heavy and substantial; the rotating section itself is 1½ inches in diameter. The roller that supports the hose and permits it to be shifted around the track is carried in ball bearings and therefore never requires lubrication, and is rubber-covered so that the action of the device is as quiet as possible. In another style produced by the same maker the same construction is followed, except that the hose connection is a double ender so that a hose can be attached at each end. With this device two men can work on the same vehicle at the same time, one on one side and t'other on t'other side. A shut-off is provided in one of the hoses, so that water will not be wasted when only one man is using the washer.



Swinging Pipes on Ball Bearings.

The advantage of this overhead track type of washing device lies in the fact that it is extremely simple, there is nothing that can get out of order, and it is not expensive; incidentally, it is as strong as any other device of the kind not using a track and will not wear out in a natural life time. The J. W. Fiske Iron Works, of 56 Park Place, New York City, is another concern that produces washers of this kind, together with washers of several other kinds designed for special purposes. The type that is illustrated herewith, for instance, was designed especially for private garages where appearance as well as utility must be considered.

It is styled the Elite and, though it has no overhead track, it has a support which is in effect a track. Encircling the rotating portion, the support carries a large ball bearing to which the extension pipe is connected by means of a very short arm, shown by the picture. That is practically all there is to the machine, except mention of the fact that it has been constructed to withstand the hard usage that it is anticipated it will sustain. In addition to washing racks, the Fiske company also produces a shut-off nozzle that is calculated to "ope' wide the eyes" of any garage proprietor with a penchant for reducing water bills. The device itself is shown by the accompanying illustration, and it can be attached by any one to any hose. In its simplest aspect it is nothing more than a valve, held closed by a spring and opened by the pressure of a finger; there is a catch to hold the valve open.

Substituting Braces for Tracks.

An overhead track is not an absolutely essential feature of a washer, of course, and there are several on the market in which braces take the place of the track. In the Peoria, for instance, which is produced by the Peoria Overhead Washer Co., of the Illinois city for which it is named, the place of the track is taken by two long steel braces that run from the central portion that attaches to the ceiling to the end of the extension pipe that carries the hose. With this washer, or with any of the others, for that matter, the water supply pipe can be either led up one of the side walls and over the ceiling, in case the main water pipe is below the floor, or it can be led in through the top, if the main water pipe passes between two floors, as often is the case.

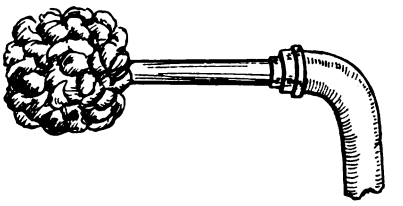
PERFECT OVERHEAD RACK

Eliminating Broken Lamp Expense.

Broken lamps and lamp stands and reflectors are only some of the things the garage man who works in ignorance of up-to-date equipment is called upon to replace from time to time. The washer smashes lamps moving his portable stand from place to place, the hose becomes entangled in it and it flops over with a crash and not infrequently other attendants, moving cars off and on the washing stand, bowl it over accidentally. Besides, devices of the kind are a nuisance, first, because they must be moved almost continually, or the fact that they have not been moved will be apparent in the car, and second because it takes time to move them and for this reason the efficiency of the operator is reduced by no small amount.

To obviate the necessity for portable lamp stands, several makers, among them the Vehicle Specialty Co., of Hartford, Conn., have developed overhead hose-carrying devices with which there is combined a cluster of electric lights so arranged that the light always shines over the place where the washer is working. Just how this has

Digitized by Google



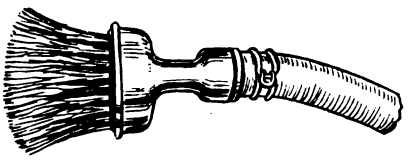
been done by the Vehicle Specialty Co. is made plain by the accompanying picture. The lamps and reflector are mounted directly on the extension pipe to which the hose is connected. So that the extension pipe can be swung in a complete circle, the wires leading to the cluster of electric bulbs terminate in a switch block which operates on the same principle as an ordinary ignition timer except, of course, that the contact rings are continuous.

The washer itself—it is styled the Rhodes—is quite a little different from any of the others, as may be seen by the picture. It has no overhead track, and by way of reducing the strain on the brace that holds the extension pipe, the pipe itself is extended in the opposite direction and this end, too, is braced. The end that is not connected to the hose, therefore, serves principally to balance the hose end, and in this way takes considerable strain off the central portion containing the rotating joint. One important function of the "blind" extension is that it keeps the hose arm properly "lined up" at all times and so reduces the wear on the joint. The joint, by the way, is so constructed that it can be adjusted for natural wear and maintained absolutely tight for an indefinite period. In construction, the pipe and braces are formed of wrought iron, the pipe fittings of malleable iron and the rotating joint of brass. The arms extend 4½ feet from the center, the spread therefore being nine feet, and the connections are made for standard ¾-inch pipe. In another type of washer, made by the same company, the construction is exactly the same, except that the lamps and reflector are missing.

Necessity for Stopping Water Waste.

In the small garage where not a very great amount of car washing is done, the bills for water may not be very large, but in a large garage where hundreds of cars are washed water must be conserved and as little wasted as possible, unless a serious cut in profits is to be expected. Hence, the garage proprietor who installs any kind of a device which will encourage the washer to economize on water makes a laudable attempt to increase profits. In any case, every drop of water saved is so much profit earned; and although several makers of washers have developed devices to help in the saving, few have reduced the problem to as simple terms as has the I. J. Smith Mfg. Co., of 4283 Park avenue, New York City, manufacturer of the Irving washer.

With the Irving washer, the operation of turning on the water or of cutting it off is performed by simply pulling down on the hose and letting it spring back to its normal position. The device is shown quite clearly by the accompanying picture, the hose arm extending on both sides of the central rotating joint and being weighted at one end to counterbalance the weight of the hose. The distinctive part of the Irving is contained in its valve mechanism. The supporting brace is a tube containing a spring which permits the washing arm to be drawn down by the operator. When it is pulled down, a valve in the center is opened and the water permitted to flow through



"L. M. PERFECT" MOP

the hose. When the arm is returned to its normal position the water automatically is turned off. So that the operator need not hold the arm down, a catch in the supporting tube holds it until it is desired to turn the water off, when the arm is drawn down about three inches further, releasing the catch, and then permitted to go all the way up. Another feature of the Irving that constitutes a sort of safety valve, so to speak, is that it is impossible to put a greater strain than 10 pounds on the hose. If the strain is increased the spring in the supporting tube stretches slightly, thus protecting the rotating joint.

Brushes and Mops Continually Wet.

Among the various washing devices designed to be attached to the end of the hose,

SMITH "FOUNTAIN" BRUSH

the L & M Perfect, as it is styled by its producers, the Adam A. Long Machine Works, of Rochester, N. Y., is representative of a number of similar devices designed to facilitate washing operations. It consists essentially of a nozzle to be attached to the hose and a washer end or top consisting of a mop of soft cotton yarn. Inside the nozzle there is a removable screen which filters and distributes the water to all parts of the mop. It is claimed that the yarn mop will not only outlast the heaviest and best sponge but that it will do the work of cleaning better than will the sponge. Incidentally, the yarn top alone is considerably cheaper than a sponge. Another device that is very similar in construction is produced by the Cataract Auto-Vehicle Washer Co., of Topeka, Kan., and the Rubberset Mfg. Co., of Newark, N. J., make another that is designed to hold a sponge and keep it saturated with water.

Variation of the Mop Construction.

Departing a little from the mop idea, though embodying the same principle, the device produced by the Jos. N. Smith Co., of Detroit, Mich., employs instead of a top of yarn or a sponge, a fairly stiff bristled brush through which the water flows in a continuous stream. Any device of the kind, obviously, is particularly advantageous for washing wheels and for getting into small places where mud lodges and where plenty of water is required to free it. At the least it is better than the time-honored sponge, which is comparatively expensive and which requires to be constantly dipped into a pail of water; incidentally, there is no possibility of the washer using the mop, or the brush, as the case may be, without water, or with insufficient water, and thereby laying the finish open to the likelihood of scratches.

Device that Extricates Mired Cars.

Probably there are few persons whose experiences include lengthy tours over other than the finest boulevards who have not made use of, or at least heard of, the method of pulling a car out of a ditch by wrapping a rope around a hub cap and making the engine do the work. But because it is not always easy to get a purchase on hub caps—some cars have none at all—the Pillsbury Sales Co., of 1020 Hennepin avenue, Minneapolis, Minn., has developed and placed on the market a device which it styles "Pillsbury Auto Pull." In its simplest aspect, it is nothing more than a small, detachable windlass drum fitted with clamps which attach to the wheel spokes and hold the drum firmly in place over the hub cap.

The rest of the outfit includes a stout rope and any handy telephone pole or tree. The rope is fastened to the pole or the tree, or to a stake driven into the road, wrapped around the windlass drum and the car pulled back to terra firma by the engine itself. The ingenious part of the device is that no tools are required to attach it other than a light hammer, which generally is included in every tool kit.

Pine Chips for Stopping Rattling Fenders.

Rattling fenders very often can be cured, temporarily at least, by the simple expedient of placing tiny soft pine blocks between fender and brace and drawing the bolts up snugly.

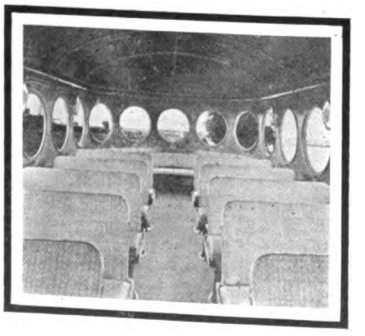
HAULING RAILROAD TRAINS WITH GASOLENE

Massive Motor Cars That Increase the Efficiency of "Short Lines" by Reducing Running Costs—How the Gasoline-Electric Drive is Applied to Passenger Coaches—Mine Locomotives That Operate on Oil.



With the electrification of those portions of trunk railroad lines that feed the suburbs of great trade centers, much of the problem of quick and efficient transportation of both animate and inanimate freight has been solved; to reach such outlying districts, minutes rather than hours from the main terminal, now costs the railroads but a fraction of what it cost under the old steam regime. But up to a short time ago there still remained the problem of providing efficient (from the railroads' point of view) transportation on what are technically known as "short lines"—lines which lie off the beaten track of the railroads and which connect the larger trade centers with smaller ones. Now, however, this problem has been largely solved by the development of internal-combustion engine driven locomotives and passenger coaches, and though little of the actual development that has taken place, and still is taking place, in this field, reaches the layman, it nevertheless constitutes a more than ordinarily interesting subject and one which serves to make plain that not only in road vehicles does the gasolene engine perform valuable service.

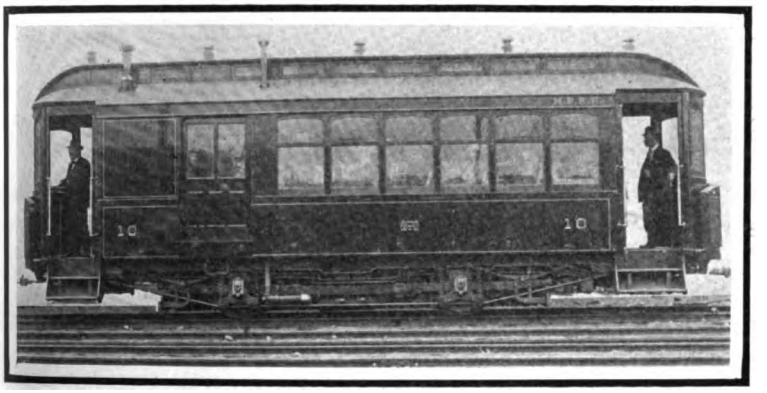
Abroad, where a great deal more attention has been paid to the possibility of reducing operating costs with the aid of such prime movers, internal combustion engined passenger coaches and freight locomotives are comparatively common, and during the time they have been in use they have proven conclusively that they represent a substantial saving over the older steam equipment. As one concrete example, the Arad Csanad Railway in Hungary had for a number of years operated steam trains over a short line and carefully compiled statistics revealed that the actual cost per mile figured out at 15.95 pence per train mile, which is equal to about 32 cents in American money. The cost of a Westinghouse gasolene-electric locomotive-coach, hauling, on occasion, one or more trailers, on the other hand, worked out at just 8.25 pence per train mile—about 16½ cents.

In America, too, similarly astonishing results have been obtained with the use of gasolene propelled passenger coaches on some of the Western roads. For instance, it has been estimated that to operate a locomotive and a single passenger coach costs 45 cents per mile—according to Trautwine, the total expenses on railroads in the United States usually range between 65 and 130 cents per train mile; alternating current operation costs about 22 cents a train mile and direct current about 17 cents.

LATEST TYPE McKEEN GASOLENE-PROPELLED PASSENGER COACH DESIGNED FOR "SHORT LINE" SERVICE

McKEEN CAR INTERIOR

In a very careful test that was made with an internal combustion engine driven passenger coach constructed by the Buckeye Mfg. Co., of Anderson, Ind., for the Union Pacific Railroad Co., however, the total operating cost figured out at approximately 4½ cents per mile.



The economical value of internal combustion passenger coaches and freight locomotives, however, is not their only recommendation, though it is a mighty powerful one. It will be appreciated, of course, that their greater economy comes from their high efficiency, the elimination of "stand by" costs, reduction in the amount of labor required, comparative cheapness of fuel and reduced wear and tear due to their lighter weight; incidentally, there are no boilers to clean out nor grate bars to replace, and stops for water or fuel are not necessary.

The appeal of such cars to passengers can be second only to the appeal of the electric car, for there are no cinders or smoke, speed is limited only by the desire

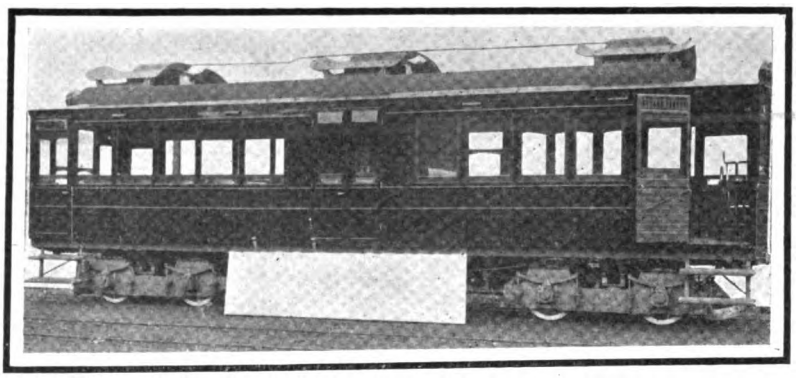
Digitized by Google

of the operating company, in case of collision or derailment there is no danger from unprotected "third" rails, and the operating mechanism can be made quite as simple as that of an electric car and a great deal simpler than that of a locomotive; hence the driver can give greater attention to the roadway and to signals designed for the safety of passengers.

In the United States, undoubtedly the largest manufacturer of internal combustion engined passenger and freight cars is the McKeen Motor Car Co., of Omaha, Neb., whose vehicles are in use not alone on home soil but in nearly every country in the world; only a few weeks ago a shipment of four narrow-gauge passenger coaches was made to Australia. All of the McKeen cars are peculiarly shaped, like an inverted boat, and there need never be any difficulty in recognizing them because of the distinctive round windows that are used exclusively. These windows, by the way, are a patented feature and are air-tight and water-proof and dust-tight. They are hinged to the roof and when open are locked up automatically. The appearance of the interior of one of these round-windowed cars is shown by one of the accompanying illustrations.

LAMBERT FRICTION DRIVEN PASSENGER COACH IN SERVICE

Starting Engines With Gunpowder.



Although, if judgment is based on the action of "fierce" clutches in automobiles, it might be supposed that some difficulty would be experienced in satisfactorily establishing the connection between the gasolene driving motor and the wheels, the McKeen company has experienced no trouble from this source and remains one of the few makers who employ no intermediary apparatus between engine and wheels other than a plain clutch. In the elongated passenger coach which is illustrated herewith and which now has been in use on the Oregon Short Line for some time, the motive power is furnished by a giant six-cylinder gasolene engine with cylinders measuring 10 x 12 inches. The engine is of the air-starting and reversing type and consequently there is no necessity for a reverse gear. For starting purposes, a low gear is used, and for high gear the drive is through a massive "silent" chain. On low gear the speed of the car is 14 miles an hour at an engine speed of 350 revolutions a minute and on high gear the speed is 38 miles an hour. Air for starting, blowing the whistle and for the brakes is compressed by an engine-driven pump. Cooling of the great motor is accomplished by water which circulates through pipes in the body of the car during winter weather and in this way heats the car. For lighting, acetylene gas is used entirely.

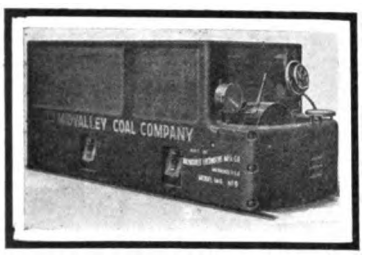
Where compressed air is not used, the starting of the giant motors that are used in some of these passenger coaches presents a problem of no mean proportions, and it has been tackled in a distinctly novel manner by the Westinghouse company, which produces quite a number of cars for suburban service. The motors that are used in Westinghouse cars have eight 8 x 7 cylinders set V-fashion, and the initial revolution is obtained by exploding a charge of black powder in one of the cylinders, for which purpose a special type of breech block, to hold a large cartridge, is used. These Westinghouse motors, by the way, do not drive directly; they are direct connected to large dynamos which generate current that is passed to electric motors which drive the wheels.

Economy in Friction Transmission.

In the passenger coaches produced by the Buckeye company, still another method has been adopted to start the driving motor which, in the car illustrated, has a four-cylinder motor rated at 150 horsepower; the big motor is started by a smaller one having four 4 x 4 cylinders; it is located forward in the smoking compartment. This Lambert car is otherwise distinctive by reason of the fact that it has a system of transmission that is exactly like the transmission system in the Lambert pleasure automobiles. The engine drives a large friction disk against which there is pressed another to which is attached a shaft carrying a pulley and a very heavy "silent" chain to the driving wheels. By way of reducing friction in the motor to the minimum, the crankshaft is mounted on great annular ball bearings. The seating capacity of the car, which is built expressly for suburban service, is 35 passengers and the control is so arranged that the car may be driven from either end, thus eliminating the necessity for loops at terminals. The weight of the car without load is approximately 11 tons.

In order to obtain great flexibility of drive and to permit easy and sure starting without jerk or jar, the British Leland company utilizes what is known abroad as the Thomas Petrol-Electric transmission, the principal elements of which are shown herewith, together with one of the passenger coaches to which it is fitted. Briefly, the Thomas system provides for an electrical drive for all intermediate speeds with direct mechanical connection between the engine and the road wheels on "high gear," or, as the British put it, "top gear." There are two dynamo-motors, one of which drives the other on occasion and also serves to maintain a storage battery of 18 cells

LEYLAND 160-HORSEPOWER COACH WITH THOMAS TRANSMISSION



Digitized by Google

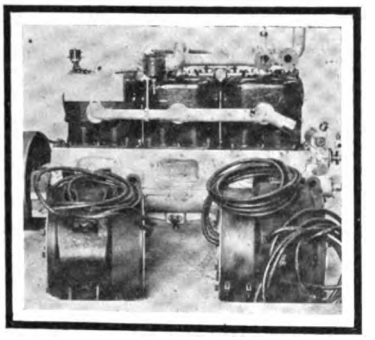
charged; this battery is used for starting and lighting.

Gas-Electric Transmission in Use.

Although the Thomas system is fairly well known abroad and has been used with a great deal of success in both pleasure and commercial road vehicles, this is the first time it has been applied to a rail vehicle and the service in which the car is used is an unusually rigorous one. The car is used in Central South Africa on a railroad upon which sharp curves and heavy gradients abound; in many cases the grades measure 1 in 25 or 30, though despite this fact, it is stated, the car has been able to maintain a speed of 30 miles an hour for the length of its run; its maximum speed with full load is 50 miles an hour. The motor has six cylinders cast in pairs and measuring 7 x 7 bore and stroke, and the rated horsepower is 170 at 670 revolutions a minute.

As little known as are internal combustion engine driven passenger coaches and freight locomotives—by comparison with

MILWAUKEE "GAS" LOCOMOTIVE



steam and electricaly driven rail cars—even less known is the gasolene or kerosene driven mine locomotive, though the industry that is built around these interesting little evidences of modernization has been steadily built up and is increasing. For use in mines where inflammable gases are liberated by the mining operations, neither steam, with its open flame boilers, nor electricity, with its sparking and sputtering trolleys or "live" rails, can be used, of course, and it is for this reason that the internal combustion engined locomotive steadily is ousting pony or mule power, which is slow and unprofitable and, above all, unreliable.

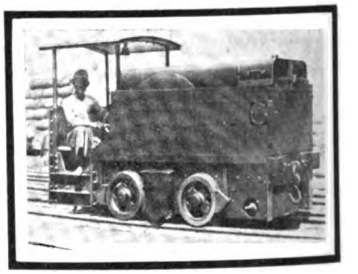
Where Gasolene Replaces Mule Power.

In the modern mine, ore cars and supply cars are drawn by a quiet little gasolene or kerosene-propelled locomotive that scarcely looks large enough to haul itself, let alone haul a string of "empties" or loaded cars. Obviously, these diminutive locomotives must be small, for they must go into very small places; and because they must also go into very dirty places it is absolutely essential that their mechanism be fully enclosed and protected alike from dirt and from the danger of accidental injury from falling rock and from the abuse to which they are likely to be subjected by their uneducated operators.

Need for Fireproof Construction.

Across the Atlantic these little mine locomotives are used to a much greater extent than is the case in America, though the Milwaukee Locomotive Mfg. Co., of Milwaukee, Wis., has made a strong bid for American business and has hundreds of its locomotives in operation all over the country hauling anything and everything from coal to ashes, clay, brick and cement. One of them is illustrated herewith, the picture

LEYLAND POWER UNITS



showing the careful manner in which the whole of the mechanism is enclosed and protected.

For motor power these cars have a four-cylinder vertical gasolene engine, though any fuel from distillate to kerosene or alcohol can be burned with equal facility. Power from the motor is transmitted to the driving wheels through a two-speed spur gearing in which the gears are constantly in mesh, and the speed changes are obtained by means of sliding dog clutches. For reverse there is a large cone clutch, opposite to the cone used for driving ahead; either clutch may be engaged by rotating the hand wheel shown in the picture. Where the locomotives are designed for underground use, they are fitted with removable fuel tanks, thus obviating the necessity for storing fuel in the works. To prevent the possibility of mine explosions, the mufflers are fitted with very fine wire screens which make it impossible for sparks to escape. In other types, the exhaust is led into a chemical solution and all flame is effectually extinguished.

By way of comparison with foreign standards in the construction of utility cars of the same general type, there is illustrated herewith a typical British mines locomotive, the photograph showing the machine at work on a wharf in Burmah; the machine illustrated is produced by Ironside Son & Dykerhoff. The motor operates on "petrol," which is the British equivalent of gasolene, and the fuel consumption is said not to exceed .66 pound per brake horsepower hour. Transmission is by spur gear and metal-to-metal clutches, final drive being through a large-size Reynolds "silent" chain running in an oil bath and completely enclosed. For control there is a single wheel, which, for forward speed, is rotated in one direction, and for reverse in the other direction.

Cheapness of Producer-Gas Cars.

In all of the operative cost comparisons that have been made the fuel used has been gasolene, though obviously the figures could be considerably lowered through the use of kerosene or some other distillate that is not in such great demand as is gasolene. Already experiments are being carried on with a view to using the heavier distillates for this purpose, and Dr. Diesel's locomo-

PARAFFIN DOCK LOCOMOTIVE

tive, it is understood, has been completed and has given a good account of itself in its first trials. Furthermore, the Ironsides company has produced quite a number of internal combustion engined rail locomotives operating on producer gas in which the total operating cost has been as low as four cents per car mile, which of course, is so ridiculously low as compared with the cost of operating even the lightest of steam engines as to leave no room for doubt regarding the economical value of prime movers of the kind.

Steel Tires Banished on Trucks in Paris.

No more steel-tired commercial vehicles will be allowed on the streets of Paris after the 15th of the present month, according to the order of a new prefect of police. The order, which was promulgated in the larger German cities some time ago, is an effort to ameliorate traffic conditions. Heavy haulage has been well established in the French capital, and the steel tires are said not only to be noisy but to work great damage to the pavements. With the order goes a speed restriction of 7½ miles an hour for trucks.

DE PALMA DRIVES FAST ON TRENTON HALF-MILE TRACK

Immense Crowd Sees Him Win Three of Seven Events with Mercer Car in Mercer Territory—Wishart the Runner-up.

Almost within their own backyard, three Mercer cars, piloted respectively by Ralph De Palma, Spencer Wishart and Ed. Pullen, proved the center of attraction of the Saturday afternoon racemeet that rung down the curtain on the Interstate Fair at Trenton, N. J., on the 4th inst. Originally, the meet was scheduled for Friday afternoon, but owing to continued rain, which made the track sloppy, it was put over one day. Of the three Mercer pilots, De Palma, needless to add, was the bright particular star, for he won every event in which he started —which means that he accounted for three out of the seven races on the card. And, as usual, Spencer Wishart was the runner-up, in all but one event.

During the whole of the afternoon, the weather was all that could be desired, and in consequence the grandstands were jammed to capacity; it is estimated that the crowd that turned out is the largest that ever assembled in Trenton to witness automobile races. The track was in excellent condition, the rain serving to lay the dust and to harden slightly the soft spots, and it is probable that if the track had been larger—it measures only one-half mile in circumference—record time would have been approached, if it was not beaten. As it was, De Palma had no particular difficulty in distancing his competitors, and at no time was there any doubt regarding the winner's name after the starting gun had been fired. The summary:

Five miles, class C, 161-230 inches—Won by Roberts (Roberts special); second, Lonsetreth (Ford); third, Tams (Hudson). Time, 7:39¾.

Ten miles, class E, under 300 inches—Won by De Palma (Mercer); second, Wishart (Mercer); third, Pullen (Mercer). Time, 13:24.

Five miles, class E, under 450 inches—Won by De Palma (Mercer); second, Wishart (Mercer); third, Pullen (Mercer); fourth, Hauft (Buick). Time, 6:27.

One mile time trials—Won by Huchman (Mercedes) 1:06⅗; second, Wishart (Mercer), 1:14¼; third, Applegate (Lozier), 1:18.

Ten miles, class D, free-for-all—Won by De Palma (Mercer); second, Wishart (Mercer); third, Applegate (Lozier). Time, 13:10¾.

Australian Pursuit race, class E—Won by Wishart (Mercer).

Ten miles, class E, free-for-all handicap —Won by Roberts (Roberts special); second, Pullen (Mercer); third, Hauft (Buick). Time, 13:58¾.

Judge Condemns the "Speed Trap."

It sounds too unusual to be true, but it nevertheless is a fact that there is one judge in the country who has no use for "speed traps" and who refuses to stand for the conviction of any motorist who is enmeshed in the toils of the law through "lying in wait" methods. He is Judge Walter A. Ferris, of Port Chester, N. Y., a Westchester county village of approximately 13,000 inhabitants.

A few days ago when a motorist was arraigned before him, Judge Ferris turned to the motorcycle patrolman and said: "I am not going to stand for any traps to catch automobilists. You can bring them in here by the thousand, if you want to, and if you are going to hide to catch them I will discharge every one of them. Get out in the open and catch them, if you want to, but don't hide behind fences."

The cause of this remark was the arraigning of James Tate, chauffeur for Henry Steers, of King street, who was arrested for speeding on King street in an automobile at the rate of 42 miles per hour. When the court learned that Patrtolman Henne had been standing with his motorcycle on Comly avenue, and had "popped out" on the unsuspecting offender, he refused to fine the man, and discharged him.

The judge explained that he is anxious to have the law enforced, but he does not believe in this "trapping business" and will not convict prisoners brought before him who have been caught in that manner.

Disbrow Sets up New Kind of Record.

Louis Disbrow established a record for a cloudy afternoon in Oklahoma City on Friday last, 3rd inst. Officially, however, it was styled a "world's record for one mile on a half-mile track," but as there is no such thing—at least in the eyes of the American Automobile Association, or any other sports governing body—it must have been the other. And the only reason he did not make a record for a real rainy Saturday afternoon was that the track was too wet; it was supposed to be a two-day meet, but the last half was called off. Disbrow's record was made in his Simplex, with which he circled the track twice in 1:05⅗, which is pretty fast driving even if it is not a record. Not to be outdone, Endicott sallied forth in a Case and whirled off four whirls in 2:17, thereby establishing a new "world's record," of course. Otherwise, the meet was the usual Disbrow triumph, with Endicott and Hearne and Heinemann not very frequently showing in front.

VANDERBILT AND GRAND PRIX ARE FORMALLY DECLARED OFF

Savannah Automobile Club Unable to Obtain Enough Entries, Will Return Trophies — Resurrection Is Unlikely.

All hope for the holding of the Vanderbilt and Grand Prix races, this year at least, has petered out. The races are off, irrevocably and unequivocally, as far as Savannah is concerned, and as Savannah was the only place they could be held—where preparations were complete enough—there won't be any races in 1913. The final action abandoning the races was taken at a meeting of the Savannah Automobile Club on Monday night, 6th inst., when President Harvey Granger announced his inability to influence a sufficient number of entries to make the contest worth while. Most of the trouble was caused by the club refusing to waive entry fees.

When in New York in search of entries, he let it be known that unless 10 signed blanks were in hand by October 5th, when the entry list would close, the whole project would be called off. And as the entries did not materialize the trophies will be returned to the Motor Cups Holding Co. and the grandstands will be taken down and laid away in camphor. Whether the races will be held next year it is too early to predict with any degree of accuracy, though if they are held it is certain that the course will be located in some other section of the country. Trenton enthusiasts have several times suggested that a course in the vicinity of that New Jersey town could be prepared and properly policed, and it seems as likely that the races will be held there as anywhere else—provided they are held at all.

Engine Starting that Up-Ended 'Bus.

Every once in a while a story that is almost good enough to be true comes from lands across the sea, and one of the latest is a real poser. It is not accompanied by a written guarantee. It sets forth that a big omnibus, with a long rear overhang, was taking on passengers, who congregated at the rear end of the machine, when the motor stopped. The driver went to the crank and gave it a vigorous upward heave; but instead of "turning over" the motor, he lifted the front end of the machine right up in the air, the weight at the rear end being so great as to cause the 'bus to tilt back on its rear wheels, much to the temporary terror of the chauffeur, who must have been terribly frightened at the sudden apparent increase in his strength.

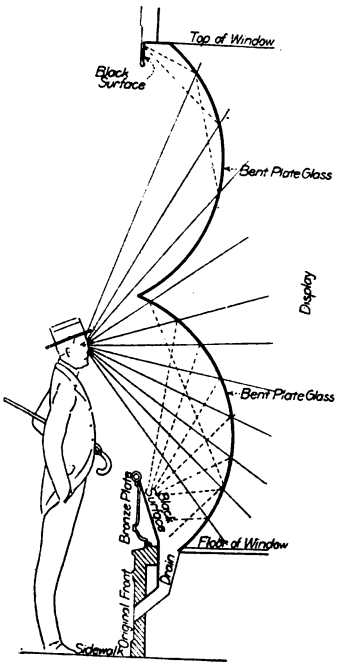
PREVENTING SHOW WINDOWS FROM BEING MERE MIRRORS

"Shadow Box" Which is Designed to Eliminate Glare from Plate Glass Front—Construction Radical—How the Device Operates.

Eliminating the glare which makes a mirror of a show window and thereby decreases if it does not destroy the window's value, is a problem with which dealers and accessory men have coped unsuccessfully; many an otherwise excellent showroom is hidden from the public merely by the fact that when a passer-by looks toward the window he sees not what is within but his own reflection or that of the buildings across the street.



To remedy this salesroom defect Tron O. Peterson, who is president of the Store Improvement Co., Inc., of 1476 Broadway, New York City, has patented and is about to market a store window which is revolutionary in its character and a model of which does what its inventor claims for it, although he has not yet completed his first real window. One, however, is being constructed for R. H. Macy & Co., one of New York's largest department stores, and the project has aroused considerable interest in merchandizing circles.

What the window is is partially made clear by an accompanying illustration, but further description is necessary. It is styled a "Shadow Box" window, and is the result of five years' experimentation by Peterson, who has been a sales manager, store efficiency expert, patent investigator and numerous other things.

The window is made of two sections of curved plate glass. These are arranged one above the other, and joined by a ground glass edge or a metal binder, and each is as long as the window is wide. To preface the description, it may be stated that with an ordinary flat window the glare is caused by light from the sky or street meeting the window and being reflected to the eye of the observer. This causes the glare, and the reflected light is so much stronger than the light within the window that the observer is unable to see through. To see clearly he often must put his face to the glass and shield his eyes with his hands.

The "Shadow Box" window is designed to prevent this reflection. When an observer stands as does the figure in the illustration, a line drawn from his eye to the glass and reflected at the proper angle leads, as is seen, to what is marked "black surface" at the bottom of the window. Therefore, any light which is to be reflected to his eye from the window must come from this surface, and since the surface is black there is no reflection. By following any one of the lines from the observer's eye it will be found to lead to the black surface of the "shadow box."

The lower curved section is all that generally is used by a man of average height in looking through the window, but to make the scheme complete the upper curved section is added and is fitted with a "shadow box" at the top, marked also "black surface." To allow for water which might accumulate in the box at the bottom of the window, a drain is provided to the sewer in the basement or, when that is not practicable, to the sidewalk, as is the case in the illustration.

"SHADOW BOX" WINDOW

The fact that the in-curve of the window lessens the window floor space is not so great a disadvantage as might seem, for the best of window trimmers state that no large figure ever is placed within three feet of the base line of the window, and in the case of cars this distance might be still greater with advantage. Peterson states that the curved window also offers greater resistance to wind than does a flat glass.

In viewing a model window which Peterson has constructed, showing his device and a flat window side by side, each containing identical displays, the Peterson window accentuates a not generally realized fact that since plate glass absorbs a certain quantity of light, any article displayed is just that much darker when viewed from without. The Peterson window, however, gives a better effect than does the flat type.

STANDARDIZED SELLING AND WHY IT IS MOST EFFECTIVE

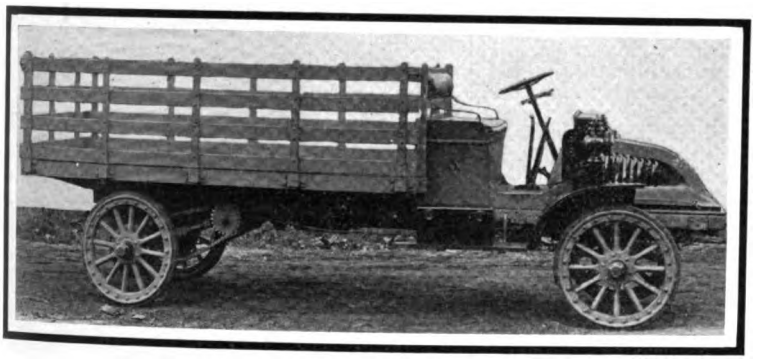
Cole Representative Applies Cole's Favorite Word to Salesmanship—Says It Is Presenting Best Points in Best Way.

Of course, "Standardization" is a busy word with the makers of Cole cars, and it is not surprising that when Homer McKee, of the Cole Motor Car Co., addressed a meeting of advertising men in Chicago he should bring up the matter of "standardization." He did so, but did not apply it to a car. He recommended the standardization of salesmanship, and of advertising.

McKee described a sixth sense which enables a man to "feel" the public pulse and attitude. "I think that the greatest asset that an advertising man can have is what I would call a sort of sixth sense," said McKee, "and which I would distinguish as his sense of mass psychology. This is an inherited thing, an instinctive thing. You cannot acquire it behind anybody's counter, or in anybody's factory, or in anybody's school

"If Providence has denied you this instinct which enables you to anticipate the reception which your efforts will be given at the hands of the public, no advertising genius can give it to you at 15 per cent on the net. When you have proven, however, to yourself that you can sense the attitude of the public toward any given effort with reasonable accuracy, you have resolved your problem into its simplest form.

"When you have succeeded in analyzing your merchandise problem in the best possible way; when you have succeeded in transcribing its selling advantages into the best possible expression; when you have dressed this best possible expression up until it has become as appealing as possible—after you have done all this, if you then print this expression, which we call an advertisement, in the best possible medium for your particular purpose, you have standardized your advertising.



"Now, the same principle applies to the problem of salesmanship in precisely the same way. When you have succeeded in analyzing your merchandizing problem in the best possible way, and transcribed its selling advantages into the best possible sales talk; when you have dressed yourself and your speech up, until you become the best possible vehicle for this sales argument; when you have done this, and have thrown your whole soul into the business of moving your commodity at the legitimate profit, you have done your duty in the best possible way. You have standardized your salesmanship."

BIG AND LITTLE MODELS IN HORNER TRUCK LINE

Sizes Range from 1 to 5 Tons and All Have Continental Motors — Improved Cooling System Has Condenser Over Radiator.

In somewhat revised form, though bearing most of the earmarks of its predecessor, the Grabowsky truck, the Horner truck is offered by the Detroit-Wyandotte Motor Co., of Wyandotte, Mich., in no fewer than five sizes—1, 1½, 2, 3 and 5 tons capacity, respectively. As stated in Motor World some time ago, the Seitz Automobile & Transmission Co., of Wyandotte, purchased much of the Grabowsky machinery at the receiver's sale and proceeded to prepare a line of machines differing from the older models chiefly in the use of a stationary power plant instead of a "quick detachable" one, and in having the radiator behind the engine instead of the more conventional forward position. G. A. Horner, who was in charge of the Grabowsky plant for the receivers and is general manager of the newer company, has with him Wm. Parkin, who developed the Rapid and Grabowsky trucks, as chief engineer; John Baker, Jr., first sales manager of the Rapid company and for years secretary and sales manager of the Grabowsky company, as sales manager; Robert A. Parker, formerly traffic manager for the Rapid company and later service manager for the General Motors Truck Co., as assistant sales manager; and as service manager, Morris Pierce, who for years held a similar position with the Grabowsky company. Obviously, Horner and his staff are not lacking in familiarity either with their own truck or with the motor truck situation generally.

SIDE VIEW OF HORNER TRUCK SHOWING SLOPING HOOD

Throughout the line of Horner trucks Continental motors are employed. In the three smaller sizes the same motor is installed, the bore and stroke being 4⅛ x 5¼ inches, respectively; the cylinders are cast in a single block and are of the L-head type. Valves are enclosed, as in all Continentals. Of course, the motor of the 3-ton machine is more powerful, the bore and stroke being 4½ x 5½ inches. The cylinders are of the L-head type, as is the case with the smaller engine, but the castings are made in pairs. In the big 5-tonner the engine is still larger and is of the T-head type, with cylinders of 5¼ inches more and 5¾ inches stroke. In all cases ignition current is generated by Mea magnetos. Also standard in all the trucks are Brown-Lipe gearsets, disk clutches and differentials, Spicer universal joints, Whitney chains, Timken roller bearings and Ross steering gears.

Considerable constructional work in the way of manufacturing parts for the cars is done in the company's own shops, where are built the frames, rear axles, front axles and jackshafts. In the case of the lighter types the frames are of the conventional pressed steel variety, while in the "big fellows" heavy structural steel is the material used for this purposes. Owing to the very rough treatment that often is unavoidable in motor truck service, more or less trouble with spring fastenings is not uncommon. In the Horner truck, special pains have been taken to eliminate this form of annoyance and in addition to the usual two spring clips securing the springs to the axle, there is a third clip at the center, passing through the axle. This system, together with the use of a high grade of spring steel, goes a long way toward eliminating faults in the suspension. The rear spring system is of the platform type, and all the parts are extremely substantial, notably the shackles, all the bolts of which are provided with means for the easy application of lubricatiton. Heavy radius rods, which are adjustable as to length, maintain the proper distance between front and rear sprockets. The front springs are semi-elliptic and are made and secured to the axles in the same way as the rear springs.

Overheating in a motor truck, due to a poorly designed or faulty circulation system, is a serious matter and capable of making trouble that is considerably more far-reaching in its effects than the mere delay caused by waiting for things to cool off. In the Horner truck particular study has been made of this phase of the truck problem, and the machine has been made proof against extremely hot climatic conditions, it is claimed.

Substantially mounted at the rear end of the sloping hood which covers the motor, the radiator takes air from both sides and from the front; a special opening in the center of the radiator is provided for the passage of hot air from the engine. The fan, which is of large size, maintains a current of cold air over the motor as well as through the radiator. At the top of the radiator there is an expansion chamber which also serves as a condenser for any steam that may form, turning it to water and sending it back to the circulating system. The position of the radiator is such as to give easy access to the motor and transmission, which are mounted together in a sub-frame and well protected against twisting stresses.

Care Needed in Tempering Tools.

In heating tools made of the finer grades of tool steel preparatory to hardening them it is absolutely necessary that great care be taken to see that the heated metal does not come in contact with the air or with gases which may have a deleterious effect on the metal. For this reason steel manufacturers recommend that fine tools be heated in an electric muffle furnace. Oil or gas muffle furnaces also may be used, but with them there is greater danger that combustion may not be as perfect as it should be and that, as a result, a certain quantity of gas will be liberated that may affect the tempering, and to some extent impair the quality of the steel.

It is equally as essential that tools be heated slowly and evenly. Time is quite as necessary in the operation as is heat, provided good results are to be expected and the finished tool is to stand up in use. Another important consideration is that the quenching bath must be perfectly clean; as soon as the liquid shows signs of becoming dirty it should be thrown out and fresh solution provided. In quenching the tool, it should be left in the bath until all vibration has ceased, when it should be taken out and reheated until water will boil on it. The tool is then placed in a tank of clean oil and permitted to remain in it until it is cool enough to handle without gloves. Immediately afterward the temper should be drawn to the required color, completing the process.

1,057,479. Vehicle. John Charter, Whitman, Mass. Filed April 19, 1912. Serial No. 689,704. (Front axle carried on laterally swiveling segment.) 1 claim.

1,057,485. Heating Device for Automobiles. Geo. F. Knollmann, Evansville, Ind. Filed June 6, 1912. Serial No. 702,136. (Exhaust gas heater.) 1 claim.

1,057,498. Motor and Transmission Supporting Frame for Motor Vehicles. Walter F. Pfander, Flint, Mich., assignor to Durant-Dort Carriage Co., Flint, Mich., a corporation of Michigan. Filed Feb. 2, 1912. Serial No. 674,983. (Friction transmission system.) 9 claims.

1,057,506. Carburetter for Internal-Combustion Engines. Elbridge W. Stevens, Baltimore, Md. Filed June 2, 1910, Serial No. 564,661. Renewed Sept. 28, 1912. Serial No. 722,980. (Carburetter with throttle, air and fuel valves interconnected.) 12 claims.

1,057,514. Resilient Tire. Arthur W. Washburn and Charles D. Keeler, Memphis, Tenn. Filed Jan. 17, 1912. Serial No. 671,552. (Tire with a plurality of annular rows of pneumatic chambers.) 1 claim.

1,057,524. Gear-Shift Lever Device. Phares W. Brubaker, West Reading, Pa. Filed March 18, 1912. Serial No. 684,580. (Locking device for selective gear lever.) 9 claims.

1,057,526. Power-Transmission Device. Armand Calame, Elgin, Ill. Filed Sept. 9, 1912. Serial No. 719,323. (Planetary transmission gear.) 3 claims.

1,057,530. Power-Transmission Mechanism. Joseph Doepker and Fredereick W. Burger, Fort Wayne, Ind. Filed May 31, 1912. Serial No. 700,878. (Cam-operated band-and-drum clutch.) 3 claims.

1,057,561. Hub for Detachable Wheels. Pierre Lapertot and Antoine Fayard, St. Etienne, France. Filed July 30, 1912. Serial No. 712,314. (Quick-detachable hub for wire wheels.) 2 claims.

1,057,570. Windshield. Isaac C. McQuillan, Pittsbrugh, Pa., assignor to Winterton Mfg. Co., Pittsburgh, Pa., a corporation of Pennsylvania. Filed Nov. 9, 1910. Serial No. 591,478. (Windshield hinge with ball catches.) 2 claims.

1,057,617. Transmission-Gear-Shifting Mechanism. Alanson P. Brush, Flint, Mich. Filed Feb. 15, 1911. Serial No. 608,667. (Selective control for sliding gears.) 2 claims.

1,057,623. Hydraulic Power-Transmission Mechanism. Louis Marie Gabriel Delaunay-Belleville, Paris, France, assignor to Societe Anonyme des Automobiles Delaunay-Belleville, St.-Denis, France, a corporation of France. Filed June 12, 1911. Serial No. 632,620. (Control for hydraulic transmission system.) 3 claims.

1,057,638. Automatic Lamp Lighter and Controller. William C. Hamilton and William Lee Bird, Indianapolis, Ind. Filed March 23, 1912. Serial No. 685,892. (Combined control valve and switch.) 8 claims.

1,057,672. Automobile-Tire. Jacob Ruppert, Jr., and Ernest Siegel, New York, N. Y., assignors of fifty-two one-hundredths to Ernest Siegel, and twenty-four one-hundredths to Michael J. Cantor, New York, N. Y. Filed March 5, 1912. Serial No. 681,685. (Solid sectional tire and fastenings.) 5 claims.

1,057,676. Pneumatic Tire. George A. Shaw, Barberton, Ohio. Filed Nov. 27, 1911. Serial No. 662,721. (Pneumatic tire with heavy tread member.) 1 claim.

1,057,734. Automobile and Vehicle Tire. Samuel A. Harrison, Chicago, Ill. Filed Sept. 22, 1911. Serial No. 650,784. (Bowed springs between inner and outer rims.) 1 claim.

1,057,741. Gas-Engine Cylinder. Thos. W. Keen, Swissvale, Pa. Filed June 8, 1912. Serial No. 702,552. (Sectionally cast cylinders.) 5 claims.

1,057,746. Emergency Tire. Franklyn William Kremer, Carlstadt, N. J. Filed Aug. 5, 1910. Serial No. 575,754. (Solid tire with clincher beads.) 1 claim.

1,057,775. Transmission-Gearing. James R. Ricketts, Los Angeles, Cal. Filed April 1, 1912. Serial No. 687,869. (Connection for forked torque tube.) 2 claims.

1,057,822. Flexible Coupling for Driving-Wheels. Richard F. Grant and Herbert E. Wetherbee, Cleveland, Ohio, assignors of one-third to Howard M. Hanna, Jr., Cleveland, Ohio. Filed Dec. 30, 1911. Serial No. 668,801. (Spring device for cushioning drive.) 11 claims.

1,057,865. Control Lever Lock for Motor Vehicles. Hiram P. Maxim, Hartford, Conn., assignor to the Waverley Company, Indianapolis, Ind., a corporation of Indiana. Original application filed Feb. 27, 1908, Serial No. 418,056. Divided and this application filed March 15, 1912. Serial No. 683,999. (Electric vehicle controls.) 9 claims.

1,057,888. Safety Cranking Device for Engines. Adolph Schreck, Phoenix, Ariz., assignor of one-third to J. Fred Cleveland, Phoenix, Arix. Filed Nov. 25, 1911. Serial No. 662,374. (Anti-kick crank with ratchet release.) 4 claims.

1,057,902. Wheel. Charles E. Wade, Masonville, and Charles J. Lagerwall, New York, N. Y. Filed Nov. 2, 1911. Serial No. 658,162. (Wheel with annular helical spring between inner and outer sections.) 3 claims.

1,057,904. Electrical Vulcanizer. Walter Henry Welch, London, England, assignor to Harvey Frost & Co., Ltd., London, England. Filed July 25, 1912. Serial No. 711,565. (Electric vulcanizer with water compartment.) 5 claims.

1,057,907. Automobile Wheel. Levi B. Wilson, Philadelphia, Pa. Filed Aug. 5, 1911. Serial No. 642,432. (Wheel with cylinder-and-piston spokes.) 2 claims.

1,057,916. Vehicle Wheel. Frank Barta, Ja., Deerfield, Mont. Filed Aug. 27, 1912. Serial No. 717,385. (Wheel with springs between inner and outer sections.) 1 claim.

1,057,937. Indication of the Speed of Moving Vehicles. Stuart Mill Colman, London, England. Filed May 24, 1909. Serial No. 498,077. (Speed-indicating lamp operated from road wheel by flexible shaft.) 1 claim.

1,058,005. Wheel for Motor and Other Vehicles. Robert William Sewell, Brooklyn, N. Y., assignor to Sewell Cushion Wheel Co., Detroit, Mich. Filed Feb. 20, 1909. Serial No. 497,207. (Rubber cushion between inner and outer rims.) 2 claims.

1,058,006. Vehicle Wheel. Oscar K. Sletto and William J. Shannon, Bend, Oreg. Filed April 26, 1912. Serial No. 693,485. (Wheel with dual tires and spring connection between spokes and tires.) 5 claims.

1,058,758. Vehicle Steering Mechanism. Samuel H. Kennedyq, Tunnel Hill, Ga. Filed April 5, 1912. Serial No. 688,749. (Rack-and-pinion gear with lever connections.) 4 claims.

1,058,805. Speedometer Drive-Gear. John K. Stewart, Chicago, Ill. Filed Jan. 18, 1913. Serial No. 742,780. (Gear system for speedometer drive.) 6 claims.

1,058,811. Rotary Self-Starter. Edward J. Thurber, New Orleans, La., assignor to Thurber Rotary Starter Co., Inc., New Orleans, La. Filed Aug. 23, 1912. Serial No. 716,634. (Engine starter with rotary motor.) 8 claims.

1,058,834. Shock Absorber. Samuel H. Yancey, South Bend, Ind. Filed Feb. 16, 1912. Serial No. 678,012. (Auxiliary spring with lever connections.) 3 claims.

1,058,835. Headlight-Steering Mechanism. Frederick H. Young, Wilmington, and George N. Cameron, Marshallton, Del. Filed Sept. 25, 1912. Serial No. 722,346. (Headlights moving with steering gear.) 3 claims.

1,058,864. Vehicle. George P. Henderson and John F. Parrott, Portland, Ore. Filed Oct. 24, 1910. Serial No. 588,722. (Spur gear drive direct to wheels.) 4 claims.

1,058,878. Universal Joint. Richard H. Lowndes, Atlanta, Ga. Filed June 18, 1912. Serial No. 704,448. (Universal joint with two rings.) 5 claims.

1,058,883 Lever-Control Mechanism for Motor Vehicles. Robert A. McEwen, Natoma, Kans. Filed May 19, 1911. Serial No. 628,323. (Interlocking pedal control system.) 1 claim.

1,058,899. Motor Vehicle. Henri Pieper, Liege, Belgium. Filed March 29, 1907. Serial No. 365,212. (Electrical speed-control system.) 6 claims.

1,058,910. Distance Recorder for Automobiles and Other Vehicles. Otto Schulze, Strassburg, Germany, and Edouard Seignol, Paris, France. Filed Oct. 6, 1911. Serial No. 563,258. (Disk type automatic recorder.) 4 claims.

1,058,956. Apparatus for Storing Gasolene and Other Inflammable Oil. Charles L. French, Cambridge, Mass. Filed April 19, 1911. Serial No. 621,966. (Liquid seal for filling-pipe.) 4 claims.

1,058,992. Internal-Combustion Engine. John Loftus, Albany, N. Y. Filed Sept. 6, 1912. Serial No. 718,892. (Compression chamber formed in piston.) 9 claims.

1,058,996. Valve Structure. Marshall E. Morel, Sheridan, Ill. Filed Oct. 16, 1912. Serial No. 726,187. (Reciprocating piston valve and driving gear.) 1 claim.

1,058,998. Wheel. Morris B. Okun, Seattle, Wash. Filed April 11, 1912. Serial No. 690,208. (Sectional tire, sections supported on spring-plunger spokes.) 3 claims.

1,059,009. Wheel. John E. Strietelmeier, Cincinnati, Ohio, assignor to The Ideal Wheel Co., Cincinnati, Ohio, a corporation of Ohio. Filed Nov. 10, 1911. Serial No. 659,638. (Curved spring spokes.) 12 claims.

1,059,026. Vehicle Wheel. Geo. D. Bulmer, Duquesne, Pa. Filed Oct. 19, 1912. Serial No. 726,734. (Curved spring spokes.) 1 claim.

1,059,050. Taximeter. Joseph William Jones, New York, N. Y., assignor, by mesne assignments, to Knickerbocker Trust Co., trustee, New York, N. Y. Filed Nov. 18, 1909. Serial No. 528,713. (Taximeter with operation controlled by indicating flag.) 25 claims.

1,059,103. Bolt for Internal-Combustion Engines. Douglas V. Ashley, Binghamton, N. Y. Filed March 9, 1912. Serial No. 682,722. (Cylinder-head bolts with drilled passages.) 9 claims.

1,059,109. Driving Mechanism for Automobiles. Levi W. Bogart, Trail, Okla. Filed Dec. 9, 1909. Serial No. 535,393. (Means for driving through steering wheels.) 1 claim.

1,059,115. Punctureless Vehicle-Tire. Phillip H. Calmus, Birmingham, Ala. Filed July 10, 19011. Serial No. 637,799. (Tire with recesses in inner side filled with air-cushions.) 1 claim.

1,059,122. Cushion Tire for Vehicles. John Dana, Burwell, Neb. Filed June 13, 1912. Serial No. 703,532. (Spring studs for tires.) 1 claim.

1,059,128. Tire Tool. Charles S. Edwards, Prineville, Ore. Filed March 12, 1912. Serial No. 683,365. (Screw-and-lever tire removing tool.) 13 claims.

1,059,158. Motor Disk Plow. John M. Henton, Edgemont, S. D. Filed May 14, 1912. Serial No. 697,181. (Motor disk plow with disks driven by motor.) 3 claims.

1,059,175. Valve-Grinder. Samuel S. Liverey, Bowling Green, Ohio. Filed Aug. 20. 1912. Serial No. 716,054. (Tool for oscillating valves for grinding purposes.) 3 claims.

1,059,182. Tire Chain. Douglas J. Martin, New York, N. Y. Filed July 15, 1911. Serial No. 638,634. (Non-skid of endless chains with spring connectors.) 14 claims.

1,059,183. Tire Chain. Douglas J. Martin, New York, N. Y. Filed Sept. 25, 1911. Serial No. 651,194. (Non-skid of endless chains with wire loop connectors.) 6 claims.

1,059,194. Vehicle Wheel. Bertie B. Moss, Salem, Ind., assignor of one-fourth to Gus Sims and one-fourth to Joseph Lennes, Indianapolis, Ind. Filed July 21, 1910. Serial No. 572,975. (Quick detachable tire rim.) 1 claim.

1,059,207. Pneumatic Tire and Armor Therefor. James A. Posey, Waxahachie, Tex., assignor of one-half to John E. Dunaway, Waxahachie, Tex. Filed Sept. 10, 1912. Serial No. 719,627. (Pneumatic tire with heavy protecting tread member.) 1 claim.

National

World's Fastest 500
Miles in Competition

Be more than a "dealer"

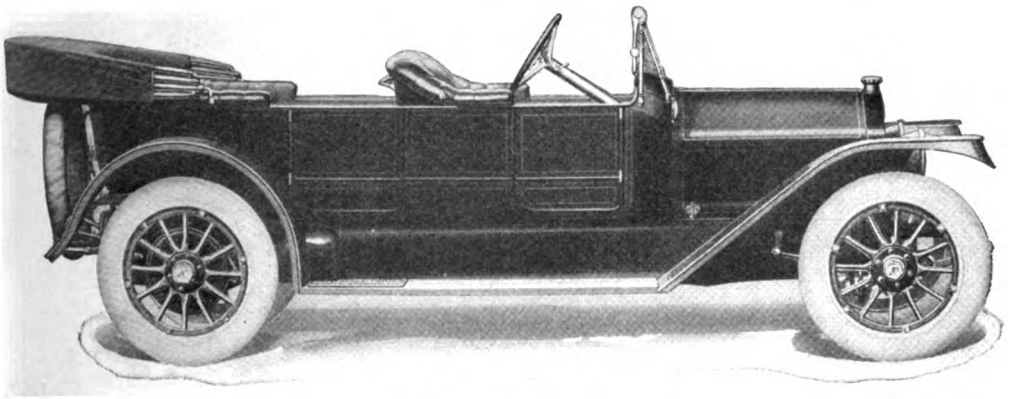
You are more than a "dealer" when you are a *National* Dealer. You become a member of the *National* family; an integral part of the great *National* sales organization. We take you into our confidence, we work for you and with you. You are as much a part of our organization as though you moved your desks into our factory offices.

First, we give you a guarantee that cannot be surpassed, a guarantee of good faith and reliability based on the quality of our cars and our reputation for dependable business methods.

Second, we give you practical assistance and complete and permanent service. Not a service in name only, but an actual, concrete service, the value of which is demonstrated by the success of our present dealers and the fact that year after year they are glad to remain with this growing and here-to-stay organization.

We would like to have you visit our factory. Here you will learn, as many others have learned, how and why *National* cars continue to maintain their enviable position in the trade.

Our manufacturing methods and facilities are a revelation. We build for quality. The efficiency, care, skilled workmanship and high grade materials that combine to produce *National* cars set the standards for the world.



If you will write us at once and let us know exactly what day and what train you will arrive on, we will meet you with a *National* car. Now is the time to do your investigating for the coming season. You can't afford not to let us tell you about our proposition.

We are building for the future. Every one of our dealers is building a permanent, positive, money-making business, with a backing of satisfied customers who are always ready and willing to "boost."

Remember—the day has arrived for a greater popularity of the quality car; the inferior car has been tried and the educated public now demands the 100% reliable and capable machine.

The *National* in power, speed, reliability, comfort, convenience, flexibility of motor, beauty of design and noiselessness is the one car whose only superior is a better *National*.

National Motor Vehicle Co., Dept. 90, Indianapolis, Ind.

Five models, $2750 to $3400

WHICH?

Body or Chassis?

The most important subject in connection with Auto-buying discussed in new booklet

The least understood part of the motor car—the *chassis*—which really represents seventy-five per cent of your car purchase, is discussed in a vigorous, open-faced manner in the latest booklet describing

FOURS **PATHFINDER MOTOR CARS** SIXES

It throws a new light on the dark region beneath the hood and floor boards which the inexperienced buyer will immediately appreciate.

You seldom hear a motor car salesman enthuse about the chassis, but he makes frequent reference to the "easy-riding qualities" of the car he is selling without telling you WHY.

Whichever you believe most in, body or chassis, you cannot afford to be ignorant of the *vital* part of your purchase.

Look Under the Pathfinder Hood

If you like the body design and the accessories on the dash, take a look beneath the hood of the Pathfinder and get posted on both sides of the question.

One thing is positively certain about the trend of the times in the automobile industry.

When manufacturers find they have reached the limit in extravagant accessories, they will pay more attention to the "business end" of the motor car, the *chassis*.

The Pathfinder is easily distinguished from the rank and file of medium-priced cars by its scientific chassis construction.

The Pathfinder Company was the first to give a complete chassis description in its literature and still remains the only company featuring detailed chassis construction in its catalog.

Here's a splendid opportunity for you to get an educational prospectus on the development of automobile buying by writing for our "Guide to Automobile Buying" and standard catalog.

The big question in your mind about the mysterious chassis will be comprehensively answered by our chassis analysis.

This desirable Pathfinder literature is FREE for the asking—Get it. Your name and address on the margin of this page will do.

NEW DEPARTURE BALL BEARINGS

American-Made for American Trade

The Proof of the Bearing Is In Its Service

The garage man knows better than anybody the comparative service merit of the bearings installed in motor cars he cares for and repairs.

We recently sent out letters to garage men throughout the country, asking them their opinion of New Departure Ball Bearings, based on their experience with it.

The complete summary of all responses received the first week shows that 96 per cent. of the garage men who have been using New Departures found them absolutely satisfactory. Many of them went as far as to say that it has proved superior to all others.

This remarkable evidence of the quality and efficiency of New Departure Ball Bearings is absolutely indisputable. Users of foreign-made ball bearings, whether garage men or manufacturers, should give this American-made bearing a thorough trial.

Every manufacturer, purchasing agent, superintendent, and designing engineer should have the Engineering Edition of the New Departure Ball Bearing Catalog and the brochure on "Bearing Friction and Its Elimination."

Every garage proprietor and superintendent should have the new Ball Bearing Garage Manual, now in its third edition. Either one, or all of these books, will be sent free on request. Drop us a line now.

Detroiter

Every Dealer in the United States Will Shortly Receive a Noteworthy Document Concerning This Remarkable Car

The things the Detroiter has accomplished within the past few seasons ought to be known to every dealer in automobiles. They are the shining proof of what all manufacturers have felt, though but few have put in practice—namely, that a "no season" automobile is the squarest deal that can be offered a purchaser.

In lots of a thousand, the Detroiter goes through the factory—each thousand lot an up-to-the-minute car.

On the thousand lot just starting, will be certain new features. These features will be described in the document every dealer may look for within the next few days.

They are additions that make the Detroiter—with its nine big fundamental features, such as the full-floating rear axle and platform rear spring—still the "best selling car of its class in the world."

IT WILL MORE THAN PAY YOU TO GIVE YOUR BEST ATTENTION TO THIS DOCUMENT WHEN IT REACHES YOU.

THE TRUTH FROM ENGLAND

"Centrifugal Speedometer is Popular Favorite"

Reproduced from Motorcycle Illustrated

...been invaluable. ...motorcycles not ... TOMMY ... TIP ... motorcycles. They will ... (D... Wash- ... ...ke ... ...ound ... quicker ...

HOW A CENTRIFUGAL SPEEDOMETER WORKS.—"Some of your readers may be aware that the centrifugal speedometer is the popular favorite in England without knowing exactly how it works," writes our correspondent, The Britisher. "The heart of the mechanism consists of a vertical spindle about 4 inches long, which runs in ball-bearings top and bottom, and is rigidly keyed or otherwise attached to the driving shaft from the front wheel. Halfway up this spindle a small, white metal flywheel floats loosely on two tiny axles. The flywheel is coupled by a small side-link to a bronze collar, which is free to slide up and down the vertical spindle, but is normally pushed up towards the top of the spindle by a light coiled spring.

"When the machine gets on the move, this vertical spindle is rotated by means of the gearing on the front hub, and the driving shaft attached thereto. The faster the machine goes, the faster the spindle spins; and the faster the spindle spins, the more the flywheel or "white" tends to flatten out and run in a horizontal plane, due to centrifugal force. Of course, as the 'white' runs flatter and flatter, its side-link pulls down the sliding collar. The flanges of the sliding collar grip and pull down a rod which operates the needle on the dial of the speedometer by means of a toothed rack. A small pinion on the tip of the vertical spindle drives the mileage disc by means of clockwork, giving a reduction of between 3,000 and 4,000 to 1."

The centrifugal speedometer, unlike the magnetic type, is not affected by changes in temperature.

It is just as accurate during the zero of Christmas as during the torridity of July.

That explains in a measure the reason for its world-wide popularity—the reason why the

CORBIN-BROWN SPEEDOMETER

"The Speedometer of Absolute Accuracy"

is rapidly winning general appreciation here.

It is simple in construction, yet more sensitive to speed variations than any other.

It registers low mileage as well as high.

In some speedometers, the indicator hand shows practically no action until a speed of from 8 to 10 miles has been attained.

The indicator is so adjusted that there is no "wabbling" or oscillation of the hand.

Every CORBIN-BROWN SPEEDOMETER is calibrated by hand and tested to absolute accuracy before being sent out.

Oakland

"THE CAR WITH A CONSCIENCE"

GROWING

¶ The history of the Oakland Motor Car Company has been a steady climb upward.

¶ Starting in a small way in 1908, the business has increased steadily year after year until, for the fiscal year ending July 31, 1913, the gross receipts amounted to over ten millions of dollars.

¶ We have been able to make this progress because we have built honest, serviceable automobiles.

¶ A company cannot thrive unless it does.

¶ In this commercial age, dealing as we do, with a keen public, it is absolutely necessary to make every purchaser an "asset"—a satisfied customer who is willing to freely recommend his choice to his friends.

¶ Good will is a priceless thing to have.

¶ The Oakland has it.

¶ "Fours" and "Sixes." Different body designs. Prices $1150 to $3600.

¶ Send for a catalog.

The New KRIT $950

The only low priced car of up-to-date appearance with beautiful streamline body, modern fenders, full equipment, high grade upholstering, and other high-priced-car features.

(With Disco Electric Self-Starter $1050)

Extra large, five-passenger body, streamline type
Tapered bonnet
Rounded radiator
Modern fenders
Leather-lined body
Gasoline tank in dash
4-cylinder motor; 25 h. p.
Bosch magneto
Stromberg carburetor
Electric lights and horn
Demountable rims
108-inch wheelbase

Up-to-the-minute style and quality with "light car" running expense

HERE IS A COMBINATION that the motorist of today is demanding.

BUT NO CAR IN THE PAST has fully met this demand. If it had all the modern features, its cost was higher than many people wanted to pay. If its price was low, it lacked the quality, style and appearance.

For 1914, however, the New KRIT absolutely meets this big demand. It has beauty of appearance, elegance of style, strength without unnecessary weight, standard mechanical features—and all at a low price—$950 (with Disco electric starter, $1050).

A Car That People Want

THAT THE NEW KRIT will be a big seller is already assured. Dealers who have seen it are enthusiastic. To those who have not seen it the picture above will give some idea of its beauty, size and "class."

THE GENERAL LINES of the car are strikingly similar to the 1914 models of well-known cars selling from $2,000 to $3500. High-priced-car-practice has been followed in the leather lined body; the cork-linoleum covered, nickel-bound floor boards and running boards; the gasoline tank in the dash; the fine electric lights (including combination license bracket and tail light); the dash control board; and many other features of refinement.

THE MECHANICAL FEATURES of this remarkable KRIT read like a list of specifications for any one of the high-priced 1914 cars. The basic design of the motor has not been changed in four years of successful manufacture. Advanced methods and improved materials have enabled us to lighten our pistons and connecting rods without sacrificing strength. Light weight and accurate balance eliminates vibration. No 4-cylinder motor in the world is quieter or runs more smoothly than ours.

Five Years of Satisfaction

KRIT CARS FOR YEARS have been known as reliable, serviceable automobiles. KRIT cars sold five years ago are still running satisfactorily. Records of 25,000, 50,000 and even 100,000 miles of use in owners' hands have demonstrated their mechanical soundness.

You Saw This Happen

WE BELIEVE THIS CAR presents a selling opportunity not equalled since 1908. History is repeating itself. Five or six years ago manufacturers brought out $1500 cars with features previously found only on the high priced automobiles. There was a tremendous demand. Far-seeing dealers who appreciated what was happening laid the foundations for comfortable fortunes.

SINCE THEN THE INDUSTRY has developed in two ways—"prices down" and "prices up." Today more and more of the best automobile buyers want the "prices up" features but at the "prices down" figures. The 1914 KRIT is the answer.

Reasons for KRIT Value

FIRST OF ALL KRIT cars are economically manufactured. Our overhead is low. We haven't a staggering investment in buildings and equipment. Many of our parts are made by allied companies who make them according to our own design and subject to rejection if not up to our specifications.

OUR OUTPUT IS large enough to take advantage of discounts in buying material and parts, but not so large that we cannot give the utmost care in manufacturing and inspection.

Our Policy

OUR POLICY FOR 1914 is to build a conservative number of cars; to contract with our dealers for the number they can sell—and the number we can deliver to them.

OUR COMPANY has steadily gained strength every year and is now in the best position in its history to help its dealers make a big success. The KRIT Company is thoroughly sound and stable, amply financed to take care of the output we propose to build; well organized; well managed. And we are furnishing our dealers the ***best*** car ever produced in the low priced class.

KRIT DEALERS are high class dealers. We want more of them. We want direct representation in many places where we now have sub-dealers. Some of our larger distributors have places in their territory which need to be more closely worked.

WITH THE SPLENDID NEW KRIT model, a well equipped manufacturing organization, and a vigorous forward sales policy, the KRIT line for 1914 offers to dealers a big opportunity of quick sales and permanent business.

WRITE US TODAY for full information and dealers' proposition. Come to the factory and see the New KRIT. Act today before your competitor does.

Stewart Hub Odometer

You have got to have an Odometer on your truck

THE Stewart Hub Odometer is one of the most important parts of a motor truck. It is ready every minute to tell the exact number of miles your truck has been driven. You must know this in order to figure the cost per ton mile. You must know the ton mile cost in order to learn whether your truck is making or losing money.

An instrument less accurate would do you more harm than good. The Stewart Hub Odometer is truth itself. It cannot go wrong. It is positive gear driven—far less complicated internally than your watch, and far more dependable. There are no trouble-breeding springs, pawls and ratchets in its makeup. It is more durable than the truck itself.

Without the Stewart Hub Odometer you would operate your truck hit-or-miss. You would not know whether it was running at a loss or a profit until your books told you at the end of the year. The Stewart tells you at once and all the time.

Whether you operate gasoline trucks or electrics, ***know the truth about them.*** Know ***in time*** when the cost is soaring. Then look into loading, routing, stops and other details for the reason, and set it right.

The Stewart Hub Odometer costs but $15.00—much less than the cost of making mistakes in one month alone. It ought to play its part on your motor truck from the first day.

Be sure to specify the Stewart Hub Odometer by name on your order, and start your trucks in service fully equipped.

See that the trucks you buy are equipped with Stewart Hub Odometers.

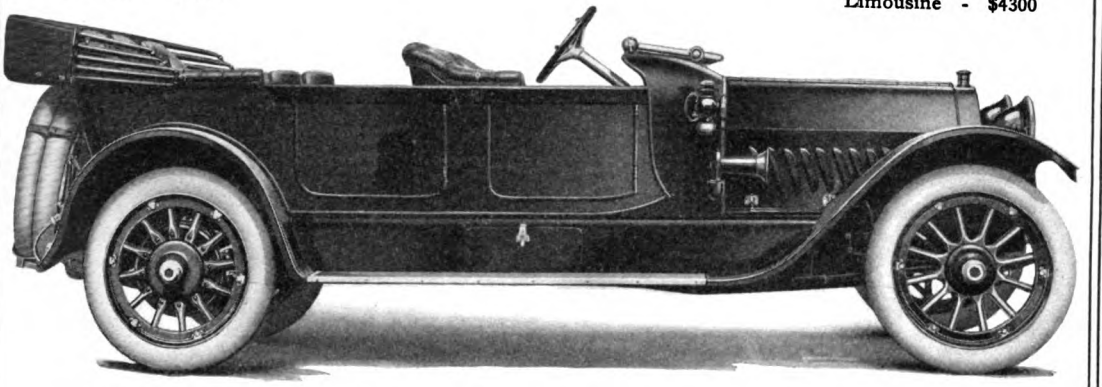
Four or Five Combination, Phaeton, Touring Body Type,

$2975



Seven Passenger Touring Body, $175 extra.
Limousine - $4300

Oldsmobile 1914

Four or Five Combination, Phaeton, Touring Body Type,

$2975

Seven Passenger Touring Body, $175 extra.
Limousine - $4300

Seven Passenger Touring Car, Model 54

Lower in price, and even higher in quality, than any of its predecessors—the Model 54—1914 Oldsmobile—is creating more concrete evidence of live dealers' interest than any other high grade six on the market.

THE PRICE

$2,975 practically eliminates competition with dealers handling cars priced from $4,000 to $5,000—for the Oldsmobile is as good as any of these. The lines of this car are of distinctive Oldsmobile design—a standard which has led all competition, whatever the price.

WE ARE SIX CYLINDER PIONEERS

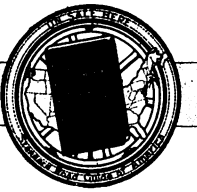
Oldsmobile pioneered the six-cylinder motor, and it is unnecessary to dwell on the value of the years of ripe experience in the manufacture of six-cylinder cars—which is back of the Model 54. The Oldsmobile unit power plant 3-point suspension (bore 4¼, stroke 5¼), is a wonderful piece of machinery.

MATTERS OF COMFORT, UTILITY AND REFINEMENT

We learned how to build comfort into the Oldsmobile in the early days of the industry. If we knew of any better equipment or little matters of refinement than are on the Model 54 we would be the first to install them; but we have put everything into this car that spells utility, comfort and refinement.

Here are a few of the equipment details: The very latest and improved Delco system of self-starting, lighting and ignition. Noil motor driven tire pump. Combination electric and oil side and tail lamps, special Oldsmobile design. Special design Oldsmobile electric head lamps. Special design three-way adjustable ventilating windshield. Top, boot, and patented adjustable side curtains—60 miles speedometer. Adjustable stem setting and winding Waltham clock. Rear tire irons, capacity for two tires. Demountable rims, one extra. Imported horsehair tonneau mat. Electric light in tonneau. Extension electric trouble lamp.

PROMPT DELIVERIES



Never in the history of this Company have we been so well prepared to take care of our dealers by prompt shipment of cars as ordered. We began the delivery of our new models August first, and each day sees the regular quota of cars coming through the factory, tested and inspected down to the minutest detail, on schedule time. You can absolutely count on all delivery promises being adhered to rigorously.

WRITE US AT ONCE

In a short while, orders for all cars available for the coming season will be closed, and we shall be unable to go beyond this point. We urge, therefore, that if you wish to sell a car that measures up to the highest standards of quality, workmanship and design, you write us at once, letting us know your prospects, size of territory desired, and your facilities for properly representing the Oldsmobile line.

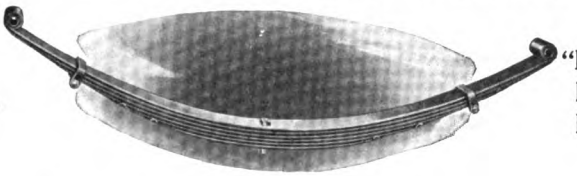
oss-Rolled Steel
Long-lived Springs

Cleveland-Canton Automobile Springs

It means the utmost in safety, astounding strength and greater resiliency, for such steel will stand more severe strains than ordinary steel.



With improvements in tires, in motors, in starting systems, now comes a startling improvement in springs.

Cleveland - Canton "Chrome - Vanadium" Springs are made by the "cross-rolled" method. The material is worked both longitudinally and transversely, then heat-treated in oil.

It is not a cheap process, but it adds immeasurably to the life of a car. It means fewer repairs, less depreciation, freedom from engine racking and jolting.

Cross-Rolled Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

Cars equipped with poor springs soon gain a bad name among motorists. For the vibration, bumping and jolting quickly sends engines to the repair-shops.

Because makers realize this, more and more cars are being equipped with Cleveland-Canton "Chrome-Vanadium" Springs, which give utmost elasticity, absorbing shocks and protecting the car and its occupants from shaking and vibration.

Cleveland - Canton "Chrome - Vanadium" Springs are specified on the leading cars this year. They are built for enduring service—they are the **springs you should have on your car.** *In five years not one Cleveland-Canton "Chrome-Vanadium" Spring returned because of breakage or settling.*

Send us your blue-prints and let us figure with you. You will learn facts of utmost importance to you.

This steering-arm of a Timken-Detroit Front Axle was bent into a circle by a powerful testing machine to prove that the steel is so tough it will never break in service.

There's Safety in Steering Arms That Stand Tests Like This

THERE'S safety in axles designed to meet the *maximum* stresses of every day travel with a *big margin to spare*—built of materials so good that, if accident does bring strains beyond what the axles should bear, they will *stand right up to the last ounce of pressure and the last severe shock*—then *bend* but not break.

It requires terrific blows and tons of pressure, in special test machines, to bend these axle parts, to prove that they are tough and strong, *but not brittle.*

And it is because Timken-Detroit Axle parts, are so tough that they *can* be bent twisted and flattened, cold, *without breaking* that the man who rides on Timkens *can confidently count on riding safely.*

There are no more important parts in your car than the axles and their bearings. Why this is so is told in the Timken Primers T-5 "On the Anatomy of Automobile Axles" and T-6 "On the Care and Character of Bearings." Sent free, postpaid, from either address below.

INVADER OIL

To Tell the Truth—

¶ INVADER OIL ***will*** leave a carbon deposit. So will every other oil.

¶ INVADER OIL ***will*** smoke when it burns. So will every other oil.

¶ When INVADER OIL is used it ***may be*** necessary to grind valves. Such certainly would be the case with every other oil.

¶ A motor using INVADER OIL ***can*** overheat. So it can when any other oil is used.

¶ A machine exclusively lubricated with INVADER OIL will eventually wear out. This would also be the case no matter what oil was used.

¶ INVADER OIL is ***not*** a perfect lubricant,—neither is any other oil. There is no such thing.

¶ INVADER OIL, however, is chemically superior to all other oils. It will deposit ***less*** carbon, — make ***less*** smoke,—mean ***less*** grinding of valves,—make a motor ***less liable*** to overheat, and will cause the machine using it to last ***longer*** mechanically than would be the case were ***any*** other oil used.

¶ Remember that the superiority which is indicated by its better tests is a superiority which cannot be contradicted. INVADER OIL is better because its tests are better. There is no way of avoiding this fact.

Territorial Agents are in a position to fill orders as promptly and at the

I-O-C GEAR OIL

Puts Noisy Gears to Sleep

¶ I-O-C GEAR OIL is the only oil ever made especially and exclusively for the lubrication of automobile transmission gears.

¶ It is absolutely different from any other oil made and possesses certain peculiar properties that cause it to face the gear teeth with a coating which is practically indestructible and prevents wear and reduces noise and friction to a minimum.

¶ It contains no foreign matter, such as ground cork, sawdust, etc., but is 100 per cent OIL, and being free from water and chemicals it will not foam in the case when running or allow the bearings to rust when idle.

¶ Remember, it is only the OIL which a grease contains that has any lubricating value. I-O-C GEAR OIL is not only all oil, but it's the only oil that will eliminate the hum or grind of metal gears.

A 10-LB. CAN COSTS $1.50

¶ A trial will convince the most skeptical that I-O-C Gear Oil is better than any grease, any dope, any compound, or any other form of gear lubricant ever put on the market.

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street **NEW YORK CITY**

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

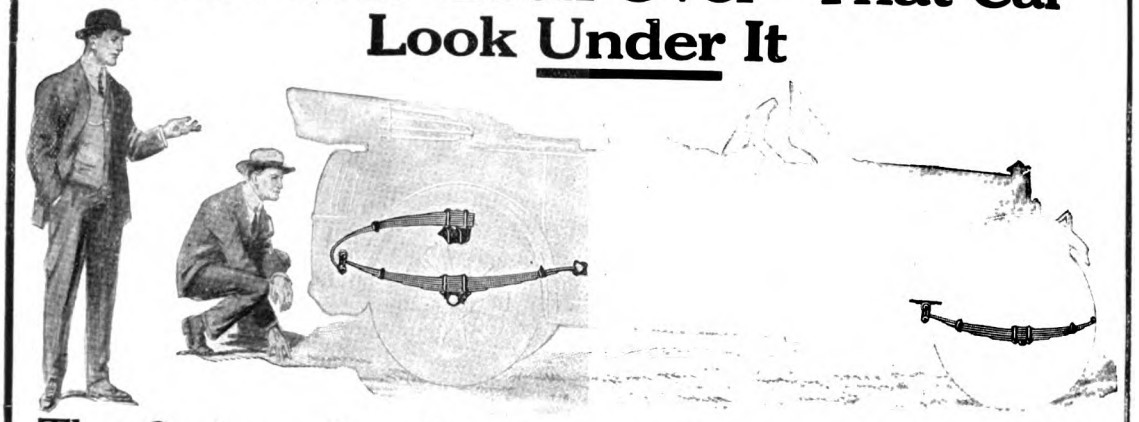
OUR departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.

We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.



Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky inefficient radiator and a "superheated" customer, then be sure this car was *not* equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

When You "Look Over" That Car Look Under It

The Springs Are "At The Bottom" of Any Car's

Comfort—Safety—Service

Naturally—super-excellence in springs entails a little greater investment. But—we are not offering a way to cheapen a car's *first* cost.

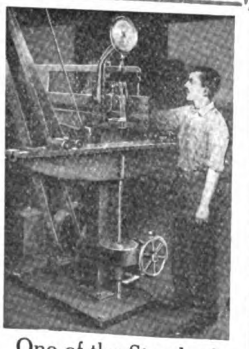
It's a way to greater car comfort—to greater security—to economy of up-keep—to saving of wear on the delicate propelling mechanism.

The insurance against accidents is worth more than the additional cost. Add to that the higher efficiency in saving car repairs, and insistence upon Detroit Springs in your car's equipment is only a wise precaution. Moreover—specifying Detroit Springs costs the car-buyer nothing. And though it costs the car manufacturer a little more—ultimately the builder of the car benefits as well as the buyer.

RESILIENT Detroit Springs SILENT—SELF-LUBRICATING

Detroit Springs Are "Unhurriedly" Made

From the first chemical analysis of the famous steel that forms the basis of Detroit Spring *super quality* to the severe final test, every step in the 48 details of the Detroit Process is slowly and scientifically completed.



For example—our process of "nibbing" the leaves of the spring together takes time and entails costly carefulness. We could save costs by simply putting a bolt through the center of the spring. Ordinary springs are thus made. But to do so sacrifices the strength of the spring.

Similar care marks the finishing of the point where spring weaknesses usually first show up—the spring "eyes." These are the points subjected to the *severest wear*. Lack of care in "eye" or bushing finishing often makes a difference of three years in the duration of *silence* in the spring. All our eye-bushings are of special bronze—ground to a diamond smoothness.

The Spring that Won't Squeak

The new patented Detroit Spring Self-Lubricating Device consists of a distributing reservoir in each leaf, loaded with long-life lubricant.

The Spring That Is Guaranteed For *Two* Years

One of the Standard Tests that Insure Detroit Spring Serviceability

Under the "capacity test" every Detroit spring must carry a fixed load at a fixed height—never less. This machine sees to it that this infallible law of D. S. P. manufacture is never infringed.

Write for our new book, finely illustrated and printed, telling the fact-story of Detroit Springs.

Detroit Steel Products Co.
2258 E. Grand Blvd. Detroit, Mich.
Manufacturers of Fenestra Solid Steel Windows—"The Standard of Industrial Daylighting."

Tests That Try Detroit Springs As No Load Or Road Ever Could

The "Initial Test" forces the assembled spring down again and again to test the *permanence* of its resilience. This test is many times more severe than actual road-service ever would be. It enables us to guarantee the springs for years against "settling."

Then comes a test unknown in other factories—the "Hardness Test"—that determines absolutely the texture strength required by our engineers.

And, finally, the "Capacity Test"—so severe that most people say it is unnecessary. This tries the spring to the extreme possibilities of emergency shocks and strains while carrying the "dead load" of the car plus the passenger capacity.

You take no chances because *we* take none.

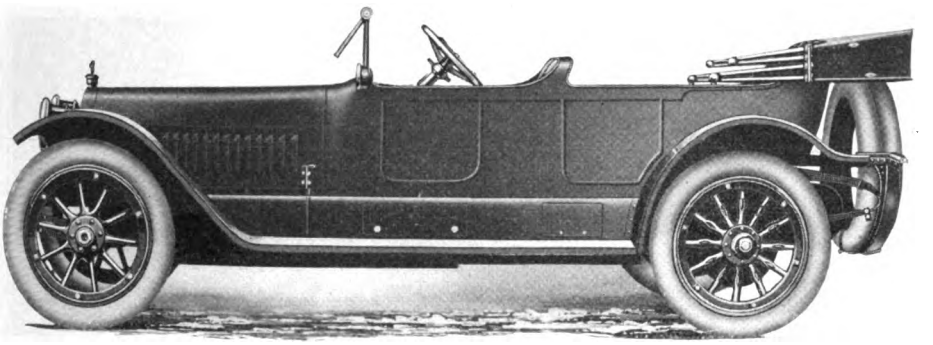
Purchaser and Dealer Alike Profit in Every Stearns-Knight Sale

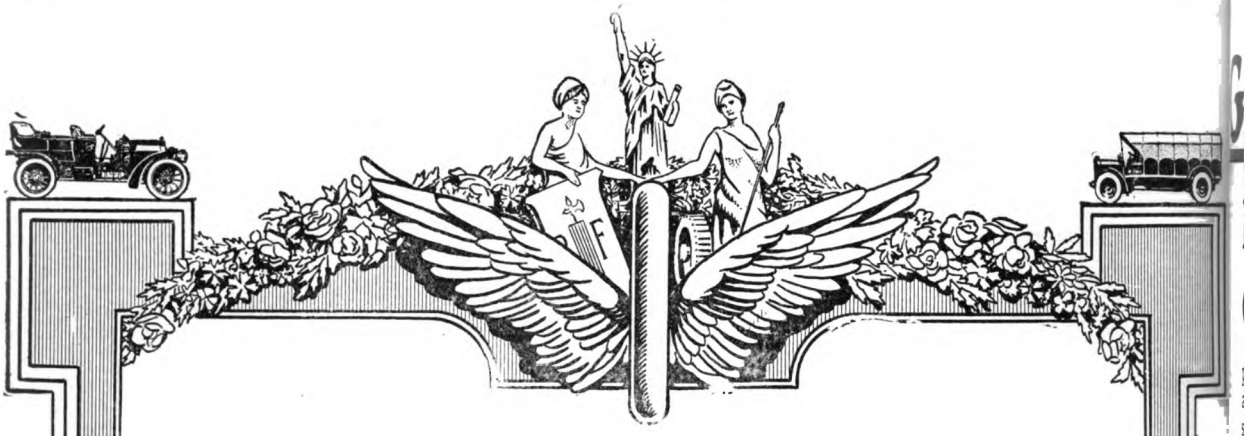


—the purchaser because his investment renders him maximum returns in satisfactory service with a minimum of upkeep and depreciation. The silent, vibrationless Stearns-Knight motor minimizes repairs and adjustments, and itself actually *improves with use.*

The dealer also profits by the owner's satisfaction—the latter's good will is a very real, if intangible, asset. Added to this is the immediate profit of the sale under the liberal Stearns contract, and the time-saving efficiency of the Stearns service organization.

Contracts are being closed for territory not previously allotted.

The F. B. Stearns Company



Cleveland Ohio

Stearns-Knight Six-Cylinder Six-Passenger Touring Car

This car is one of the new models added this year to make the Stearns-Knight line for 1914 even more complete than in previous years. The purchaser is allowed an exceptionally wide range of choice in body styles in either the four- or six-cylinder type—each attractive in its lines, superbly finished and luxuriously equipped.

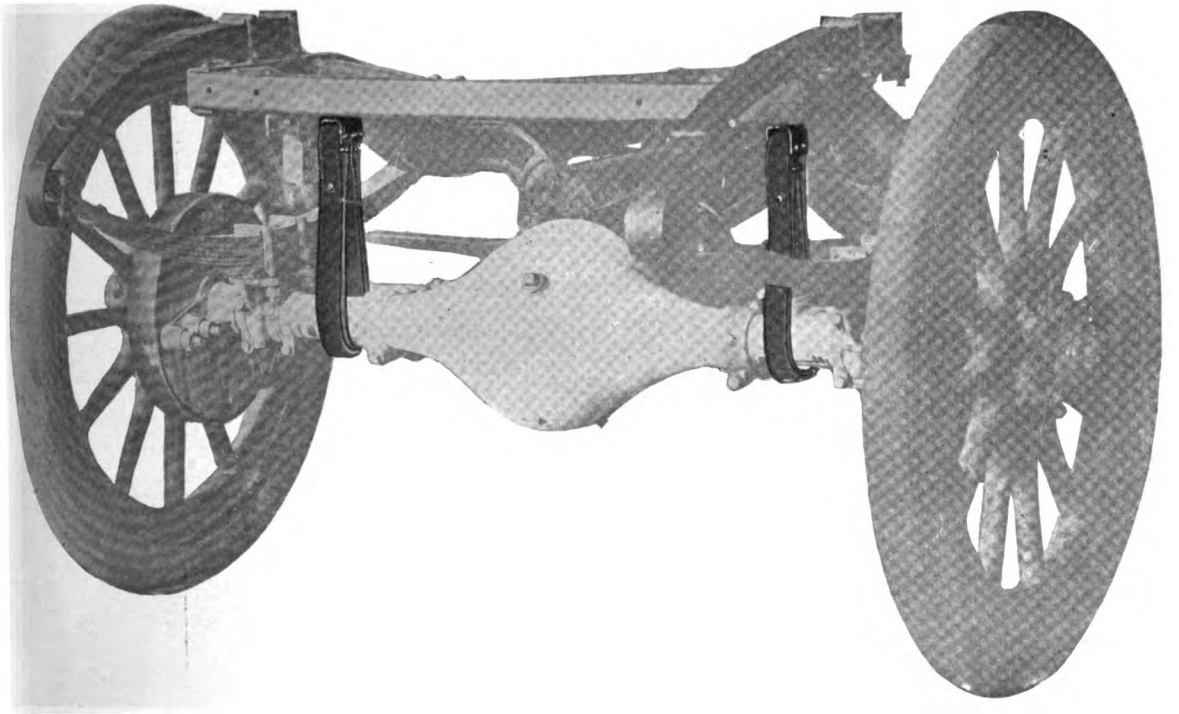
Gilmer Rebound Strap

IT'S the car's rebound which breaks springs—not how hard it "hits bottom" on rough roadways.

Gilmer Rebound Straps

prevent rebounds. They are made in lengths to fit all types of cars and are strong enough to resist the rebound of heavy cars as well as light. Each strap is tested to resist over 5,000 pounds strain.

¶ Gilmer Rebound Straps are made endless (without a weak place or joints) and woven from the best grade Fibre Cotton Yarn, water-proofed and weather-proofed.



¶ A positive year-long guarantee goes with each set of Gilmer Rebound Straps sold.

¶ Packard, Premier, Cadillac, Hudson, Hupmobile, Marmon, Chevrolet and Cartercar are among the American-made cars that have adopted Gilmer Straps as standard equipment because of their insurance against spring accidents and because of their superiority over leather straps.

¶ The best shock absorber on the market finds an efficient helper, in case of severe roadwork, in Gilmer Straps.

¶ Be sure to get our dealers' proposition, for it opens up a way for nice profits, and the insurance of your customers against spring breakage.

L. H. Gilmer Company, 52 N. Seventh St. Philadelphia, Pa.

Carburetor(?)Trouble

A MALADY most motorists suffer from is called "carburetor trouble." To obtain temporary relief from "carburetor trouble" is a comparatively simple matter; why bother about the cost. But, relief is not remedy; now think about the cost of relief. Just as a capable physician first administers relief to a suffering patient and then sets about curing the cause of his patient's affliction, so must carburetor trouble be handled.

The Ellis Gasolene Purifier

provides an efficient and lasting REMEDY for carburetor trouble. A diagnosis of carburetor trouble shows that the big bulk of such trouble is caused by impurities, such as dirt, grit, sediment, water, etc., in the fuel. The causes are of two kinds, solid substances, some of them infinitely small, and water, which is impossible to distinguish from gasolene, but both kinds of impurities capable of causing trouble.

The Ellis, by a series of screens and filters, catches every particle of solid substance that may get into the fuel. The presipitation chamber on the under side of the Ellis traps every bit of water, by a very simple application of the gravity method of separation. A handy arrangement allows periodical draining the purifier of the impurities; just a few turns of the thumb screw. No more sensible way of combating trouble can suggest itself than that of eliminating the cause. No more efficient insurance against carburetor trouble has ever been devised than the Ellis Gasolene Purifier. Send for one to try on your demonstrator or service car. It will soon prove itself worth many times the $3.50, its list price. We can offer a very attractive proposition to dealers. Write for it.

KELLOGG

FOUR CYLINDER AIR PUMP

The Selling Feature for 1914

In 1914 hand pumps must go. Car owners will no longer break their backs pumping tires or pay for continuous tire repairs caused by insufficient inflation.

The Kellogg Four Cylinder Air Pump is the selling feature for 1914. It is the standard tire pump. It has been used for years by the makers of the better cars—Packard, Peerless, Stevens-Duryea, Winton, Palmer-Singer, Stoddard-Dayton, Chalmers and many others. No other can boast our record.

Dealers and garages make money by installing the Kellogg Tire Pump. We are prepared to furnish attachments for equipping practically any car now in use.

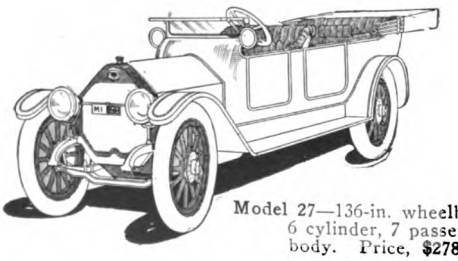
HAYNES



America's First Car

Is a Season Ahead In Improvements with the Vulcan Electric Gear Shift

The discriminating auto buyer is attracted to the Haynes like a magnet draws steel filings. He knows that another year will see a lot more cars adopting the electric shifting of the gears. That's why he's hunting up the Haynes dealer---hunting him up, mind you---and placing his order for the year-ahead Haynes.

The Wise Auto Buyer Is Looking for Just Such a Car as the Haynes

He deliberately looks for the car with the latest improvements. Improvements have been coming so fast, in the motor car industry, that not infrequently has a buyer of a new car made the startling discovery that the value of his car dropped 50% the minute it came into his hands. Why? Because new features were being brought out in other cars which were being demanded by the wise buyers of automobiles.

Model 27—136-in. wheelbase, 6 cylinder, 7 passenger body. Price, **$2785**

Without the Vulcan Electric Gear Shift

HAYNES

America's First Car

IS A WONDERFUL MACHINE

20 years of automobile engineering and constant improving, are embodied in the Haynes. It has a mechanical sturdiness and reliability that has been proved so often as to be a matter of record.

Year-in-advance equipment plus recognized reliability creates a combination that can't be beat.

No wise auto-buyer, of course, buys a car on the strength of one feature alone. But the Vulcan Electric Gear Shift in the Haynes car is backed by the strongest possible advantages in every other way.

Back of the Vulcan Electric Gear Shift is the greatest line up of advantages ever put into an automobile.

Specifications of the New Haynes

Motor—Bore 4¼ in., Stroke 5½ in. L-head Haynes. Cylinders cast in pairs. Model 26, A. L. A. M., 43.35 H. P., Dynamometer 65 H. P. Model 27, A. L. A. M., 43.35 H. P., Dynamometer 65 H. P. Model 28, A. L. A. M., 29.9 H. P., Dynamometer 48 H. P.
Weight—Model 26, 3800 lbs.; Model 27, 4000 lbs.; Model 28, 3400 lbs.
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Carburetor—Stromberg.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gurney Bearings.
Front Axle—I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Tires—Models 26 and 27, 36 x 4½. Model 28, 34 x 4.
Springs—Front Semi-elliptic 39⅛ x 2, rear 48 x 2.
Brakes—15¼ external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.
Body—Indiana Blue or Pacific Tour gray; chassis black; fenders black enamel.
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Cowl-board Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge, and speedometer. Models 26 and 27 have rim wind clock.
Other Standard Equipment—Top, top cover, mechanical tire pump, rain vision ventilating windshield, Vulcan Electric Gear Shift, two large electric head lights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 12 volt, 60 ampere hour storage battery, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim, and Collins curtains. Models 26 and 27 have shock absorbers.

Hand lever shift optional at $200 reduction.

The same amount of work you're devoting to a slow-selling car would put you on easy street, if you handled the Haynes.

Maybe there's still the chance for you to become a Haynes dealer with all the chance for big profits that it means.. Write and see if your territory is open.

Europe's Leading Car

Lancia

sells at AMERICAN PRICES

Town Coupe.
30 H.P.
Price $5500

The average would-be owner of a foreign car associates out-of-ordinary quality with prices beyond reason. He, in common with the majority of those who understand car value, wants such a car; but the prices of European products are prohibitive.

Lancia cars with all of the swing, dash and exclusive design, that only foreign designers and artizans can make possible, sell at American prices.

Lancia cars, made from steel that only Europe can turn out and with engineering features that America cannot touch, sell for American prices.

You, Mr. Dealer, have a market place for the Lancia, the car of durability, silence, flexibility, speed and rakish design. We will help you make your sales. Write and get our plan and proposition.

Utmost Quality

Proved by the Tire

Mr. Dealer, if your trade wants **the best in tires,** we want to tell you about Marathon.

We build in the **Utmost in Quality.** That's proved by the tire.

We factory-insure 4,000 miles service. And the tire's service to users, proves 4,000 to be the minimum. The average mileage is far above that figure.

Study these reasons:

Sea Island Fabric: We use nothing but Sea Island. That's the finest tire fabric obtainable. It's highest in tensil strength. It's the costliest fabric we can buy, but the cheapest for tire users—it gives utmost service.

Finest Rubber: We use only finest rubber in building Marathon. See the tire and you won't question that fact. We spare no expense to attain highest possible quality.

Hand Built By Experts: Marathon tires are hand built by expert tire men, very slowly. Hurrying is not permitted. This slow, exacting method costs us more—cuts our profit—but it insures **perfect construction.** It insures utmost service to users.

Concentrated Tread: Note how we heap up the tread rubber where the wear comes. That feature avoids waste. And it increases mileage.

Live Steam Single Cure: We single cure Marathon tires, in live steam. That gives unitized construction—makes all parts one. Tread and fabric separation are impossible. The live steam single cure also increases wear resistance.

Insured 4,000 Miles: The above are reasons how we factory-insure Marathon tires for 4,000 miles. And they are reasons why the average service is far above 4,000.

We absolutely guarantee every Marathon to give at least 4,000 miles. Motorists want this 4,000 mile tire. Do you see why you should sell Marathon?

COX OXYGEN CARBON CLEANER

New
Thorough
Quick
Inexpensive
Harmless
Efficient
Necessary
Profitable

The first really efficient and thorough method of cleaning carbon out of the cylinders is the new Cox Oxygen Carbon Cleaner. It consumes every particle of carbon, even in corners where it could never be scraped out, without the slightest possibility of harming the cylinders.

It takes from 6 to 10 minutes to clean each cylinder, averaging 30 minutes for a four-cylinder motor and 45 minutes for a six. Any workman can do it. Does not require experience or expertness. Absolutely safe to handle.

For Public Garages

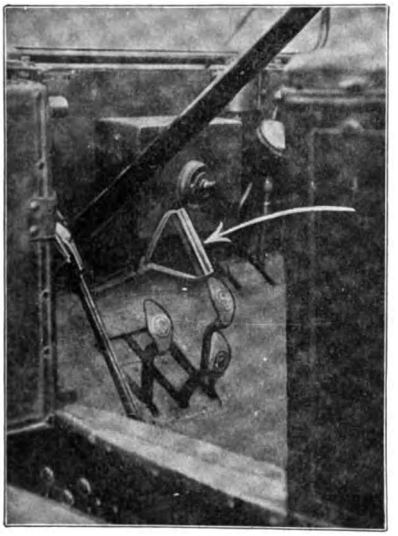
The profit possibilities for you in the Cox Oxygen Carbon Cleaner are only limited by the number of your customers. You do the work in one-tenth the time and only a fraction of the cost of any other method. Motorists will pay you well to clean their cars regularly. It is just as necessary as washing the car. This new method will quickly establish the custom of regular cleaning.

For Large Private Garages

For private garages in which more than one or two cars are kept, the Cox Oxygen Cleaner is a good investment. It pays for itself in the greater economy and improved running of the car.

Price and Selling Plan

The complete outfit costs $25. The tank is loaned—no charge made for same. You are charged only for the refills. Each tank contains sufficient oxygen for 35 to 40 cylinders. Refilling tanks costs $2.00. This is the only expense.



Write for information NOW.

Special Announcement
Mezger Plug becomes the
J-M (MEZGER) SOOT-PROOF SPARK PLUG

Sectional view. Note porcelain "petticoat" A A, extending to end of chamber.

In future the famous Mezger Soot-Proof Plug will be known as the **J-M** (Mezger) Soot-Proof Spark Plug, and sold exclusively by this company.

This is the **only** absolutely soot-proof spark plug on the market—the only plug that actually **cleans itself!** Therefore the only plug that **can not short-circuit.**

Soot can not accumulate at the firing point because the heat of the porcelain "petticoat," which extends to the end of the plug, burns up carbon as fast as it settles.

In other plugs the "petticoat" extends only part of the way down, leaving a large space for the accumulation of soot.

The porcelain used in this plug is proof against rapid changes of temperature. Even when heated red hot and thrown into water it will not crack—a much severer test than would be encountered in actual service.

These plugs have been on the market for over 12 years. Millions have been sold. Over 400,000 of America's finest cars are now equipped with them. Many have been in use for over 8 years and are still in service.

GUARANTEE

The J-M Plug is backed by a five-million dollar concern with a 55-year record for square dealing. If any plug does not give satisfactory service we will supply a new one or refund purchase price.

Sold by most dealers. Shipped direct from our nearest branch if your dealer can't supply. Price $1.00. Write nearest branch for interesting, illustrated booklet.

Dixon's Graphite Transmission Grease No. 677

Here is a grease for transmissions and differentials that is always just right. Changes in temperature don't affect its "body" materially. It flows with the gears without any drag, yet it won't run off when the gears stop. The fine graphite flakes unite with the gear and bearing surfaces, forming a durable veneer. And you have graphite-on-graphite contact instead of grinding, wearing metal-on-metal contact. "Lubricating the Motor," No. 23, explains.

BUDD ALL STEEL BODIES

represent the last word in the art of truck body building. They stand for strength, stability, sturdiness and efficiency. Made entirely of steel, they will not rot or crack. They cannot warp or split. They will stand the maximum use or abuse and are practically indestructible. They eliminate fire risk. They are light in weight and easy on tires—pleasing in design and attractive. Summed up in a word, they give the highest degree of Service.

They are made in many styles—of any desired capacity. Estimates promptly furnished. Write us today for full information.

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.

Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

One of Those Wrapped Tread Repairs That Outlast the Tire

The wrapped tread blow-out repair is the best for the motorist because it is stronger than any other and does not make an unsightly section on the tire.

It is the best type of repair for you to make because it is simple, and requires only about half as much material as the old sectional method. Anybody in your garage can make good wrapped tread repairs without a lot of experience, and **you can guarantee the job.**

SHALER Vulcanizers

are the only vulcanizers that use the wrapped tread method successfully because

1. They are the only vulcanizers that heat the tire from the inside and outside simultaneously.

2. They are the only vulcanizers which have a temperature control that is automatic.

Shaler Vulcanizers heat with steam or electricity. One of their biggest advantages is that you can start with a small equipment and increase it to keep up with your requirements. Shaler Vulcanizers will do every practicable kind of tire repairing.

Garage Managers:

Don't fail to write at once for a complimentary copy of the Shaler book, "Common Sense About Tire Repairs." It tells what you want to know about tire repairing and how to start a vulcanizing department. A postal will bring it by return mail.

Why don't you, too, sell

Vitalized Rubber

Diamond Tires

Squeegee Tread

Won't Skid

The Diamond Squeegee Tread is almost human in action.

The outside bars scrape off the grease and slime, the second bars dry the road surface, and the middle bars *grip* and *hold.*

The double thickness Squeegee Tread made of tough, road-resisting Vitalized Rubber insures a good, liberal mileage.

After the Squeegee Bars are worn from long service, there still remains a strong, thick, tough tread made of More Mileage Vitalized Rubber.

Long Wear

All types of Diamond Tires are made of Vitalized Rubber—a process that makes the tire tough enough to fight the road—elastic enough to absorb shocks.

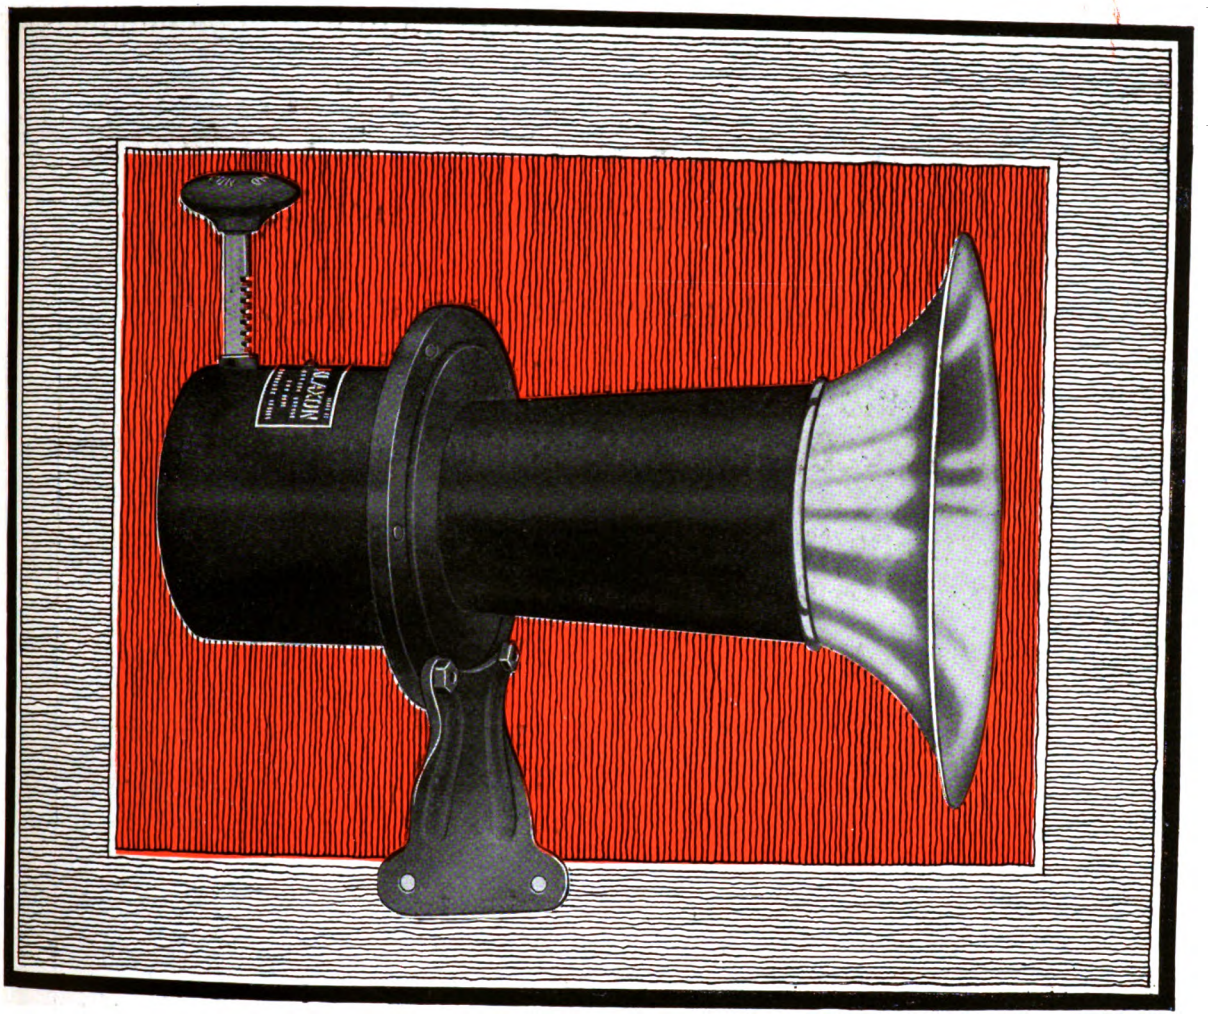
This is one of the reasons why Diamond Tires last longer—because they are built that way.

Honestly Built

Diamond Vitalized Rubber Tires have been put to the severest tests by motorists everywhere and have *made good.*

Built by expert tire builders, assisted by the latest improved machinery, made of fabric and rubber that is of the highest quality obtainable, backed by sixteen years successful tire building, money cannot buy a better tire today than the Diamond.

Selling Satisfaction



You need not hesitate to recommend and sell Diamond Tires. Among all the different tires made, the Diamond stands out prominently as the one that has delivered *maximum* mileage at *minimum* expense—the tire that makes good for everybody everywhere.

Why continue experimenting when you can sell a tire that will *satisfy* and *hold* your trade—Diamond Tires.

Equip with Diamond Tires

BEST FOR AUTOMOBILES, BICYCLES AND MOTORCYCLES

Digitized by Google

The Hand Klaxon, $10

THE HAND KLAXON is not entirely new. It is a development of the original Hand Klaxon manufactured in 1909 and since then gradually discontinued owing to the large demand for motor driven Klaxons.

The Hand Klaxon operates on the Klaxon principle of a steel diaphragm set in violent vibration by a toothed wheel. In the electric Klaxon this wheel is rotated by means of an electric motor; in the Hand Klaxon by a train of gears that attain high speed under pressure on the push-rod.

The Hand Klaxon has the true Klaxon note and is sold under the regular Klaxon Guarantee of permanent satisfaction.

Klaxon quality is built into the Hand Klaxon. With the Klaxon reputation to sustain it is obvious that we cannot afford to put the Hand Klaxon on the market unless it is vastly superior to any other mechanical signal at present in use.

The price of the Hand Klaxon is $10. Orders accepted November 1st; deliveries will begin December 1st.

Packard Motor Trucks

We are the largest motor truck manufacturers in the world.

We are not assemblers—we actually make our goods. We stand behind our goods. We would not make what we could not stand back of.

We sold $4,000,000 worth of Packard trucks in the last year.

Our permanent success depends upon what our patrons say of our vehicles.

ASK THE MAN WHO OWNS ONE

In the motor trucks and cars built by the Packard Motor Car Company, no measure shall be used except the standard of such perfection as the art affords.

It is a hard, mechanical fight to make a perfect truck. Evolution is the process. Packard motor vehicles are a logical development, based on fourteen years of engineering progress.

The carrying of merchandise at minimum cost is the essence of truck efficiency. We know our business—it is to do your hauling in the cheapest and most satisfactory manner.

Packard trucks are built in five sizes—two, three, four, five and six tons. We can supply the type of body to meet your requirements.

Packard trucks are used in 172 lines of trade.

BERRY BROTHERS' VARNISHES

TRADE LIONOIL MARK

BERRY BROTHERS' VARNISHES

RUST—METAL'S WORST ENEMY—CONQUERED BY LIONOIL

Rust on metal parts is each day costing the American automobile manufacturer thousands of dollars besides greatly lessening the standard of his product.

No metal body can be finished perfectly if at any time it has been rusted. It is absolutely essential that the surface be free from any spots. Lionoil is the world's greatest rust preventive. Bodies coated with Lionoil when in use show no tendency to peel, check or flake off.

Any metal part such as springs, axles, frames, fenders, lamps and all sorts of stampings and forgings, are absolutely insured against rust if coated with Lionoil.

Lionoil can also be used as the liquid ingredient for Metal primer or "roughstuff." We can also furnish Lionoil metal primer ready mixed.

Lionoil is also a great labor saver. It pays for itself easily in labor and metal saved. It is not expensive, covers lots of surface and air-dries quickly.

Write us for information regarding Lionoil or any of our other products such as the Raven line of black Japans for lamps, bonnets, top bows and other parts. We have a large corps of experts who specialize on finishing problems. Write for information.

Firestone

Faith and Reason
—Both Big Factors in the Choice of Firestone Tires.

FIRESTONE enthusiasts are of two kinds—the man who knows reasons and the man who accepts results. Both have confidence in the steadiness and sturdiness demonstrated over and over again on track and tour.

One man knows the value in the thickness of tread, its extra "give" and "life," the sharp edges, abrupt angles, deep hollows in the "non-skid" lettering.

He realizes that the Firestone in-built mileage which carries men to victory in the race will be his to command on every road.

But—the other man simply depends on the experience of his friends, added to Firestone racing laurels, and he stands pat on the Firestone showing of Most Miles Per Dollar.

Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of these inspection stamps. When filled with any substitute for air or attached to any other rims than those specified, our guarantee is withdrawn.

MOTOR WORLD

Vol. XXXVII New York, U. S. A., Thursday, October 16, 1913 No. 4

COLBY TO BE MERGED IN A MINNEAPOLIS ENTERPRISE

Iowa Car Manufacturer and Minnesota Motorcycle Maker Nucleus of New $6,000,000 Company — Big Things Planned.

For the purpose of acquiring the Colby Motor Co., of Mason City, Iowa, and the Minneapolis Motor Co., of Minneapolis, Minn., the Standard Motor Co. has been organized in the latter city, where it is stated it will erect a $3,000,000 plant.

The parties to the deal and the incorporators of the Standard Motor Co. are W. M. Colby, president of the company bearing his name, and C. H. McNider, president of the First National Bank of Mason City, and P. M. Starnes, F. E. Kenaston and F. E. Starnes, president, vice-president and secretary, respectively, of the Minneapolis Motor Co., which heretofore has manufactured motorcycles only. In addition to his holdings in the latter, Kenaston is also president of the Minneapolis Threshing Machine Co., and P. M. Starnes vice-president of the American Timber Holding Co. Others concerned in the transaction are M. J. Scanlon and S. H. Bowman, two prominent Minnesota lumber men.

It is the purpose of the new company to manufacture pleasure cars and light delivery wagons on a large scale, but whether it will continue the manufacture of the Minneapolis motorcycle has not yet been settled.

Most of the same men figure as the corporators of the Twin City Motor Co., which was incorporated last week with authorized capital of $6,000,000, under the laws of Delaware. Its relation to the Standard Motor Co. is not clear.

U. S. L. President Again Goes Abroad.

For the second time this year, J. Allen Smith, president of the United States Lighting & Heating Co., has crossed the ocean on business intent. He sailed on Saturday last, 11th inst., to Europe to close up several deals which are pending there, some of which have to do with the U. S. L. starting and lighting system. He will probably remain abroad until after the London and Paris shows.

To Build Electrics on the Coast.

Due to the initiative of Volney S. Beardsley, one-time president and general manager of the Auto Vehicle Co., of Los Angeles, a serious effort will be made to manufacture electric vehicles on the Pacific Coast. It already has taken practical shape in the organization of the Beardsley Electric Co., which will set up a plant in Los Angeles, the necessary equipment recently having been purchased in the East.

Beardsley will be president and manager of the company, Watt L. Moreland, of the Moreland Truck Co., of Los Angeles, vice-president; M. Elsasser, a Los Angeles capitalist, second vice-president; Arthur Wright, secretary; John T. Shannon, electrical engineer; Charles H. Sorg, superintendent. The company will produce pleasure vehicles, which will include, it is stated, an entirely original control mechanism in addition to several other exclusive features.

Dayton Truck Admits Bankruptcy.

Hard hit by the flood last spring, from the effects of which it failed to recover, the Dayton Auto Truck Co., of Dayton, Ohio, filed a petition in bankruptcy on Saturday last, 11th inst., listing its liabilities at $216,165.77 and its assets at $67,720.

Its president, R. T. Johnston, is the heaviest creditor. He holds the company's notes to the value of $113,773.85, and there is also due him on account $41,397. Other large creditors are the Wisconsin Motor Mfg. Co., of Milwaukee, $10,141, and John Klee, $16,000. Of the debts, $196,440 are unsecured and there are liabilities to the amount of $10,725 for indorsements. Of the assets, $52,720 is represented by outstanding accounts, $14,000 by factory leasehold and buildings and $1,000 by machinery.

BONDS OVERDUE, RECEIVER ASSUMES CHARGE OF MASON

Action Precipitated by Refusal of Iowa Company's Creditors to Grant Extension—Its President Remains Hopeful.

Its creditors having refused to grant an extension, and having failed to meet its bonds at maturity, to say nothing of overdue interest thereon, the Mason Motor Co., of Waterloo, Ia., has been placed in the hands of Ira J. Hoover as receiver. Action was taken on application of F. W. Powers, trustee for the bondholders.

The bonds outstanding amount to $100,000 and in addition there is interest due on $36,000 since July 1, 1913, and on $64,000 since January 1, 1912.

The Mason Motor Co. is the successor of the Maytag-Mason Co., which became financially involved late in 1911, when, as a means of extricating it from its difficulty, bonds to the amount of $150,000 were issued, of which $50,000 since have been retired.

Despite the black outlook, E. R. Mason, president of the company, has not entirely lost hope of saving the property. He puts most of his faith in an offer he has made to the creditors of preferred stock for the amount of their claims and a bonus of common stock out of his own holdings and those of M. Dusenberg, who, with Mason, are the largest holders of the common, the proposal carrying with it the retirement of a large proportion of the Mason-Dusenberg stock. Mason also is seeking to organize a syndicate for the purpose of taking over and continuing the business.

In case neither of his plans come to a head, the bondholders will, of course, foreclose on the property and it will be offered for sale.

Although rarely seen in the East, except on race tracks, the Mason car has given a good account of itself in the West, the output, however, being limited.

55 FEWER M. A. M. MEMBERS ACCOUNT FOR MORE SPACE

Despite Absence of Many Notables, Accessory Displays at Both Shows Will Be Larger Than Ever—Those Who Will Exhibit.

Despite the withdrawal of all the tire, axle and bearing manufacturers included in the membership of the Motor and Accessory Manufacturers, Inc., and although there were 55 fewer applicants than last year, when, on Thursday last, 9th inst., that organization made its allotments for the New York show in Grand Central Palace next January, it accounted for 19,000 square feet of floor space, 2,000 square feet more than the members occupied in the 1913 show.

The number of exhibitors who will share the increase is 103, as against 158 who exhibited last January when the New York show occupied both Grand Central Palace and Madison Square Garden and ran for two weeks. Of the 103, all except 11 will exhibit also at Chicago, where the M. A. M. members will occupy 20,000 square feet of floor space, an increase of 1,000 square feet. At Chicago last year, 149 M. A. M. members displayed their wares, of whom 110 did so during the first week only. On the forthcoming occasion, 106 will exhibit in the Windy City, 14 of whom will not appear in New York.

Those members to whom space was allotted are as follows:

American Bronze Co., American Hardware Corporation, Apple Electric Co., Automobile Supply Mfg. Co.

Badger Brass Mfg. Co., Benfold Mfg. Co., John W. Blackledge Mfg. Co., S. F. Bowser & Co., Breese Carburetor Co.,* Brown-Lipe-Chapin Co., Buda Co., Edw. G. Budd Mfg. Co., Byrne, Kingston & Co.

Carnegie Steel Co.,* F. S. Carr Co., Champion Ignition Co., L. C. Chase & Co.,* Coes Wrench Co.,* Adam Cook's Sons, C. Cowles & Co., William Cramp & Sons Ship and Engine Building Co.

The Dean Electric Co., Detroit Electric Appliance Co., Detroit Lubricator Co., Joseph Dixon Crucible Co., Doehler Die Casting Co., Double Fabric Tire Co., John L. G. Dykes Co., Dyneto Electric Co.

Edison Storage Battery Co., Edmunds & Jones Mfg. Co., Electric Auto-Lite Co., Electric Storage Battery Co.

Findeisen & Kropf Mfg. Co., Gabriel Horn Mfg. Co., Garage Equipment Mfg. Co., Gemmer-Detroit Starter Co., Globe Machine and Stamping Co., Gray & Davis.

A. W. Harris Oil Co., Hartford Machine Screw Co.,* Hartford Suspension Co., Geo. A. Haws,* Hayes Mfg. Co., Heinze Electric Co., Herz & Co.,* Hoffecker Co.

Ignition Starter Co., International Acheson Graphite Co.

J-M Shock Absorber Co., Janney-Steinmetz & Co.*

Kellogg Mfg. Co., Atwater Kent Mfg. Works.

Leather Tire Goods Co., Light Mfg. & Foundry Co.,* Link-Belt Co.*

Manufacturers Foundry Co.,* C. A. Mezger, A. R. Mosler & Co., Motometer Co., Motsinger Devices Mfg. Co.

National Coil Co., National Lead Co., National Tube Co., New York and New Jersey Lubricant Co., North East Electric Co.

Oliver Mfg. Co., The Pantasote Co., G. Piel Co., Randall-Faichney Co., Remy Electric Co., Reynolds-Browne Co., Rose Mfg. Co., Royal Equipment Co.

J. H. Sager Co., Schoen-Jackson Co., A. Schrader's Son, Inc., Schwarz Wheel Co., C. A. Shaler Co., Simms Magneto Co., Sireno Co., F. W. Spacke Machine Co.,* Sparks-Withington Co., Spicer Mfg. Co., Splitdorf Electrical Co., Springfield Metal Body Co., Standard Thermometer Co., Standard Welding Co., Stewart & Clark Mfg. Co., Stromberg Motor Devices Co.

Torbensen Gear & Axle Co., U. S. Light & Heating Co., Vacuum Oil Co., Valentine & Co., Veeder Mfg. Co., Vesta Accumulator Co., Voorhees Rubber Mfg. Co.

Warner Gear Co., Warner Mfg. Co., Weed Chain Tire Grip Co., Westinghouse Electric & Mfg. Co., Wheeler & Schebler, the White & Bagley Co., Willard Storage Battery Co.

Exhibitors denoted by an asterisk, 11 in number, will exhibit in New York only; those undenoted will exhibit in both New York and Chicago, and the following 14 will exhibit in Chicago only:

Auto Parts Mfg. Co., Baldwin Chain & Mfg. Co., Continental Motor Mfg. Co., Cotta Transmission Co., Diamond Chain & Mfg. Co., Gould Storage Battery Co., Hess Spring & Axle Co., Imperial Brass Mfg. Co., Lovell-McConnell Mfg. Co., McCord Mfg. Co., Rutenber Motor Co., Waukesha Motor Co., Whitney Mfg. Co., Ward Leonard Electric Co.

Chester Proposes to Produce Tires.

The Chester Rubber Tire & Tube Co., which recently was incorporated under the laws of West Virginia, will locate in Chester, Ohio, where it has acquired a former car barn and machine shop at Ninth street and Carolina avenue. Meanwhile, it is endeavoring to dispose of stock in order to secure the necessary capital to commence operations. The officers of the company are: John E. Newall, president; George Arner, vice-president; George Hasson, secretary; A. L. Skinner, treasurer.

PERLMAN CHARGES STANWELD WITH PATENT INFRINGEMENT

One-Time "Motor King" Bobs Up With Rim Patent Which He Is Said to Regard as Comprehensive—Attorney Silent.

Louis H. Perlman, who is best remembered by the metropolitan trade as the man who once styled himself "The Motor King," has again appeared in the limelight after an absence of several years; this time he appears as a patentee and has filed a suit in the United States District Court for the Southern District of New York against the Standard Welding Co., of Cleveland, O., maker of Stanweld rims, which he claims is infringing a rim patent which he took out February 4, 1913, under the number 1,052,270.

Just what there is to Perlman's claim is not made clear by his complaint beyond the fact that his patent covers a demountable rim, but it is understood that he claims important basic properties and a broad field. His attorney said he did not care to discuss the nature of the invention.

Whether it is as was said by one man, that the patent "covers nearly all the rims ever made," is problematical, but Perlman is said to regard his invention as sufficiently inclusive to come into close contact with several well known types.

Packard to Add Six Millions.

At a special metting of the stockholders of the Packard Motor Car Co., which is to be held in Detroit today, it is probable that the capital stock will be increased from $10,000,000 to $16,000,000. The new stock will be equally divided into common and seven per cent. preferred.

In connection with the increase, it is proposed to distribute $2,000,000, par value, of the new common stock as a stock dividend among present owners of the company's common stock. It is understood the holders of common stock will be asked to waive their right of subscription to the remaining $1,000,000 of new common stock and the $3,000,000 of new preferred stock, these to be retained for the present as treasury stock to be placed with selected purchasers not now identified with the company.

New Date Set for Cutting Sale.

The trustee's sale of the Cutting Motor Car Co.'s plant in Jackson, Mich., which was to have occurred on the 6th inst., has been postponed until Wednesday next, 22nd inst. The appraised value of the property is approximately $175,000, subject to incumbrances of about $30,000.

U. S. MOTOR MEN'S CLAIM TO "BONUS" GOOD, SAYS COURT

Three Former Vice-Presidents Entitled to Sums Promised in Excess of Salaries — Employes' and Other Claims Adjudicated.

The "participation" or "bonus" or whatever it is that Alfred Reeves, Horace DeLisser and J. W. Wellington claimed they were promised by the United States Motor Co., of which they were at one time vice-presidents, is a claim which should be paid, according to a decision of the United States District Court for the Southern District of New York, which this week was called upon to pass upon the decisions of a master who had been appointed to hold hearings on certain claims. The money for which the trio asked was a sum to be paid in excess of their salaries, but a hitch developed when the receivers were appointed. The master allowed their claims and the court affirmed his decision.

Five employes—Christian Prouty, John A. Moore, William H. Tether, Alfred R. Gormully and William R. Devine—were also adjudged entitled to pay during the latter days of their connection with the big corporation. The master had ruled favorably to them. A claim of the Hartford Machine Screw Co. was reduced to $820 and passed. Claims by Frank Seaman, Inc., and the Prosser Engineering Co. were announced as settled out of court.

Affirmance was given to the master's decisions in regard to claims of the Manufacturers' & Traders' National Bank, the Detroit, Grand Haven & Milwaukee Railroad Co., P. H. Gill & Sons' Forge & Machine Works, the New York Wire & Spring Co., the Hartford Suspension Co. and the Ball & Roller Bearing Co.

Beautiful Bubble Bursts in Iowa.

After painting gorgeous pictures for more than two years, and promising fortunes to all who purchased its stock, the Western Implement & Motor Co., of Davenport, Ia., capitalized at $5,000,000, of which, at last reports, W. H. Haskell was president, finally has gone into the hands of a receiver.

Originally the company proposed to build motor cars and trucks and agricultural tractors on a huge scale, using, as a nucleus, an Iowa automobile factory, but the owner of it grew wise in time and the gigantic scheme, which included the creation of a model industrial village, underwent reorganization. It abandoned its automobile intentions, but continued to paint the glories of agricultural tractors and cotton pickers to such good purpose, it is stated, that something like $300,000 worth of stock was disposed of to confiding persons, the country having been flooded with literature pointing out the handsome profits that might some day accrue. W. T. Waterman is the name of the receiver in charge.

Reo Reports Surplus of $2,000,000.

According to the statement, rendered at its annual meeting on Thursday last, 9th inst., the Reo Motor Car Co., of Lansing, Mich., has a surplus of $2,061,887.40. Its total assets are $4,217,474.20. Aside from $2,000,000 capital stock and the surplus, its current liabilities are but $150,586.80. The statement, as rendered to the stockholders, is as follows:

Assets

Capital assets:		
Real estate, buildings, machinery, plant equipment and other assets		$2,019,356.17
Current assets:		
Inventories, accounts receivable, etc	1,312,734.42	
Cash on hand and in banks	885,383.61	
		$4,217,474.20

Liabilities

Capital stock, 200,000 shares of par value of $10 each	$2,000,000.00
Current liabilities	155,586.80
Surplus account	2,061,887.40
	$4,217,474.20

Willys-Overland Earnings, $5,700,000.

Figures released preliminary to its annual report show that for the fiscal year which ended June 30, 1913, the net earnings of the Willys-Overland Co. amounted to $5,705,537. Tabulated, the preliminary figures are as follows:

Net earnings from operation of all companies, after deducting all expenses, including an adequate allowance for accruing renewals and depreciation		$5,705,537
Interest on notes and accounts receivable, etc	176,829	
Total income	5,882,367	
Interest on floating debt	228,468	
Surplus	5,653,898	
Preferred dividend	350,000	
Surplus	5,303,898	

Grant May Leave Detroit for Dayton.

Negotiations between the Grant Motor Co., of Detroit, and the Greater Dayton Association, of Dayton, O., are in progress and may result in the removal of the Grant plant from Detroit to Dayton. Officers of the Grant company have made a number of visits to Dayton and, it is stated, have practically decided on one of several sites.

Firestone Locates a Branch in Rochester.

The Firestone Tire & Rubber Co. has opened a branch in Rochester, N. Y., at 1223 East avenue. It is in charge of Philip Hensen, who previously was connected with the Firestone branch in Buffalo.

PROBING ADDS TO ODOR FROM MICHIGAN BUGGY'S FAILURE

Bales of Undated Notes and "Inside Deal" with Gerber, of Pittsburgh, Uncovered—Piling Blame on Palmer.

Those dealers' notes which enabled the Michigan Buggy Co., of Kalamazoo, to keep afloat so long continue to be one of the wonders, or one of the scandals, of the investigation which has been in progress by the trustee in bankruptcy during the past three weeks.

M. H. Lane, the former president of the company, who, after 28 years, was ousted from the presidency and "kicked upstairs" by being made chairman of the board; Frank B. Lay, Jr., sales manager and one of the participants in the "velvet" payroll which was charged to advertising, and most of the chief accountants and bookkeepers of the bankrupt and looted company gave testimony, in all of which the dealers' notes figured prominently.

As stated in Motor World long before the rottenness became public property, these notes were given by dealers for the total amount of their contracts and were discounted by the banks whenever the Michigan company found it necessary to raise cash, which was often. The latest testimony made it appear, however, that a surprising number of dealers not only thus made what amounts to large advance payments but signed notes without dates, thereby enabling the notes to be dated by the Michigan officials whenever it was desired to negotiate them.

There was an astonishing amount of ignorance displayed concerning not only these notes, of which at times there were approximately $1,000,000 on hand, but other things, everyone shifting the blame to Victor L. Palmer, the secretary-treasurer and general manager of the company. He appears to have been its financial "genius," even former President Lane stating that he knew little or nothing about the company's finances, having entrusted them almost wholly to Palmer, who proved an adept manipulator. The Pennsylvania Sales Co., of Pittsburgh, of which E. F. Gerber is the head, appears to have been one of Palmer's pets. Choice contracts with him were executed and notes for enormous amounts accepted in payment, a grand clean-up sale to Gerber at less than cost being one of the arrangements effected shortly before the crash came.

One of the accountants admitted that $860,000 in undated notes was on hand at one time, but he could not explain why there were four or five times as many

Digitized by Google

notes on hand as there were existing contracts. The notes, it seems, were not entered on the books at the time contracts were secured, but when they were entered after discounting they were listed as bills receivable and considered an asset.

E. J. McCone, one of the bookkeepers, testified that one of Gerber's employes approached him and offered him "his own price" for a copy of the Michigan company's list of creditors which had been prepared for the receiver; McCone, however, refused the temptation. He also said that he once threatened to quit rather than make an entry as Palmer wanted it made.

While on the stand, former President Lane stated that after he was made chairman of the board he was sidetracked and was not even notified of meetings, becoming practically a nonentity, Palmer even instructing the postoffice officials that all mail be delivered to him personally. Frank B. Lay, Sr., his brother-in-law, who succeeded him as president, approached Lane last July, when matters were coming to a crisis, and endeavored to induce him (Lane) to mortgage his home in order to raise money to postpone the crash. Lane's inquiries, however, disclosed that E. F. Gerber, of Pittsburgh, was a heavy debtor but, despite the fact, at the first meeting that he (Lane) had been permitted to attend for months Gerber presented a contract for 400 automobiles at give-away prices, which the other directors favored but which Lane and the elder Lay opposed. Lay's two sons, who are also deeply involved in the scandal, then left the room, breaking the quorum; nevertheless, Lane discovered later that the 400 cars had been sold to Gerber, the cars being ordered shipped from other agencies which had them on hand. They were sold, it appears, for about half their actual cost.

When on the stand, Frank B. Lay, Jr., added little to the general fund of information. He admitted that on one occasion he sold a car while in Toledo and received $1,000 in cash which he declared he spent for golf balls, clothing, meat and groceries.

The investigation is still in progress, but the criminal inquiry will not be undertaken until October 21st, when the grand jury and special prosecutor appointed for the purpose will begin their work.

Many stories are afloat concerning V. L. Palmer and his doings, one of the most picturesque having to do with the impression made on his vanity by a Kalamazoo newsboy who once called him "Victorious Leader Palmer." It tickled Palmer so greatly that he took the boy into the company's employ and placed him in charge of the mail's distribution at a weekly salary of which he had never dreamed. Palmer's protege is said to have lorded it around the place in a surprising manner.

MAXWELL'S BALANCE SHEET GIVES SEVEN MONTHS' TOTAL

Deals Only with Assets and Liabilities and Not with Income—Good-will Still Remains Towering Item —Statements Compared.

No one will be able to obtain much information, or more satisfaction, from the balance sheet of the Maxwell Motor Co., whose fiscal year ended July 31st and whose statement just has been made public.

The chief outstanding item is the valuation placed on good will, patents, etc. It is carried on the books at $26,500,000, representing very much more than half of the company's assets, which total $41,002,563.63. On January 31 last they were estimated at $46,753,668.08, according to a statement rendered "in advance of the full completion of the plan of organization."

As the company was not incorporated until December 31st, 1912, the present report covers only a period of seven months, and makes no reference to even gross sales, income or earnings.

The chief tangible assets—real estate, buildings, machinery and equipment—are valued at $7,032,554.17, but only four of the plants are operating, and the remainder are idle and subject to sale.

The inventories foot up $4,837,905.89, but as $2,371,109.69 is reserved for depreciation thereon the net inventory value is really but $2,466,796.20.

Notes and accounts receivable amount to $739,390.67, and there is $1,042,324.89 in cash, the total assets, exclusive of good-will, etc., being $14,502,653.63.

Of the liabilities, $35,313,954.50 is represented by outstanding stock. Of the remainder, $4,537,001.77 is represented by reserves for depreciation on buildings, inventories, etc., and $490,174.01 by accounts payable, the total liabilities being $41,002,563.63.

The balance sheet and its comparison with the January 31st figures follows:

	July 31, 1913.	Jan. 31, 1913.
Assets		
Capital assets:		
¶Real estate, buildings, machinery and equipment	$7,032,554.17	$9,026,330.72
Investments	667,572.35	680,056.36
	$7,700,126.52	$9,706,387.08
Goodwill, models, patents, trade marks and trade names	26,500,000.00	26,849,880.44
Current and working assets:		
‡Inventories	4,837,905.89	5,415,339.26
Branch house assets (in course of liquidation)—net value	151,066.31	.....
Notes and accounts receivable	739,390.67	2,274,003.65
Prepayments	32,749.35	77,866.55
†Cash	1,041,324.89	2,430,191.10
	$6,802,437.11	$10,197,400.56
Total assets	$41,002,563.63	$46,753,668.08
Liabilities		
Capital liabilities:		
*First preferred	$13,000,000.00	$13,000,000.00
Less—in treasury	670,863.66	
	$12,329,136.34	
Second preferred	11,000,000.00	11,000,000.00
Less—in treasury	822,863.66	
	$10,177,136.34	
Common	13,000,000.00	13,000,000.00
Less—in treasury	192,318.18	
	$35,313,954.50	
Deferred liabilities:		
Real estate mortgages	134,705.85	156,342.50
Current liabilities:		
Accounts payable	306,757.34	
Accounts payable—unvouchered invoices	183,416.67	
	$490,174.01	
Wages—accrued	88,463.26	
Taxes, insurance, etc., accrued	29,177.47	
Customers' deposits on cars and parts purchased	102,885.45	
	$710,700.19	1,135,592.64
Reserve for depreciation of capital assets:		
On buildings, machinery and equipment	1,960,040.30	3,598,760.70
Reserve for depreciation of current and working assets:		
On inventories	2,371,109.69	3,594,521.21
On notes and accounts receivable	205,851.78	1,103,140.43
	$2,576,961.47	$4,697,761.64
Reserve for establishment of business, expenses applicable to prior period, and other items	306,201.32	1,165,201.60
Total liabilities	$41,002,563.63	$46,753,668.08

¶The Capital Assets represented by real estate, buildings and machinery include all plants. The company is operating only four of said plants; the remaining plants are subject to sale.

‡The total inventory, as noted above, less the reserve set up for depreciation, would leave a net inventory valuation of $2,466,796.20. One-third of this amount represents active material for new models and two-thirds represents active repair parts for new and old models.

†The Reorganization Committee and the receivers of the predecessor companies together hold $444,698.15 cash, in addition to the sum of $1,041,324.89 shown above. The balance, if any, of this $444,698.15, after their requirements, will be paid over to this company.

*Company incorporated December 31, 1912. Dividend on first preferred stock cumulative at seven per centum per annum from January 1, 1913. No dividend declared or paid.

The Week's Incorporations

Chicago, Ill.—Rayfield Mfg. Co., under Delaware laws; authorized capital, $1,500,000.

Detroit, Mich.—Commercial Garage, under Michigan laws; authorized capital, $10,000; to operate a garage.

Chicago, Ill.—Kerosene Carburetor Co., under Illinois laws; authorized capital, $20,000. F. D. Bassett, E. G. Gossett, E. G. Atkins.

Chicago, Ill.—Standard Fender Co., under Illinois laws; authorized capital, $250,000. Corporators—F. H. Escher, C. C. Jensen, M. J. Roberts.

Dayton, Ohio—Parker Auto Repair Co., under Ohio laws; authorized capital, $5,000. Corporators—Guy F. Hall, L. V. Browne, H. R. Marquis.

Great Falls, Mont.—Standard Garage Co., under Montana laws; authorized capital, $30,000; to operate a garage. Corporators—H. J. Griffith and others.

New York, N. Y.—Motor Materials Co., under Delaware laws; authorized capital, $100,000. Corporators—F. C. Fearing, R. H. Robbins, B. A. Wordemann.

Minneapolis, Minn.—Twin City Motor Co., under Delaware laws; authorized capital, $6,000,000. Corporators—F. E. Kenaston, S. H. Bowman, M. J. Scanlon.

Muncie, Ind.—B. T. K. Gear & Engine Co., under Indiana laws; authorized capital, $100,000. Corporators—Francis M. Boyer, Alta Boyer, J. P. Kandel and others.

Fort Worth, Tex.—A. P. Mitchell Auto Co., under Texas laws; authorized capital, $15,000. Corporators—A. P. Mitchell, E. M. North, E. I. Malone, all of Fort Worth.

Detroit, Mich.—Detroit Cyclecar Co., under Michigan laws; authorized capital, $100,000; to manufacture motor vehicles. Corporators—Arthur M. Thomas, P. H. Cale.

Pittsburgh, Pa.—Spring Cushion Tire Corporation, under Delaware laws; authorized capital, $300,000. Corporators—W. I. N. Lofland, J. S. Collins, Jr., W. F. P. Lofland.

Toronto, Can.—Bosch Magneto Co., Ltd., under Canadian laws; authorized capital, $25,000; to manufacture machinery. Corporators—F. D. Norman, W. J. Boland and others.

Brockton, Mass.—White Automobile Co., under Massachusetts laws; authorized capital, $30,000. Corporators—Boland Litchfield, Samuel J. Freedman, Pauline H. Simons.

Chicago, Ill.—Ross Sleeve Motor Co., under Illinois laws; authorized capital, $20,000; to manufacture motors, engines, etc. Corporators—F. W. Bull, E. Lundbland, A. S. Lytton.

Montreal, Can.—Major Automobile, Ltd., under Canadian laws; authorized capital, $50,000; to manufacture motor cars. Corporators—George A. Major, Alexis Frappier and others.

Chicago, Ill.—Dimmer Co. of America, under Illinois laws; authorized capital, $21,000; to manufacture motor car devices, etc. Corporators—A. A. Pentelis, O. O. Weidner, John H. Lally.

Detroit, Mich.—Cowles-McDowell Preumobile Co., under Michigan laws; authorized capital, $4,000,000; to manufacture motor cars. Corporators—Irving Cowles, E. H. MacDowell and others.

Cincinnati, Ohio.—Berk Mfg. Co., under Ohio laws; authorized capital, $1,000; to manufacture automobile accessories. Corporators—E. P. Berk, Dora Berk, E. J. S. Berk, H. H. Berk, A. H. Berk.

Philadelphia, Pa.—Quality Rubber & Auto Supply Co., under Delaware laws; authorized capital, $25,000. Corporators—F. R. Hansel, Philadelphia; G. H. B. Martin and S. C. Seymour, both of Camden.

Chicago, Ill.—A. A. & M. B. Stevens Co., under Illinois laws; authorized capital, $5,000; to conduct a storage, livery and garage business. Corporators—John S. Chenneour, Avery A. Stevens, Edward J. Kelly.

Hartford, Conn.—John J. Roche Co., under Connecticut laws; authorized capital, $50,000; to operate a garage. Corporators—John J. Roche and Carroll F. Roche, of Hartford; Henry W. Nuckols, West Hartford.

Chicago, Ill.—Consumers' Service Co., under Illinois laws; authorized capital, $20,000; to conduct a general manufacturing, garage and livery business. Corporators—Frederick W. Snider, Ada S. Mitchell, Paul L. Menn.

Morristown, N. J.—Morristown Automobile School, under New Jersey laws; authorized capital, $125,000; to conduct a general automobile business. Corporators — J. O'Gorman, J. J. Lyons, T. E. Lowe, all of Morristown.

New York, N. Y.—Kerosene Carburetor Co., under New York laws; authorized capital, $100,000. Corporators—Louis F. Pelletier, 302 West 111th street; Ernest F. Ciglia and Hilding Anderson, both of 319 West 95th street.

Buffalo, N. Y.—Star Motor Delivery Co., under New York laws; authorized capital, $20,000; to conduct a general trucking and delivery business. Corporators—John B. Corporan, William H. Corcoran and Richard H. Conner, all of 199 Pearl street.

New York, N. Y.—Taxicab Association, under New York laws; authorized capital, $10,000; to conduct a taxicab business. Corporators—L. Horatio Biglow, Jr., 1267 Pacific street, Brooklyn; Alfred L. Loomis, Tuxedo Park; Aksel Wichfield, 16 West 55th street.

St. Louis, Mo.—Bond Automobile Co., under Missouri laws; authorized capital, $10,000; to engage in wholesale and retail buying and selling of motor cars and accessories and to conduct a general repair business. Corporators—Mark W. Bond, Caroline Bond, Charles Kist.

New York, N. Y.—Yorkville Auto Supply Co., under New York laws; authorized capital, $10,000; to manufacture and deal in rubber tires, rubber goods and automobile supplies. Corporators—Sydney Richman, 1235 Lexington avenue; William Yates and A. E. Stacy, both of 1236 Lexington avenue.

Weed Starts One Suit; Ends Another.

The Weed Chain Tire Grip Co. this week filed suit in the United States District Court for the Eastern District of Pennsylvania, sitting in Philadelphia, against George J. Campbell, for alleged infringement of the Parsons patent, No. 723,299, under which Weed chains are manufactured; Campbell manufactured on a small scale.

Shortly before the latter suit was filed, the Weed company secured a decree in its long-contested action in the Federal court in Trenton, N. J., against the Enterprise Chain Co. and William T. Morgan, which made the Morgan grip. The case was bitterly contested when it was filed several years ago, but the decree was taken with the consent of the defendants, who made a cash settlement in lieu of damages.

EXPORTS REGAIN STRENGTH IN AUGUST; INCREASE 42%

Gain in Number of Cars is 52 Per Cent. — United Kingdom a Leader — Engines and Tires Decline— Total Value $2,843,599.

Despite a tendency to sag during recent months, the exportation of cars from the United States to foreign countries during the month of August regained their former strength and advanced by 52 per cent. in number and 42 per cent. in value; another noteworthy detail of the record prepared by the Federal statisticians is that the United Kingdom, which decreased its purchases of American cars following the British cry of "American Invasion," is this time within one of being the leader in the gain in number of cars and value.

The United Kingdom's purchases were 348 greater in number and were larger by $274,008, which is an increase of 309 per cent. in number and 273 per cent. in value. This geographic division is surpassed only by Other Countries, in which the increase was 233 cars, or 466 per cent., and $194,211, or 480 per cent. The United Kingdom's advances, however, were larger numerically than any other.

Of Continental Europe, Germany increased its purchases of American cars while France, in number, and Italy entered the loss column by slight percentages. Other Europe, Canada and Mexico did not buy as much as in August, 1912, which is a not inconsequential backward move when it is considered that Canada formerly ranked among the leaders.

South America added 57 cars, or 32 per cent., and $112,919, or 65 per cent., to its record of a year ago; other increases were made by the West Indies and Bermuda, British Oceania, and Asia and Other Oceania. The gain in the total of cars was 683 and $588,150.

Of the increase of 683 in cars, 11 were trucks and the increase in value for these vehicles was $2,192, respective percentage advances of 19 and 2. The gain in pleasure vehicles was 672, or 53 per cent., and $585,958, or 45 per cent. Parts to the value of $454,881 were exported in August, 1913, which is an advance of $23,511, or 5 per cent. over the value of these products for the same preceding month.

Engines and tires failed to make advances. The location of numerous American branch factories in Canada doubtless accounts for the fact that engines are not exported as heavily as heretofore. In August last the number decreased by 527, or 63 per cent., while the value shrank by $53,474, or 65 per cent. The value of the tires exported was less by $28,750, or 6 per cent.

The varying gains and losses served to bring the gain in the total of all products to $529,437, less than the gain in the value of cars alone. This, however, is an advance of 23 per cent. Also, for eight months ending with August the total value increased over the same period of 1912 by $4,777,966, or 20 per cent.

While the exports are increasing in number and in total value the average value per car continues to keep pace with the general lessening in the price of automobiles. In August, 1912, the average value of the pleasure cars shipped abroad was $1,019, while in that month of 1913 the average value was $968, a decrease of $51, or 5 per cent. The average value of the trucks in August, 1912, was $1,881 and in August, 1913, $1,609, a decrease of $272, or 15 per cent. The figures in detail are shown by the subjoined table.

	August				Eight Months Ending August					
	1912		1913		1911		1912		1913

* Does not include engines and tires. † Not separately stated prior to July 1, 1913. ‡ Covers only last half of year.

AUGUST IMPORT STATISTICS INDICATE GENERAL DECLINE

Not One of Foreign Car Manufacturing Countries Makes Gain Over Preceding August — Decrease of 60% in Valuation.

The record of the importation of foreign cars into the United States during the month of August just passed probably differs from the record of any preceding month—any recent month, at least—in that none of the geographic divisions or countries from which the cars are shipped gained over the same month of the preceding year. There are five divisions, according to the Federal statisticians, and every one of them lost. Germany shipped three cars in each month but it lost in value.

The losses in number were: France, 23.70 per cent.; United Kingdom, 9, 69 per cent.; Italy, 1, 20 per cent.; Other Countries, 2, 17 per cent. In value the shrinkage was: France, $60,431, 73 per cent.; United Kingdom, $22,540, 71 per cent.; Germany, $2,492, 44 per cent.; Italy, $2,776, 25 per cent.; Other Countries, $5,789, 24 per cent. Parts decreased by $15,656, or 46 per cent. The total of cars decreased by $35, or 53 per cent., and by $94,028, or 60 per cent. For eight months ending with August the loss was 182 cars, or 34 per cent., and $407,808, or 33 per cent. The figures follow:

	August			
	1912		1913	
	No.	Values.	No.	Values.
France	33	$82,639	10	$22,208
Germany	3	5,705	3	3,213

In the RETAIL WORLD

Thomas Savage, of Parkersburg, W. Va., plans to open a garage.

Frank M. Nutter has entered the trade in Atlantic, Ia. He is marketing a tire filler.

Henry Cartier and Frank Lewis are erecting a garage and machine shop in Freeland, Mich.

E. W. Fawley and J. D. Langdon, of Waterville, Wash., have entered the trade; they have the Hupmobile agency.

The Meeley Rubber Co., of Philadelphia, Pa., has completed a tire repair plant; it is located at 660 North Broad street.

James P. O'Gorman, of Morristown, N. J., is about to erect a garage; he plans to build it at South and Boyken streets.

H. D. LeCate, of Camden, N. J., is about to erect a garage; he has secured a site at King's highway and White Horse pike.

Mortimer Evans, of Elwood City, Pa., plans to erect a garage on 5th street; it will represent an expenditure of $4,000.

A three-story garage is to be erected in Glens Falls, N. Y., for the Adirondack Motor Car Co.; the site is on Main street.

L. C. Houck, of San Antonio, Tex., is about to open a garage; he is remodeling the Star Theater building for that purpose.

The Clayton (N. Y.) Motor Supply Corporation is erecting a new building; it will be ready for occupancy about October 20.

W. J. Crowell, J. A. Rose and C. H. Garman, of Charlotte, N. C., have established an agency; they represent the Haynes line.

The Burton-Rounsaville Tire Co., of Los Angeles, has dissolved; R. W. Burton has turned his interest over to L. S. Rounsaville.

The Andrews-Dykeman Co., of Boston, has opened a new sales and service station; the building is located at 43 Warren avenue.

The Tibbals-Gavin Co., of San Diego, Cal., has changed its name to Gavin-Williams Co. It is an accessory and supply dealer.

James Hillard, of Philadelphia, Pa., has awarded the contract for a new two-story garage, to cost $4,700; it will stand at 1710 Venango street.

W. O. Taylor, of Toledo, Ohio, has purchased the holdings of R. R. Browne in the Erie Supply Co. This gives Taylor a controlling interest.

The Poughkeepsie (N. Y.) Utilities Co. has taken possession of new quarters on Mechanics' court; the company handles supplies and accessories.

Gerdes & Elken have taken over the Humboldt Auto Co. and the Lynch Auto Co., both of Humboldt, Neb. Each operated a garage and agency.

J. E. Smith, formerly a liveryman in Houston, Tex., has been granted permission to operate a garage; the location is at Henderson and 6th streets.

E. H. Carpenter, formerly general manager of the Sacramento (Cal.) Star, has entered the automobile trade; he has opened a supply store at 1123 J street.

W. C. J. Warner, formerly a Goodyear tire man, and James MacSwain, formerly connected with the Batavia line, have opened a tire agency in Boston, at 68 Huntington avenue; they have the Quaker representation.

The Gorges & Blieck Automobile Co., of East College avenue, Appleton, Wis., has been dissolved; Blieck has retired from the business, which will be continued by A. H. Gorges. The firm handles Cadillacs and operates a garage.

The W. W. Wertz Auto Co., of Lincoln, Neb., has bought out the Lincoln Auto Co., one of the oldest trade concerns in that city and whose members are retiring from business; the price is $30,000. The Wertz company stocks Studebakers.

Arthur Hertz, who recently secured the Hupmobile agency in Seattle, and William T. Patten, who has handled Whites for some time, have combined their interests under the style William T. Patten Motor Car Co. They are temporarily located at 525 Olive street.

W. H. McIntyre, formerly of the Landman-Griffith-McIntyre Co. in Toledo, Ohio, has formed the W. H. McIntyre Co. and has opened salesrooms at 307-11 10th street, Toledo; he has the Detroiter distribution for 20 counties of Northwestern Ohio and a part of Southern Michigan.

The Perrett-Barber Motor Sales Co. has taken over the Barber Motor Sales Co., which previously handled Detroiter cars in Michigan; the company has 50 subdealers and its officers are: President, William M. Perrett; vice-president and treasurer, Zach Barber; secretary, H. J. Latour. Perrett, who thus enters the car business, previously was one of the landmarks of the tire trade.

John F. McLain, who has been manager on the Pacific Coast for the Franklin Automobile Co. since 1909, and who also combined with that position the management of the company's San Francisco branch, has taken over the branch as a dealer; he will operate as the John F. McLain Co.

Townsend & Hine, of Evansville, Wis., has been dissolved; Bruce Townsend has disposed of his interest to J. H. Hyne and his son, who will operate as Hyne & Son. Townsend will engage in the garage business in Madison, Wis., locating in the Lemmel building. He also will open salesrooms.

The A. P. Mitchell Auto Co., of 701 Commerce street, Fort Worth, Tex., has been reorganized with A. P. Mitchell as president, Earle M. North vice-president and E. L. Malone secretary-treasurer; it will be capitalized at $15,000. The company, which entered the trade four years ago, will continue to handle Studebaker and Cadillac cars.

L. A. McKay, formerly district manager for the Franklin Automobile Co. in nine States and Manitoba and Saskatchewan, has become the Franklin dealer in Minneapolis; prior to his district managership he handled sales west of the Mississippi and was stationed at the factory in Syracuse. McKay is a native of Nebraska and graduated into automobiles from bicycles.

The Reeke-Osmond Motor Car Co. of Milwaukee has been organized in that Wisconsin city by Alfred Reeke and Norman E. Osmond, respectively manager and sales manager of the Milwaukee branch of the Thomas B. Jeffery Co., of Kenosha, Wis. The company is capitalized at $50,000 and, it is said, plans to take over the Rambler branch, located at Broadway and Milwaukee street.

The Northwest Haynes Auto Co. has been formed in Minneapolis and will handle the Haynes business in that territory, with headquarters at 1012-14 Hennepin avenue; it is capitalized at $50,000. The officers are: President, A. C. Porter; vice-president, Jos. William Gray; secretary and treasurer, John N. Knutson. Porter and Knutson have been connected with the trade in that territory for some time.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

E. H. Chase, Jr., has been appointed sales manager of the Lyons-Atlas Co., of Indianapolis. Previously he was sales manager of the Olds Motor Works branch in Louisville, Ky.

E. G. Soward, previously connected with the Thomas B. Jeffery Co., has been appointed manager of the new business department created by the Velie Motor Vehicle Co., of Moline, Ill.

George H. Matheson has been appointed purchasing agent of the Keeton Motor Co., of Detroit. Until its failure, Matheson was identified with the Wilkes-Barre (Pa.) company which bore his family name.

Melville A. Pollock has joined the advertising department of the Locomobile Co. of America, of Bridgeport, Conn. Previously he was advertising manager of the Taylor Instrument Co., of Rochester, N. Y.

Henry Tuttle, formerly identified with the Stoddard-Dayton and Howard Motor Car companies, has joined the sales staff of the Lyons-Atlas Co., of Indianapolis. He is now covering New England, placing agencies for the Lyons-Knight tire.

After eight years' service, during three of which he served as assistant sales manager, George H. Cox has retired from the Thomas B. Jeffery Co.'s service. He has no plans for the immediate future, but intimates that he may enter the jobbing trade.

E. M. Lamb, former manager of the service department of the Gramm Motor Truck Co., of Lima, Ohio, has been transferred to the service department of the Gramm Canadian company. He, of course, will remove to Walkerville, Ont., where the Canadian factory is located.

Having disposed of its Chicago retail branch to Lafayette Markle, who previously also managed the wholesale department, the Studebaker Corporation has appointed B. T. Kinsman manager of the latter. Formerly he was in charge of the Studebaker branch in Buffalo. The vacancy in the latter city has been filled by the appointment of Joseph O. Hahn.

After a brief absence, Fred E. Dayton, former sales manager of the United States Motor Co.'s Columbia department, has returned to the automobile industry. This time, however, he has gone into tires instead of cars, having been appointed assistant to J. C. Matlack, sales manager of the Ajax-Grieb Rubber Co. In connection with his other duties, he will handle Ajax advertising.

N. E. Wahlberg has been promoted to the post of chief engineer of the Oakland Motor Car Co., of Pontiac, Mich. He has been the company's assistant engineer for some two years and before entering its service had been connected with the engineering departments of the Packard and Thomas establishments. He succeeds F. H. Berger, who is preparing to go to Europe for a stay of several months.

Henry W. Nuckols, for many years identified with the Columbia car and president of the Columbia Motor Car Co., of Hartford, Conn., at the time its owner, the United States Motor Co., went into bankruptcy, has been appointed assistant to M. J. Budlong, president of the Packard Motor Car companies of New York, Philadelphia and Chicago. Budlong and Nuckols are old acquaintances and, naturally, were in close company when Budlong himself was the head of the Columbia company, long before it was taken into the United States Motor fold.

Minor Business Troubles.

Morris H. Wilcher, a dealer in Rock Island, Ill., has filed a petition in bankruptcy; he states that his assets are $2,449.60 and his liabilities $4,629.34. The greater portion of his assets are accounts.

The Milwaukee (Wis.) Oil Pump & Tank Co. has filed a petition in bankruptcy; its assets are $7,717.31 and its liabilities $8,026.23. The company manufactured oil and gasolene tanks with automatic pumps for garages and operated a factory at 259 Clinton street. Arthur E. Riess is president.

Adam H. P. Sechrist, of York, Pa., has been adjudicated a bankrupt in the Federal court in Scranton; he operated at 243 South George street, York, as the Pennsylvania Auto Co.

As a preliminary to the winding up of the affairs of the Oldsmobile Co., of Cleveland, Ohio, a receiver was appointed last week upon application of J. J. Schmitt, a stockholder, who claims the company's liabilities are $3,000 and that all its assets will not net more than $4,000. The company, which is not connected with the Olds Motor Works, of Lansing, Mich., the maker of Oldsmobiles, is capitalized at $50,000.

Orville E. Short, of 250 West 54th street, New York City, a dealer in carriages and automobiles, has filed a petition in bankruptcy, citing as a reason his connection with the Michigan Motor Car Co., which is in bankruptcy and with which he had a running account for the last five years; he states that his liabilities are $65,280 and his assets $25,039, consisting of stock, $175, and accounts, $24,865. The Michigan company is put in the schedules as a creditor for $26,704 and there also appears an item of $31,857 in notes given by Short and discounted by the Michigan concern, the present holders of which are not known. This company also appears as debtor to Short to the extent of $17,000. Short had been in business 21 years, is interested in several companies and was president of the Auto Body & Taxicab Co.

Recent Losses by Fire.

Marshalltown, Ia.—R. B. Herr; garage destroyed. Loss not stated.

Dallas, Wis.—D. A. Russell; garage and warehouse destroyed. Loss, $5,000.

Palo Alto, Cal.—G. Bracchi; garage and one car destroyed. Loss not stated.

Dallas, Tex.—Buick Auto Co., Pearl and Commerce streets; garage damaged. Loss, $1,000.

Rockport, Mass.—Cape Ann Tool Co., manufacturer of automobile supplies; plant destroyed. Loss, $30,000.

Detroit, Mich.—Detroit Auto Specialty Co., 911 Greenwood avenue; enameling plant destroyed. Loss, $8,000.

Mosler-Lurie Plug Appeal Argued.

The Canfield spark plug patent, No. 612,701, granted October 18, 1898, and held by A. R. Mosler & Co., made another fight for life this week in the United States Circuit Court of Appeals in New York City, when the appeal was argued in an action brought by Mosler against John Lurie, trading as the Automobile Supply Co. in New York City. The action was decided adversely to Mosler last October in the lower court, whereupon this company carried it higher in an effort for a final adjudicatiton. The patent is claimed to cover all plugs having deep recesses around the electrodes. The burden of the defense is generally understood to be borne by the Rajah Auto Supply Co. and C. A. Mezger & Co.

Eleven More Added to M. A. M. Roll.

Eleven more applicants have been elected to membership in the Motor and Accessory Manufacturers, Inc., as follows: Cleveland Tanning Co., Cleveland, O.; Racine Mfg. Co., Racine, Wis.; Benford Mfg. Co., Mt. Vernon, N. Y.; Gemmer-Detroit Starter Co., Detroit, Mich.; McGraw Tire & Rubber Co., East Palestine, O.; J-M Shock Absorber Co., Philadelphia, Pa.; F. S. Carr Co., Boston, Mass.; Torbensen Gear & Axle Co., Newark, N. J.; Taylor Instrument Co., Rochester, N. Y.; Reynolds-Browne Co., Chicago, Ill.; Knight Tire & Rubber Co., Canton, O. These additions bring the total membership of the organization up to 258.

OVERLOADING AND TIRE LIFE.

With wise minds already bent—or soon about to be bent—upon a solution of the problem of tire wear with heavy commercial vehicles, it would seem that there is at least one phase of the question to which little if any attention has been paid. Except the purveyors of coal, and possibly a few other commodities that are sold, or transported by weight and not by bulk, there are very few owners or operators of motor trucks who know with a sufficient degree of accuracy to be valuable the exact load weight.

It is a fact that much of the instruction offered by commercial makers and the makers of tires hinges about the admonitions not to overload and not to overspeed, and while it is comparatively easy to insure positively against overspeeding it is by no means as simple to prevent overloading, though one evil is, manifestly, as great as the other. Placing credit where credit is due, they arrange these things better on the other shore of the Atlantic than they do in America. In England, for instance, not only is the legal rate of speed prescribed—and a great deal more rigidly enforced than is the case in America—but the weight supported by each axle of a loaded vehicle must be registered with the authorities and marked on the body in plain figures, and due to a healthy regard for the activity of the police in unexpectedly checking axle weights mitigates very effectually against the overloading evil.

It is these stringent police regulations of heavy motor traffic and their rigid enforcement that have been responsible for the development of a number of foreign devices which are in effect combination lifting jacks and weigh scales, and they are understood to be in very considerable use. Thus, the police department, in protecting itself, has forced the users of commercial vehicles to protect themselves by making certain that their vehicles are not overloaded.

But the method of the coal dealer is much simpler than is police regulation. Nine-tenths of the users of motor trucks never go to the trouble of weighing their loads and until they do so no amount of careful driving can be expected to increase tire life by any appreciable amount.

SPEEDING THE AGRICULTURAL TRACTOR.

The light agricultural motor tractor, capable of doing the work of one or two horses, and for which an enormous future seems probable, is making gradual progress. Manufacturers, both great and small, are seeking to perfect it; companies are being formed almost weekly, but much remains to be done, not only mechanically, but in the way of convincing demonstration. For the introduction of motor plows and the like is not altogether easy. Farmers, as a rule, are not fools, caricaturists to the contrary notwithstanding, but are conservative in matters pertaining to their own business. The farmer wants to be shown, and shown conclusively.

Just what constitutes a farmer's idea of being shown is plainly indicated by the remarks of one of a number of New York State farmers who have discussed rather thoroughly the practical aspects of agricultural motor service.

"Manufacturers of motor plows have tested their machines," he said, "and according to their own reports the tests have been very satisfactory. No doubt they were satisfactory, for the operators were thoroughly familiar with the machines and knew what to expect from them under given conditions, and what to do in all cases. But a small farmer who has to look at least twice at his money before spending it must know what a machine will do in unfamiliar hands and, further, what it will do day after day in actual farm service. Short tests, however strenuous, in expert hands will not convince many farmers. And it must be shown that the tractor is sufficiently economical not only to make its cost worth while, but also to compensate for the fact that it cannot displace in practice as many horses as in theory, for horses must be maintained for road work.

"The manufacturer should place machines in the district in which it is desired to make sales, putting them to work in the hands of average farmers and leaving them for a month or six weeks. The operation should be in the hands of farmers, the experts within reach but keeping their hands off."

Such tests would arouse genuine interest, and a successful outcome would mean business, for farmers who could not be convinced by the strongest printed arguments and reports would be bound to credit their own observations, and self-interest could be depended upon to do the rest.

KLAXON CONTEST A COURSE IN HORNOLOGY FOR PUBLIC

Will Award Prizes for Best Regulation for Warning Devices—Limits Competition to Bay State and Caters to Schools and Granges.

It is not improbable that by November 20 the population of Massachusetts will know considerably more than it does now about automobile warning signals and their regulation and, incidentally, about the Lovell-McConnell Mfg. Co., of Newark, N. J., the maker of Klaxon horns. This result, the Klaxon company hopes, will be accomplished through a contest it is promoting in the Bay State, the announcements having been sent for distribution in public schools, Granges and all general court offices.

The contest offers $250 for "the best seven suggestions as to how to regulate the use of warning signals on automobiles, divided as follows: First, $150; second, $50; next five, $10 each. A four-page folder which carries the announcement enters into a discussion of the necessity of adequate warning signals, tells of their use and misuse, their functions and the regulations which have been adopted in various States and cities. Chicago's solution of the problem is regarded as the best thus far, it calling for "an abrupt note sufficiently loud to serve as an adequate warning," but to be used only as a warning signal. The warning signal has come in for attention in numerous municipalities and the remedial measures that have been devised vary. Some, which were short-lived, prohibited some of the better known mechanical types and, on the whole, the question has been a poser.

Suggestions are to be addressed to the Warning Signal Committee, drawer 2302, Boston Post Office, and must be mailed prior to November 20. In case of a tie priority of postmark will determine the standing. The awards will be announced between December 1 and 10. Each competitor must be a resident of the State of Massachusetts, must not exceed 400 words and must write on one side of the paper only.

The educational character of the contest is indicated by the personnel of the committee of judges, which comprises: William L. Douglas, Brockton, former governor of Massachusetts; James A. Gallivan, chairman of the Board of Street Commissioners of Boston; George S. Ladd, Sturbridge, a member of the executive committee of the Massachusetts State Grange and of the Bureau of Highways of the United States Department of Agriculture; Daniel F. Gay, Worcester, a director of the Automobile Legal Association, former president of the Worcester Automobile Club, and a director of the American Automobile Association.

S. A. E. Schedules its Winter Meeting.

The dates for the annual winter meeting of the Society of Automobile Engineers were definitely decided at the meeting of the Council which was held last week at the headquarters of the society in New York City. Following a new plan that is expected to relieve somewhat the monotony of continuous business sessions, it is planned to leave a whole day free between the two principal sessions. A social gathering to inaugurate the meeting will be held at the Manhattan Automobile Club on Sunday afternoon, January 4th; no business will be transacted. The following Monday morning will be devoted to a meeting of the Standards Committee in the S. A. E. headquarters and the business meeting proper will not be taken up until Tuesday morning, January 6th, at Grand Central Palace; three sessions will be held during the day—morning, afternoon and evening—and the same program will be carried out on Thursday, January 8th, leaving Wednesday, the 7th, free. As usual, the meeting will be drawn to a close with a banquet on Thursday night, though it has not been decided where the "spread" will be served.

"Move-on" Ordinance Stirs Milwaukee.

To protest against three ordinances which become effective October 27th, most obnoxious of which is one which would prohibit the owners of cars letting them stand longer than is necessary to receive or discharge passengers between the hours of six in the morning and seven in the evening in a zone virtually in the heart of the business section of the city, the Milwaukee (Wis.) Automobile Club has called a mass meeting for Thursday evening next, when a fight against the measures on the ground of unconstitutionality will be outlined. The second ordinance prohibits any one letting cars stand on any street for more than 45 minutes, and it therefore is considered ambiguous. It has a redeeming clause, however, which prohibits pedestrians taking "Dutch cuts" across the streets under penalty of fines ranging from $5 to $50. The third ordinance makes the emission of smoke and odors a punishable offense.

Y. M. C. A. Takes Over Engineers' School.

The New York School of Automobile Engineers has been taken over by the Automobile School of the West Side Y. M. C. A., which also has conducted a course in automobile instruction; both students and equipment have been moved to the Y. M. C. A. headquarters at 8th avenue and West 57th street. The school was opened in 1905.

*Indicates Sanction by A. A. A.

Oct. 15-25, New York City—Annual electrical exposition and electric vehicle show in Grand Central Palace.

Oct. 17-18, Chicago, Ill.—Chicago Motor Club's annual amateur vs. Trade reliability tour.

Oct. 17-27, Paris, France—Annual automobile salon.

Oct. 18-19, St. Louis, Mo.—Track racemeet under auspices of J. A. Sloan.

Oct. 18-Nov. 2, Dallas, Tex.—Dallas Automobile Dealers' Association's automobile show.

Oct. 27-28, Chicago, Ill.—Annual Convention of the Electric Vehicle Association of America in Hotel La Salle.

Nov. 3, Los Angeles, Cal.—Los Angeles to San Diego to Phoenix road race.*

Nov. 4, El Paso, Tex.—El Paso Automobile Club's road race between El Paso and Phoenix, Ariz.*

Nov. 6, Phoenix, Ariz.—Track racemeet under auspices of Maricopa Automobile Club.*

Nov. 7-15, London, England — Annual British Automobile show.

Nov. 9-12, Shrevepeort, La.—Track racemeet under auspices of J. A. Sloan.

Nov. 12, 13, 14, New York, N. Y.—Motor Dealers' Contest Association's reliability contest.

Dec. 1-2-3, Richmond, Va.—Annual meeting of the American Automobile Association.

Jan. 2-10, New York City—Importers' annual automobile Salon in Hotel Astor.

Jan. 3-10, New York City—Automobile Chamber of Commerce's national automobile show in Grand Central Palace.

Jan. 4-5-6-8, New York City—Annual winter meeting of the Society of Automobile Engineers.

Jan 24-31, Chicago, Ill.—Automobile Chamber of Commerce's national automobile show in the Coliseum and First Regiment Armory.

Jan. 24-31, Rochester, N. Y.—Rochester Automobile Dealers' Association's annual show in Exposition Park.

Jan. 31-Feb. 7, Minneapolis, Minn.—Minneapolis Automobile Trade Association's seventh annual show in National Guard armory.

Feb. 2-7, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's pleasure vehicle show.

TURNER TOPS MOUNT FALCON IN RECORD BREAKING TIME

At Wheel of Maxwell He Cuts Existing Time for Rough Flight Virtually in Half, in Spite of Near-Accident—The Results.

Whirling up the rough sides of Mount Falcon, which is not very far from the city of Denver, in Colorado, W. H. Turner, at the wheel of a Maxwell, very easily won first place in the hill climb promoted by the Denver Motor Club on Saturday, 11th inst. Not only did Turner finish first, climbing the 3½-mile 20 per cent. grade in 11:32⅖, but he, and every one of the other six contestants, totally eclipsed the best previous record for the climb, which was made last year and which stood at 22 minutes flat. William Thorney, in a Chevrolet, was second, his time being 14:33⅖, and Bert Clark, at the wheel of a diminutive Ford, was third in 14:46⅖.

Although Turner won first prize easily enough, as far as his time for the flight was concerned, he did not have such an easy time making the ascent and once he came very near to losing not only the prize but his car and his life, too. In attempting a sharp right-hand turn, situated about half way up the grade, at too high speed, Turner skidded badly and for an instant one rear wheel hung over 1,500 feet of perfectly good mountain air; the momentum of the car was sufficient to carry it back onto the road, however, and no damage was done ,except to Turner's nerves.

The contest is an annual one and, as such, always serves to draw out a good crowd of spectators, the majority of whom congregated on the broad verandas of the club house which is at the starting line of the climb. This year, Governor Ammons himself, together with Mrs. Ammons and their daughter, were the guests of honor, the Governor acting in the capacity of honorary referee. The names of all the contestants, with their times and the order of finish, is as follows:

Driver and Car.	Time.
W. H. Turner, Maxwell	11:32⅖
William Thorney, Chevrolet	14:33⅖
Bert Clark, Ford	14:46⅖
Frank Nelson, Metz	15:02⅕
E. H. Ball, Franklin	17:31⅕
Frank Greenlee, Hupmobile	17:42⅘
J. A. Landing, Case	17:45⅖

Vincennes Meet Breeds Bad Accident.

In a racemeet that was held on the track at the Vincennes (Ind.) fair grounds on October 8th, Hugh Lewis, a local pilot who is reputed to be wealthy, was probably fatally hurt in a preliminary try-out when his car got beyond his control and crashed through the fence after proceeding sidewise for 25 or 30 feet. Jack Lanahan, who was on the track at the time and was going at good speed, collided with the wrecked car but escaped unhurt. Lewis sustained three fractured ribs and internal injuries, from which he is not expected to recover.

Springfield Fence Side-Swiped by Endicott.

William Endicott, more familiarly known by those who attend State fair automobile recemeets as "Wild Bill," furnished most of the thrills that were not furnished by Disbrow at a racemeet in Springfield, Ill., on Saturday, 11th inst. Endicott's thrill, or rather thrills, for they lasted some time after the accident, resulted from an encounter with the fence in which the fence came out a little the worse for wear, as did the Case car Endicott was driving at the time. Endicott, however, escaped with bruises, and the event, which was a five-mile exhibition race, went to Delloyd Thompson, a local pilot. Disbrow's thrills were given in the usual way. Which is to say, he drove his Simplex against time for a mile and was clocked in 50 seconds flat, and later whirled two laps of the track in the same car in 1:40⅕.

Guest in Car Rides at His Own Risk.

Again it has been decided that the man who accepts an invitation to ride in the car of another does so at his own risk and cannot collect damages in case he is injured in an accident to the automobile—this time the decision was rendered by the Supreme Court of Wisconsin in the case of M. J. Hannon, of Green Bay, against the Van Dycke Co., a real estate company in the same city. Hannon was awarded damages by the lower court and the Supreme Court reversed the decision.

The Van Dycke Co. hired a car to take Hannon into the country to see a farm it was offering for sale, and on the journey homeward the car met with an accident in which Hannon was thrown from the car, breaking both his legs. He asked damages of $2,500.

One Elgin Race Damage Suit Dropped.

Because Dr. Francis W. McNamara, of Chicago, was tardy in the prosecution of a $25.000 damage suit he had brought in Elgin, Ill., against the Elgin Road Race Association, Philip Freiler, Allen Retan, W. J. Gilbert and W. H. Goetting, members of the association, for injuries sustained when the grandstand collapsed during the 1911 races, the action was dropped fromthe calendar last week. A suit on behalf of Dr. McNamara is on file in Chicago against the Elgin Road Race Association, the Chicago Motor Club and Contractor McHugh, who built the stand.

MOTOR CLUB IS VICTORIOUS FIRST TIME IN SIX YEARS

Chicago Motorists Defeat Their Athletic Club Rivals by Sixteen Points in Tour that Proves Mudlark —Gain Both Trophies.

For the first time in six years, the Chicago Motor Club triumphed over the Chicago Athletic Club in the annual inter-club reliability run that each year brings teams from each organization to fight for the Allan S. Ray and Carlton White trophies. The run, which was held on Friday last, 10th inst., led the two teams of 11 cars each to Hudson Lake, Ind., and return, and outside of the fact that it was won by the C. M. C. members, was distinctive by reason of the appalling amount of mud the cars plowed through and carried back to the Windy City.

On the outward bound trip, fair weather smiled on the tourists and no black marks were doled out. But soon after the return journey was started the "rain came down in slanting lines" and turned the country roads into morasses, cut up with crevasses, and made them nearly as slippery as the fabled glass mountain. On the C. M. C. team, R. L. Parker drew nine of the 10 points demerits for failing to let his engine run while changing a tire, and A. M. Robbins drew the other one for being one minute late at control. On the C. A. C. team, W. B. Simpson took on water out of control, which cost him six points; F. E. Mann lost himself on the roads and drew 19 points, and L. Jacques drew the remaining one point for letting his motor "die" at a railroad crossing.

The complete score is as follows:

Chicago Motor Club.

Driver and Car.	Penalty.
J. E. Callender, Edwards-Knight	0
G. F. Ballou, Apperson	0
C. G. Sinsabaugh, Chalmers	0
W. D. Morris, Winton	0

ORGANIZATION OF ONESELF

What Is Good for the Factory or Sales Force Is Good for the Individual—Big Corporation Advises Its Salesmen to Give Selves Orders.

"Ad" West is a "York State" builder and contractor who is accredited with a capability for doing good and thorough work; one of the characteristics which is at the root of his mechanical success is a belief in organization. If he starts on a job he believes in getting his tools on hand and his work arranged, whereupon he proceeds to the task and does it in the shortest possible time.

One day he was eating his lunch from his tin dinner pail in the attic of a partially completed building, but he didn't seem to be getting along just right. Finally he exclaimed, "Hell! No wonder! I ain't organized." With that he set one saw horse next to the wall, set another a few feet in front of the first, laid a plank across the two, set the dinner pail between his legs, leaned against the wall and finished his dinner in comfort. Even in this semi-pleasure he had to be organized.

"No Verbal Orders" Good for the Man.

Organization of one's self in much the same manner often is effective when the organizer, upon a little self-inspection, finds that he is not working up to his possible efficiency. To its salesmen the National Cash Register Co. recommends self-given orders and self-organization and suggests the writing down of things to do and not to do.

"What did I do yesterday which I ought not to have done, and what ought I to have done yesterday that I did not do, and what shall I do today?" it says.

"In order to get the best results I must put down in writing things I plan to do or else I will forget them. Now, at the factory they used to forget many things, and so they issued an order, 'Verbal Orders Don't Go!' If it was a good thing for the factory to issue to all of its people an order that 'Verbal Orders Don't Go,' then it is a good thing for me to issue written instructions to myself—for what was a good thing for a great many people is a good thing for the individual. So I will put down on one side the things I must eliminate from my daily routine, and on the other side the most important things I must do, because the first thing for me to do is to organize my own self, and I have never done that. I have never formed rules for the government of myself, rules which will get the greatest results with the least effort.

"There is no reason why I can't double my results in the same time, and be happier and better, if I only organize myself."

TURNING TESTIMONIAL LETTERS TO THE GREATEST ADVANTAGE

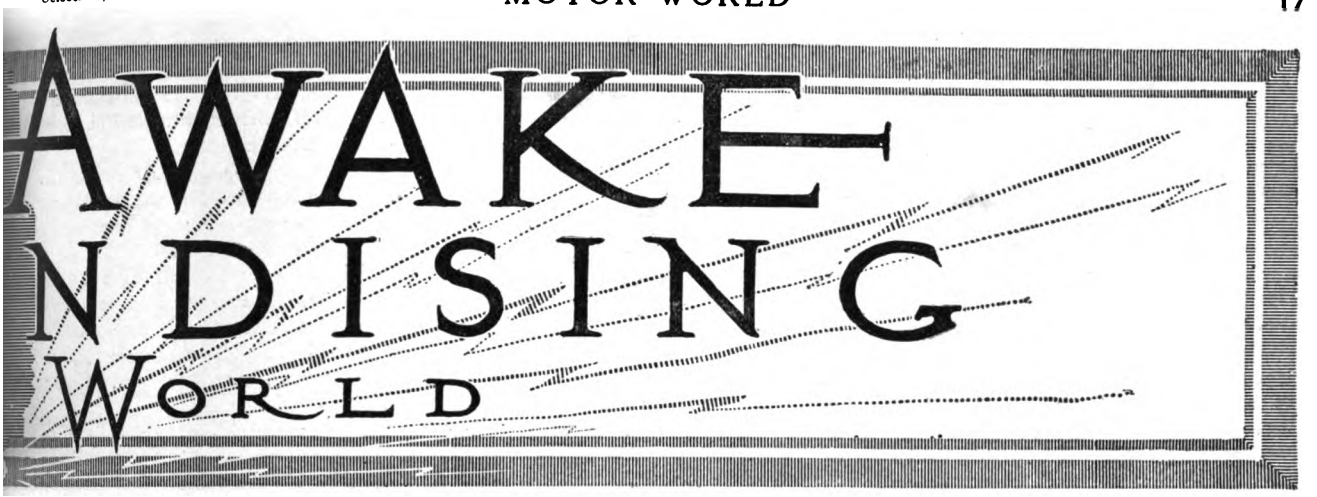
Did you ever try the helpful effect of a few red-hot testimonial letters from persons who have bought cars from you? Some of the letters are sure to boost the car, others are just as likely to touch on the efficient service that is back of it, and perhaps say a few words about the pleasure of dealing with such a live concern.

Securing Testimonials Not Difficult.

If you are doing business on the level and marketing the right sort of car, it is not hard to secure the kind of testimonial letters that count—and count big. Pick out a few "sizzlers" from those you get, and mount them in neat black frames the exact size to accommodate a regular size letter sheet (8½ x 11 inches) and hang them on the walls of your salesroom. You will be surprised and pleased at the result.

There is something magnetic about a letterhead and a signature. Hang it where it can be seen and it draws people towards it. They just naturally want to see what it says. Try the plan and see how it works. The Bemb-Robinson Co., Detroit, agents for Hudson cars, have four or five framed testimonial letters in their salesroom and their experience is that it pays.

WHY THE SALESMAN WISHES HIS HOUSE WOULD ADVERTISE



"No, sir! I never allow my customers to overstock on my goods, and I never let them buy anything I think they cannot sell," declared a successful jobber's salesman. "The result is my customers regard me as a friend and I rarely call on one without getting an order. My house is one of the originals in the business and thinks it is too well known to need advertising or to try to build up trade along modern methods, so it is up to the salesman to do everything that will make himself solid with the customers.

May Be Forgotten Without Advertising.

"Competition? Yes, there is quite a bit of it; 27 men on the road in this territory calling on the same dealers make things pretty lively, but our house has a reputation for dealing squarely with its customers that is worth a lot of money. But, I do wish they would advertise; if the 'old man' would go on the road again for even one month he would realize what a great boost it would give every man working for him. I like my concern, but I cannot help feeling that they are missing a great deal by sticking so closely to those old-fashioned policies.

"The 'old man' is not stingy; he simply thinks that everybody knows us because we are one of the 'originals'; he forgets that the trade is constantly changing and that the new ones never heard of us. I certainly would like very much to see him loosen up a little."

"KICKER" SELDOM A WORKER

Dealer Who Is Trouble to Factory Does Not Rank With "Live Ones"—Large Retailer Points Out One of Dealers' Greatest Failings.

"The main thing in closing a contract with a dealer is to know how much weight he carries in his community; most troubles are not with the line but with the dealer." So says a big dealer who has been selling cars for a long time and who handles a number of sub-dealers.

"The dealer who is always kicking is the dealer who does very little real work," he adds. "He has been sitting back waiting for someone to make a sale in his territory —and someone is sure to make it—if he doesn't; when this happens he gets into action for a share of the commission. Half the kicks that come into this office come from just that sort of dealers. Fortunately the number, as far as we are concerned, is being lessened all the time, because we do not want that kind of dealers.

"Live" Dealer Generally Helps Self.

"Factories spend an awful lot of time and money 'protecting' dealers and keeping them in business when they are 'dead ones.' The amount of money wasted this way is stupendous. The only fellow you have to send your road man out to help is a 'dead one'; you never have to spend time and money helping the live one; he helps himself, and that's why he is alive.

"The 'dead' dealer is always in trouble; his competitors are cutting prices or doing something else that stops him from getting business; he has a million excuses for not making good. Like the poor salesman, he can think of a thousand reasons why he did not make the sale. If he would only spend his time thinking of one good reason why he should make it and then go after it, there would be some purpose in his thoughts.

"Every salesman and dealer who has covered any territory to speak of knows that to line up the best dealer—the real worker —the live, wideawake, red-blooded, vigorous business-getter means more for success than anything else."

MAKING THE PROSPECT ARGUE FOR YOUR SIDE OF THE CASE

Making a prospect convince himself that you are right is not an impossible task. The working of the mind of the "other man" is peculiar and an understanding of it is invaluable to the man who sells. The late Mayor Gaynor of New York City was considerable of a philosopher, and in a letter answering a rabid reformer the mayor well explained the wisdom of lack of superlative.

"Did you ever read that part of Benjamin Franklin's autobiography in which he says that the way to convince another is to state your case moderately and accurately," he wrote, "and then scratch your head or shake it a little and say that that is the way it seems to you, but that, of course, you may be mistaken about it; which causes your listener to receive what you say, and, as like as not, turn about and try to convince you of it, since you are in doubt; but if you go at him with a tone of positiveness and arrogance you only make an opponent of him."

EMPTY GASOLENE TANK THAT NEARLY LOST SALE OF A CAR

Keeping the gasolene tank of the demonstrating car filled is an essential that it is well never to neglect. Absentmindedness in this respect nearly lost a sale a few days ago for a dealer in Houston, Tex. He was demonstrating his car to a woman and her husband; the husband was a spectator, as the wife was the one to pass on the car. Before taking the car out, the salesman gauged his gas and found less than a gallon in the reservoir. But, determined to get his prospects in the car, he started for them, intending to pick up the couple, then go to a station and refill his tank.

He got his prospects in the car, but became so busy explaining the good points of the car and beauty of its lines he forgot all about loading up on gas. Away they went toward the country, out Main Street road; he put on more speed to show off "the little beauty."

Then the fatal gasp just before the wake is held over a dead engine.

Difficult to Overcome Bad Impression.

"I forgot to fill the tank," he declared in amazement. "But we will get back all right, so here goes for me calling the service car."

While the busy dealer was at the telephone the wife turned to her husband on the back seat:

"I don't think much of a car that won't go 10 miles. Just as soon as we get back to Houston let's go buy that other machine we saw."

She was determined, but the husband "tipped off" the dealer, and the rest of the day was spent in showing the wife that the car would make all sorts of miles if one only remembers to fill the tank.

"Society" Opening That Was Successful.

The Dominion Motor Car Co., which handles Hudson cars in Victoria, B. C., recently had an opening of its new garage. The premises were magnificently decorated with palms, ferns and cut flowers; an orchestra was stationed on the mezzanine floor. The opening was a big success. It brought out the society people and it stamped the line this concern handles as a fashionable one. Such a plan is not difficult to follow and it brings results. See if you cannot do something that will make people realize that you are there, when your new models arrive. It is your chance to rivet attention. Do not miss it.

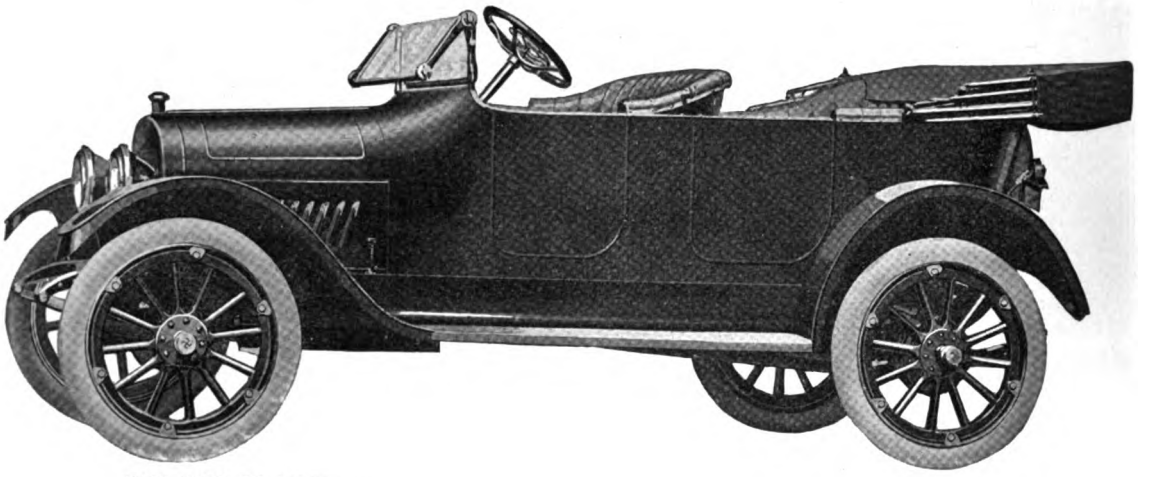
KRIT CAR CHARACTERISTICS PLAIN IN LATEST MODEL

Unit Power Plant with Ball-Bearing Motor Retained with Refined Details—Wheelbase Lengthened and Hood Tapered.



With a tapered hood of the latest style, a longer wheelbase, a smoother running motor and various other detail refinements, the Krit car, produced by the Krit Motor Car Co., of Detroit, has been put forth in its latest form at a slightly increased price that is justified by the improved qualities of the sturdy machine. The general design of the car and the construction of the motor have been altered but little. The motor has not been changed in its essential features in four years, though in the new model the reciprocating parts have been lightened and more accurately balanced with a view to minimizing vibration. The Krit now costs $950, as against the former price of $900. With Disco electric starter the price is $1,050. Electric lights are included in regular equipment.

The wheelbase, having been increased by two inches, now is 108 inches, and though the difference is not very great, it is sufficient to add somewhat not only to the appearance but also to the easy riding of the machine. The fenders have been crowned and given a more flowing curve and, with the tapered, round-topped hood, add not a little to the good looks of the "ensemble." The body is of the five-passenger touring type, leather lined, with cork-linoleum covered floor and running-boards and nickel binding. The gasolene tank is housed under the cowl and behind it is the instrument board of polished wood.

The unit power plant system that has been a Krit feature from the first is retained, the rearward extension of the casing enclosing the multiple disk clutch, which runs in oil, and the three-speed selectively controlled gearset. The cylinders are cast en bloc with integral jackets and heads, and the compactness of the motor is increased in no small degree by the fact that the two-bearing crankshaft is carried on large annular ball bearings. It is stated that the load capacity of each bearing is 3,400 pounds. The connecting rod bearings are, of course, plain, and are of large size, liberal dimensions at these points being permitted by the absence of intermediate main bearings. The flywheel is utilized to pick up oil from the bottom of the casing and force it into a main conduit, whence it is carried to the crankcase and maintained at constant level by means of stand pipes. The pistons and connecting rods are lubricated by splash.

The lubricating oil reservoir has a capacity of one gallon. The engine is rated at 25 horsepower, and its makers are particularly proud of its smooth running qualities and its ability to stand up under the wear and tear of hard service. Current for ignition is generated by a Bosch magneto and a Stromberg carburetter attends to the needs of the motor in the way of gas.

The Krit car is sold with full equipment, which includes the electric lights already referred to, an electric horn, demountable rims, built-in windshield, top and side curtains, and the customary outfit of tools and tire necessities.

Used Car Men and Financiers Fall Out.

Although somewhat involved, the financial relations of the Buyers-Sellers Automobile Co. and the Miller-Brisben Co., Inc., the former a financing and the latter a used car concern, were straightened out in the New York City Court last week when a verdict of $552.59 was given the Buyers-Sellers against Miller-Brisben. It grew out of a financed sale of a used car.

According to the alleged agreement, Miller-Brisben sold used cars and the Buyers-Sellers financed the buyer in case he had not the ready money; for this they got a bonus of 10 per cent. on the sale and 6 per cent. interest from the buyer on the amount loaned him. One of these deals involved several notes, one of which Miller-Brisben claimed was to have been extended when it fell due.

Extension, however, was refused and relations were severed which, Miller-Brisben claimed, made it impossible for it to do further business and thus made it impossible for it to meet the note. However, the court ruled that the alleged verbal agreement as to the extension did not affect the note, which was for $500, and judgment was given.

Cash Register Men Take up Three-Wheeler.

The Wagenthals Motor Co., of Detroit, with an authorized capital of $500,000, which succeeded the Wagenthals Motor Car Co., has completed its organization by the election of William O. Pflum president and treasurer and Howard C. Turner secretary and sales manager, both of whom have for some months been engaged in putting the enterprise on its feet. Pflum succeeded Hugh Chalmers as general manager of the National Cash Register Co., from which he retired about a year since, and Turner was formerly sales manager of the Elmore Mfg. Co., and also at one time identified with the Cash Register establishment. The new company will continue the manufacture of the Wagenthals three-wheeled delivery car.

"GRAFTERS" WHO DON'T REALIZE THEY "GRAFT"

Buyers Who Hint at Entertainment for Themselves a Thorn in a Tire Man's Side—Reilly Explains How Others Than Buyers Exact Tribute in a Petty Way—Favors to Those Who Fawn on Authority.

"Reilly, you hairless dog! When are you going to stock our tires?"

"As soon as my present stock runs out, you rubber peddler! Why?"

JERRY SULLIVAN, CHAMPION OF EVERWEAR TIRES, GENTLY TOOK REILLY'S ELBOW

"Oh, nothing; except that I've been trying to sell you Everwear tires for three years and I haven't sold you one yet. But seeing that you have decided to recognize a real tire, I'll buy a drink, or a smoke, or a sandwich, or anything else."

And Jerry Sullivan, long-time champion of Everwear tires and old acquaintance of the dealer, picked up his grip from where he had dropped it on the sidewalk, gently took Reilly's elbow and steered the little dealer to The Mathcroft and in through a door where women never entered—except tambourine-bearing Salvation Army lasses.

Most Satisfactory Expense Money.

"Now, Reilly, what is it?" he said, as he propped his grip up on the little brass rail which in these later days is supposed to be a foot rest but which originally was intended to prevent the too jubilant from falling into the cuspidors.

When Reilly had indicated a preference—something every man is supposed to have even if he doesn't brag about it—Sullivan said, "Do you know why I'm anxious to buy this drink, Reilly?"

"Company pays for it, probably."

"Maybe that has something to do with it, but. do you know, it's the first time I ever bought you anything in all the years I've been waving Everwear tires in front of your face."

"I hadn't thought of that; is that so?"

"It certainly is," replied the tire vender, "and it's the most satisfactory expense money I ever spent."

"IT'S THE FIRST TIME I EVER BOUGHT YOU ANYTHING," EXPLAINED THE TIRE MAN

"In what way? What do you mean? Don't they mix good drinks in your town?"

"Kidding again, aren't you? I know you can't help that; but, just the same. buyers like you aren't the most numerous thing extant. I've spent hundreds of dollars since I've been selling tires and a lot of it might just as well not have been spent. There's more 'graft' paid out in the selling business than there is in any police department in the world and it isn't nearly as productive of results."

Buyers and Customers Who "Graft."

"Why do you call it 'graft'?" inquired Reilly, who now insisted on retaliating by depleting the cigar stock in the hotel lobby.

"It's nothing but 'graft' pure and simple," asserted Sullivan, after the two had taken possession of well-worn and shiny leather chairs. "After you've been through all the ramifications of the business as I have it sort of galls you to be obliged to spend money on buyers and customers who have become possessed of an idea that they are entitled to have about so much spent on them just because they happen to be in a position to spend a little money for goods now and then. They may not come out flat-footed and demand it, but they expect it, and many of them are quick to show their displeasure if they don't get it.

"With you it's been different, and that, I believe, is one of the reasons why I have found it a pleasure to become acquainted with you and have come to regard you as one of the best friends on my beat. I can talk to you as freely and as openly as to

Digitized by Google

anyone I know, and it's only because you're so fair and honest-minded——"

"If you don't quit spreading that stuff I'll can the order," broke in Reilly.

"That's all right; I knew all the time I have been making regular calls on you that you were tied up with other brands and that sometime you would want to change and might give Everwears a show. If you had been like a lot of these 'grafters' it would have taken all the trade we will get from you for several months to make up what I might have had to spend just for the privilege of dropping in to see you."

Buyer Who Gets "All That's Coming."

"Are there many out-and-out 'grafters' like that?"

"Are there! Say! I never went to school enough to be able to count that far, but—— Oh, hello!" added Sullivan in an undertone, when a natty looking young woman in a correct-to-the-letter riding habit flashed across the lobby.

"Never mind, never mind!" advised Reilly; "that's the landlord's wife. She isn't interested in tires."

"There's a buyer for an automobile manufacturing company down in Upperview who is about the worst I ever ran across," resumed Sullivan after his descent to things mundane. "He certainly gets all that's coming to him."

"Does he buy anything?"

"Yes, now and then. The company buys a few of several different brands of tires. They use one brand as regular equipment but have to carry a little of everything to satisfy their customers who have preferences. If you go to see this fellow he always manages to work into the conversation about how the salesman from such-and-such a house was along a few days ago and they had dinner at the hotel or went to the theater or something like that.

Subtle Way of Suggesting Entertainment.

"What can you do? There he is throwing into your face a suggestion that you loosen up and do as well as the last man did, and if you don't he will get a grouch on when he sees you coming, tighten up on his orders and not buy a single tire more than he is compelled to."

"Some system, eh?" commented Reilly, as he slowly and deliberately pushed the ashes from his cigar with his little finger.

"System is no name for it; if he had gotten into public office he would have been a millionaire by this time. I think he made a mistake when he picked out his vocation. And there are many more just like him—supplymen, garagemen, automobile dealers—and I suppose they exist in all businesses where goods are bought and sold. These avaricious parasites just 'graft, graft, graft' like a bunch of Oriental customs officers."

"Yes," supplemented the automobile dealer, "and you don't have to look to buyers to find that sort of thing, call it 'graft' if you will; you can find such attitudes, dispositions, conduct or whatever it is in men, positions and lines of trade too numerous to mention."

"Just how?"

"Just as you described," replied Reilly. "By hinting for favors and fishing around for anything they can get for nothing. It seems to grow in some people in proportion as they rise in positions where they are in a shape to hand out anything. They used to have an advertising manager up at the

"IT'S NOTHING BUT GRAFT, PURE AND SIMPLE," ASSERTED SULLIVAN

factory who was the limit that way. He could dig up more free dinners than any other three men in the whole shop. It got so they used to call him Hallroom—when he wasn't around."

"Hallroom boy; that's good!" laughed Sullivan.

"Yes, they used to say he was trying to cut down on his board bill. The company's advertising appropriation for a year would be all made and the whole campaign laid out, but still he would continue to string the magazine men along. They would call to see him and ask how chances were for their publications. If they could have seen the year's layout they wouldn't have showed up for months, but this lad used to lead them on, talk wise and hint at plans which were maturing and the poor magazine boys would scratch his back, take him out to dinner and spend their good expense money.

"This same lad is a good illustration of what possibly is a form of 'grafter' somewhat removed from the particular breed you first mentioned, but in principle it's the same thing. He would favor any of his stenographers or subordinates who would fawn upon him and do favors for him. There was one stenographer who used to mend his gloves and she was always ready to do any such jobs for him. In exchange he used to give her the easy part of the work and the real work in the department was done by girls who had more backbone and who were about a hundred per cent. more efficient.

"But the efficiency of the others didn't mean anything to him—except that he knew where to go when there was any real work to be done. He was out to get all the favors he could and get as much as he could out of his job by using the authority that went with his position."

Reilly's Self Respect Stands in Way.

"He should have been an apartment house janitor," laughed Sullivan. "That would furnish him a still more extended field for his efforts."

"That's one reason, Sullivan, that I never like to accept favors from men who are trying to sell me something. My self respect never would let me do it. When a salesman comes around and mixes his selling talk with an invitation to dinner I do my best to dodge it, for after I have eaten at a man's expense it makes me feel under obligations.

"The buyer you mentioned evidently bases his orders so far as possible on the amount of money the salesman spends on him, but I think you'll find that in the majority of cases goods to-day are bought on merit and not on their eatable accessories. At least, that's the way the situation appeals to me; I buy my stuff that way."

"I think there's only one time when buying a feed does any good," replied Sullivan with seriousness.

"And that——" Reilly left the sentence unfinished.

When There Is Real Excuse for "Buying."

"——is when it is done because there seems no other time to get a chance to talk with the man you want to see," concluded the tire man. "Many men—not necessarily men in buyers' positions—are very busy and you may not be able to get to them at their offices. They may be stocking some other line and may not be able to see that it's policy even to consider your goods. Such a man often is not averse to going out to lunch with you if you approach him in the right way"—the two walked toward the street—"that's different from just entertaining to get a man's good-will."

"Why don't you show her how much more fun she could have with a car?" suggested the tire man, as the proprietor's wife disappeared down a side street which was brown with autumn leaves.

"She's stuck on that horse."

"Take it in trade."

"I might," and Reilly hesitated, "but I don't know just how to go about it to overhaul a used horse."

GIVING NEW FINISH TO CARS THAT ARE WORSE FOR WEAR

Simple Painting Operations Made Easily Understandable by an Expert—What to Do and How to Go About It.

Beauty may be only skin deep, but there may be quite a lot of beauty in a skin of paint. It goes without saying that there are few things that depreciate the value of a car to a greater extent than does the condition of the paintwork. In the marketing of used cars in particular, appearance is, almost literally, the whole thing, as nearly every one who has attempted to dispose of cars taken in trade knows. To finish a car from the rough, just as it comes from the shop, is not an easy job, and though it should not be attempted—probably never will have to be attempted—by the average garage or repair-man or dealer, refinishing a car that has been in use for a year or so and shows signs of some of the knocks it has received is not as difficult as might be supposed. It is a job, in fact, that may be tackled by almost any one who has the necessary room for the work. According to an expert who has made plain the method in the Carriage Monthly, the work amounts to little more than a coat or two of color and a coat of varnish.

The first step, of course, is to touch up any bare or fractured spots, and for this purpose a little red lead "saddened down" with a good, strong lampblack and limbered up with some raw linseed oil is the proper thing. After the fractured spots have been scraped and sandpapered out and the debris brushed away, the lead and lampblack should be applied with a small, well-pointed soft-bristle brush. The whole of the car should be gone over in this way, getting all the bare spots under a coat of "touch-up" color. The chassis should be served in the same way, grease and road dire accumulations first having been removed, using a softening material composed of one part crude oil and three parts turpentine for the purpose. Apply this material with a swab of soft cloth and let it stand long enough—several hours, or all day, if necessary—for the accumulations to soften, when they may be removed with old burlap or some other coarse fabric. The same oil-turpentine mixture should be applied to the body wherever oil or grease spots appear.

There are two ways open to the painter for preparing the body surface for color. One way, and the very best way, is to rub down with water and pulverized pumice stone. This takes everything off the surface that doesn't belong there, and, incidentally, fits it to receive the color. The second and cheaper method consists in sandpapering the surface down with No. 0 or No. ½ paper, the coarseness of the paper determining the choice. Before following either of these ways out, however, all surface defects are to be puttied with hard drying putty, and allowed 24 hours in which to dry. Face these putty spots down with rubbing brick dipped in pure turpentine in the event of sandpapering the body, and with rubbing stone dipped in water in case the surface is rubbed with water and pumice stone flour.

Possibly the old paint on certain parts of the car body, notably those parts subject to acute vibration or violent strains, show a series of force checks which, while not deep, are sufficiently so to get in the way, like a sore thumb, under the one coat of varnish practice. To put these well out of sight, temporarily, at least, break up some hard putty in turpentine to a consistency to work freely from a 2½-inch half elastic scraping knife, and face up the parts referred to. In surfacing down this putty glaze dip a block of rubbing stone, cut to a convenient size, in turpentine. Avoid using water for such work on account of the moisture likely to find its way into the crevices. This moisture during the process of evaporating serves to break the fissures into wider and deeper checks, making their last state worse than the first.

Having thus finished stopping up the fractures and fissures, and making the surface like new, with the necessary smoothness provided for, the next step is the application of the color. In this matter avoid, if possible, the use of black or extremely dark colors, such as the very dark blues or greens. These colors naturaly exaggerate surface inequalities, and for finest display require specially thorough surfacing work. Medium deep greens and blues, and light blues, with any of the beautiful browns, along with deep, rich reds, including a number of the lead lakes, are colors particularly adapted for color, and one coat varnish work.

Scarcely any of these colors, however, will furnish the requisite color density and intensity on one coat. Therefore, apply one coat of flat color and follow with one coat of varnish color, or one coat of glazing color, as it is termed, when using such semi-transparent pigments as ultramarine blue, carmine, and any one of the lakes.

In making up a varnish color, or glaze color, for one coat work, use, as a rule, two ounces of color to one pound of varnish, first thinning the color with turpentine to a cream-like consistency, and then gradually stirring in the varnish. Apply the varnish color, or the glaze color, freely to the surface, using for this work a flat, chisel pointed, badger hair brush, one small brush for wiping up and running edges and one 2- or 2½-inch width brush. As this is to be a one-coat job extra care must be taken to have a solid, uniform coat in place.

The day following the application of the varnish color or glaze coat, go over the surface with a 1¼-inch thick block of felt, saturated with water, and dipped lightly in No. 00 pulverized pumice stone. Finish off with a light water rub, and confine the rubbing process to simply "killing" the luster, and cleaning off minor surface blemishes. Run on the striping lines, if any, and then in due time apply a heavy coat of the best finishing varnish obtainable for use directly upon the flat color or the varnish color coat.

In the meantime, bring the chassis along in practically the same way, putting on in varnishing all the material the surface will carry, this being the saving factor in the matter of appearance, in all one coat varnish work. Lick over the fenders, and guards, and radiator, with something to match them up with the car in general. Brighten up the brasswork, if any, and when the car is assembled give it a close inspection, and the proper touching up to insure a well-balanced finish throughout. While a job of this kind is a comparatively cheap one, and offers no extravagant profits, it is worth while doing well up to the limit of the price received.

To Make Castings in Indianapolis.

For the purpose of producing steel castings by an electrical process, particularly for the automobile trade, the Electrical Steel Co. of Indiana has been incorporated, under the laws of that State, with an authorized capital of $100,000. It will locate in Indianapolis, where it will operate under patents controlled by H. H. Buckman, who will be the company's chief engineer. In addition to Buckman, the directorate is made up of well-known Indianapolis business men, among whom is George E. Wiedely, vice-president of the Premier Motor Mfg. Co. The others are Hugh McK. Landon, formerly vice-president of the Indianapolis Water Co.; M. Forrest, secretary of the Citizens' Gas Co., and Chester P. Wilson, president of the Interstate Public Service Co.

Philadelphia to Build Municipal Garage.

Philadelphia shortly will become possessed of a municipal garage and repair-shop. The necessary contracts have been placed by the Department of Public Safety for the erection of such an establishment at 11th and Reid streets. It will be a three-story brick and terra cotta structure, 115 x 258 feet.

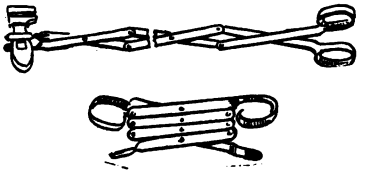
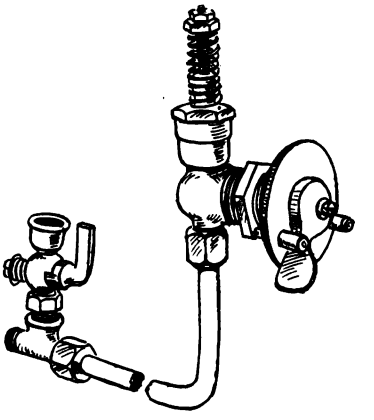
RECENT DEVELOPMENTS in ACCESSORIES

Pick-up Pliers that Relieve Perplexity.



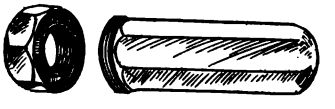
They used to call them "lazy-tongs," because you could get hold of a thing quite a distance away; and they were handy, for instance, for picking things out of a hot fire. The Bremer-Wilson Mfg. Co., of 1421 Michigan avenue, Chicago, has seized upon the idea with a timeliness that is as good for all practical purposes as originality, and produced the pick-up pliers shown in the accompanying illustration. And anyone who has ever dropped a nut or a bolt or a wrench into a crankcase or a cylinder or any other place where the job of getting it out entailed a fishing expedition with a piece of wire will appreciate the positive luxury of being able to reach 21 inches with a slender tool and neatly nip the article and bring it into the light of day. Not only can the pick-up pliers be used for rescuing lost articles, but by nipping a piece of waste or a rag soused in gasolene many interior parts of a motor can be cleaned that would be difficult and perhaps impossible to reach in any other simple way. The operation of the tool is as simple as the manipulation of a pair of scissors. It is made of good material, nickel plated and is 7 inches long when folded—small enough to go into a pocket. The price is $1.

Develops Quick-Acting Valve Cap.

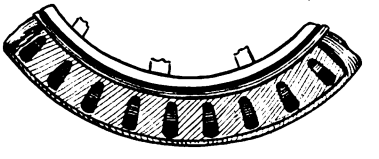


By way of facilitating the removal and replacement of tire valve dust caps, after the inflation of tires, the Burke Valve Co. of Cleveland, Ohio, has placed on the market a new type of cap which is quite different from anything else of its kind; it is shown herewith, and consists of two parts. The cap proper, instead of being threaded to fit the thread on the body of the valve, screws into threads in the nut that holds the valve in place. Hence, it can be taken off or put on in a fraction of the time required for the ordinary cap, for it is not necessary to screw it nearly the length of the valve before it brings up against its seat on the nut. The nut, by the way, can be substituted for the ordinary valve nut in about two shakes. Furthermore, the cap is made hexagonal instead of round, so that a wrench can be applied to it if necessary to ensure that it is perfectly tight.

Simplicity in Gasolene Savers.



Gasolene savers of the auxiliary air inlet type have increased and multiplied until their name now has become comparatively common; but there are few that have the simplicity and the ease of attachment of one of the most recently devised instruments of its class—the Crary auto-valve gasolene saver, manufactured by the Crary Co., of 650 Woodward avenue, Detroit. A small, neatly designed spring-controlled automatic air valve is mounted on the motor side of the dashboard, with a regulating thumb-lever on the driver's side. From the valve a copper pipe leads directly to the intake manifold, just above the carburetter, where it is tapped into a hole drilled for the purpose. That is all there is to the saver, except a priming cup attached to the fitting that screws into the manifold. The advantages of dashboard air regulation are too well known to need recapitulation; suffice it to say that the Crary device provides not only a simple air adjustment, but also an efficient priming device that is especially useful in the case of a motor that is not fitted with priming cocks on the cylinders. The saver costs $5.



B-W "PICK-UP" PLIERS

CRARY "GAS" SAVER

BURKE VALVE CAP

"NO-AIR" CELLULAR CORE

Cellular Core for Pneumatic Tires.

Making the somewhat unusual claim that it has produced a core for pneumatic tires that will give greater resiliency than pneumatic tubes inflated to the proper pressure, the Akron Airless Tire Co., of Akron, Ohio, has placed on the market a rubber core that is made in sizes to fit any pneumatic tire. The accompanying illustration shows the core, in section, in place in a casing.

The "No-Air" core, as the device is styled, is made with a large number of air cells which allow the soft rubber ample room for displacement under pressure. It is stated that the life of a casing is greatly prolonged by the use of this core, and, of course, there is no danger of trouble from punctures, blow-outs or other ills that the air-filled tire is heir to. The "No-Air" cores are made not only in various sizes, but of various degrees of resiliency, so that they can be used for pleasure cars of various weights and also for commercial vehicles.

To Make Good Soldered Repairs.

In making soldered repairs it is well to remember that the hotter the soldering iron up to certain limits where it will hold no solder at all, the smaller will be the amount of solder deposited on the work. Similarly, if the iron is not quite hot enough the job will be a "lumpy" one, as tinsmiths say. There is a temperature that is just right and it is worth the practice necessary to obtain it, for it ensures good workmanship.

Mixture that May Make Hard Starting.

All statements to the contrary notwithstanding, a very rich mixture will not permit a motor to start any more easily than will one that is just right; on the contrary, it may make starting more difficult. A mixture that is just a little richer than ordinarily is used will facilitate starting, but care must be taken not to "put the Miller's eye out," as the saying goes.

SELLING CARS IN THE FRENCH WAY IN AMERICA

Importer Who Follows the Principles Prevalent in His Native Land and Who Doesn't Follow-up—Says Fancy Dictates Choice in Top-Priced Cars—Discusses European and American Salesmen.

Selling is selling. It's the same the world over.

Many people say so and a lot of them believe it—but it isn't true.

"If an American salesman, with his American methods and his American follow-up system, tried to sell a car in France the prospect would button up his coat and trousers pockets and leave his money at home," is the way Emanuel Lascaris, who imports and sells De Dion-Bouton cars at 1672 Broadway, New York City, describes the difference that exists between selling in America and France. "The prospect would think the salesman was trying to put something over on him," he added.

Markets French Car in French Manner.

Lascaris is a Frenchman; also, the car he sells is French and, it may be added, Lascaris sells to a class of trade which is different in its entirety from that encountered by most American dealers. The reason is obvious when it is understood that a high-grade car imported from France costs often twice as much as its American counterpart and, therefore, the buyers are necessarily men of large means.

Lascaris, in marketing his imported product, has chosen to market it in the French way, and so far as his car and his trade are concerned, his methods have made good. He does not believe in following-up a man, nor does he make a half-hearted desistance from urging his prospects to buy; instead, he acts on the theory, which to an American salesman may sound erroneous, that if a man wants a De Dion he will buy it without being urged. Right or wrong, he sells cars—which is quite sufficient, so far as Lascaris is concerned, at least.

This brief description of Lascaris's methods may be taken to indicate that no selling is done at all, but this is an incorrect presumption, for, to use his own words, "The cars sell themselves." It is assumed, and generally correctly, that any man who enters the De Dion salesrooms does so because he wants a De Dion car and would not have come in had he not wanted one. Once he arrives he is shown what the line includes.

If the man then wants one he buys it. If he doesn't want it, Lascaris doesn't want him to have it, and this attitude has resulted in one of the strongest clienteles possessed by any dealer. "Some dealers say that only death can rob them of a customer," said Lascaris, "but not even death takes away a De Dion customer, for even after he is dead his family generally continues to buy De Dions."

Just what lies at the bottom of this selling method is best explained in the words of Lascaris, who says that is the way to sell to the man of business ability and sense. "That is the way cars are sold in France," he explained. "They are sold differently than they are in America because the two peoples are different. France is an older country than the United States and its people, as a whole, have more business sense. A salesman can't chase up a customer in France as the salesmen do in America; if that were attempted the French customer would suspect that the salesman was trying to trim him in some way and he would immediately close up and be a 'dead' prospect.

Comparison of French and Americans.

"It is best made plain by a comparison of the two peoples. In this comparison I am not speaking of that part of the people which buys cars but of the entire population. Take the real estate sales that are made in America; what per cent. of them is made to people who never wanted to buy at all? How many building lots are sold to people who bought because they were 'sold' by a slick salesman? After they have made the first deposit and are attached financially to their 'bargain' they have nothing to do but keep on paying. They have bought something they did not want.

Older Nation Has More Business Sense.

"They do not seem to possess business sense. They do not seem to have any more business sense than is generally accredited to women. The reason probably is that America is a younger country and has not settled down to the plane which has been reached by Europe with its centuries of history. In France they do not buy things that way. If they want them they buy them and if they don't want them they let them alone. I should say that the business sense of the entire French people compared to that of the entire American people bears about the same relation as does the business sense of an American man to that of an American woman.

"You must not misconstrue this. There are women in both countries who have great business ability, and in America there are women who are capable of directing great enterprises, but the people as a whole have not reached the development that exists in France. Nearly anyone will admit that if he wants to float a big scheme or start a 'boom' he can do it in America much better than he can in France.

"And now, to speak of my own business: People do not buy De Dions because they are good cars. I do not mean that the De Dion is not a good car, for it is one of the best in the world, but I do mean that that is not the reason people buy them. It is, however, the reason they continue to buy them,

Digitized by Google

but the reason they buy them is because they fancy a French car and one of the De Dion type.

"A man does not buy a De Dion because he wants it to take him somewhere; he buys it because he likes it. If a man wants a car merely to take him somewhere he might just as well buy a Ford for $500; the Ford will take him where he wants to go; it will carry him downtown or anywhere else, but he doesn't fancy a Ford. He fancies a De Dion; therefore he buys a De Dion.

"I do not believe in following-up a prospect. I do not believe there is a better place to sell a man a car than right here in the salesroom, for when a man is here the cars are in front of him, and the car itself is the greatest argument we have. The man can see the whole construction and get an idea of the style of body he can get, and to the people with whom we deal this is much more effective than an endeavor to convince them of something they hesitate to believe.

Salesroom Best Place to Talk Cars.

"A man's home or his office is not a good place to talk car. I don't believe I have been downtown to talk car in four years. If I go to a man's office I am likely to be kept waiting 15 or 20 minutes; that wastes my own time. When I get to him he is likely to be interrupted by telephone calls or urgent business. What I have to say is repeatedly brushed from his mind; finally he asks me to see him some other time. The whole interview is unsatisfactory because the man has not been permitted to pay full attention to my business; but if he comes to the salesroom he can think of nothing but the car and I have the advantage.

"When I see a man somewhere else than in the salesroom he has me at a disadvantage. It is like fighting the enemy in his own territory. But when he is in the salesroom I am fighting on my own ground and all the advantage is with me. Not only am I in my own territory but I have the car right before his eyes.

Never Follows-up Catalog Requests.

"Inquiries? Yes, we get inquiries, but we do not follow them up. We get a great many requests for catalogs and to these people we mail catalogs. Many times a chauffeur comes in and asks for a catalog; we give it to him, but do not attempt to pump him as to who his employer is. We also get requests from children who are collecting catalogs, and even these are never turned down. I should estimate that our written requests for catalogs net about 10 per cent. sales. We get about 1,000 requests a year and sell about 100 cars, and all this without chasing up the inquirers. The class of people which buys De Dions is not desirous of being followed up, and we act accordingly.

"Selling an imported car is different, too, in a way, from selling any American car. It is said that the difference in European and American cars is that the European car is made to fit the buyer, while the buyer is made to fit the American car. Bodies are built for the customers in European sales, while in America the whole car is built and the buyer has to take it the way it is built.

Makes the Car Fit the Man Who Buys.

"We import chassis largely and upon our salesroom floor have bodies which we show more as samples than anything else. We seldom sell a car as it stands on the floor. Sometimes a man will be satisfied with a body as it stands and will want his car immediately, in which case he takes the car as it stands on the floor. But generally he tries the seat, suggests alterations, indicates a preference in upholtsery, picks out a body color, fixes the width of doors and orders the whole thing exactly to suit his taste.

"Imported cars probably have to cater more to the trend of women's fashions than does any other line of cars. You would be surprised to see the difference the change of styles makes in the specifications of the bodies we have built. When women wore those big, wide hats we had to make the limousine doors very wide, else the women could not get in without tipping one ear over on their shoulder. But now that hats have narrowed and have been equipped with those stick-ups and plumes which are very high we have to make the doors and the roofs higher. A woman will sit in the seat of one of our model bodies, feel above her hat to see how much room there is, and order accordingly.

Car Bodies Conform to Fashion's Trend.

"The tight skirts necessitate a different seating arrangement. The women can't slide down into a deep seat any more; they have to have an extra cushion at the back, or something to lessen the depth of the seat. We have provided in several cases a hassock for their feet.

"These minor details constitute much of the selling talk with us. The most we feel compelled to do is to help a man select the size and power of car he wants. Many a man comes in to buy a De Dion but doesn't know just how big a motor he wants. If it is purely town work for which he is to use the car we recommend a smaller motor than he often first thought he wanted. We endeavor to advise a man honestly on these points."

A feature of De Dions which Lascaris believes adds to their marketable value is that while the mechanical part of a car may be changed the exterior is not noticeably altered. This makes it difficult to tell from the looks of a car just what its vintage is. The fact that a man has bought a 1913 car does not cause him dissatisfaction when a change is made in the 1914 cars, for the exteriors remain the same and it is not possible for a 1914 owner to point out the other buyer as they pass on Fifth avenue and say, "There goes ——— in his last year's De Dion." Lascaris is able to tell the difference, because he is a specialist in the line of cars he handles, but the ordinary motorist sees no difference in different series of De Dions; also, seldom are any two bodies alike.

Well Kept-up Car May Last Ten Years.

This method of manufacture enables an owner to retain his car in service as long as it lasts, and Lascaris is sponsor for the statement that ten years is not impossible for a well-kept-up car of his line. In the matter of service he is not over generous, as measured by some American standards, for, he says, "it is a purely business transaction and our owners do not expect unreasonable things. We live up to our guarantee to the letter, but we do not do a lot of little things that should be attended to by the chauffeur."

This selling of French cars in a French way may not appeal to the average American salesman, but Lascaris couldn't be induced to alter his methods. His statement that he sells about 100 cars a year does not sound like an extraordinarily voluminous business but when it is considered that De Dions sell from about $6,000 up to $10,000 and $12,000, with an average of $7,000 or $8,000 per car, the total becomes far from insignificant. It represents nearly $1,000,000, which volume of business is not exceeded by some manufacturers.

Red Cans for Gasolene in Joliet.

Dealers, garagemen and other tradesmen in Joliet, Ill., are quite likely to pay more heed hereafter to the color of the can in which they keep gasolene and oils, for because four of them failed to have gasolene in red cans they were haled into court last week by fire inspectors and fined $10 and costs each for violating section 1 of the criminal code. The offenders were the E. H. Lennon Garage Co., Van Buren and Scott streets, the Hargreaves Garage, 110 North Joliet street, The Texas Co., Lockport, and the Standard Oil Co., East Cass street, which indicates that the "big ones" are just as liable as the "little ones."

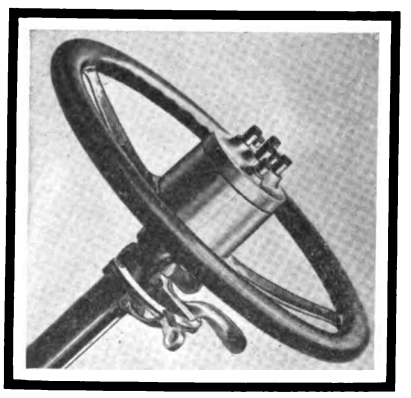
MORE THAN NEW GEARSHIFT IN LATEST HAYNES CARS

But Improvements Are Chiefly in Details—Electric Gearshift Standard Equipment, But Optional—Biggest "Four" Dropped.

The dominance of the six-cylinder motor and the adoption of the electric gearshift are the upstanding features of the revised line of cars offered by the Haynes Automobile Co., of Kokomo, Ind. As was stated in Motor World at the time of its adoption, the Vulcan electric gearshift has been included as standard equipment on all three models—one "four" and two six-cylinder machines. The former four-cylinder 40-horsepower car that was styled model 22 has been dropped, while the other "four" has had its designation changed from model 24 to model 28; the "six," formerly model 23, has become model 26 and the added "six" is model 27.

SIDE VIEW OF NEWEST SEVEN-PASSENGER HAYNES "SIX"



REAR VIEW OF LIMOUSINE

It goes without saying that the changes of designation are accompanied by such detail improvements as might be expected from manufacturers who have been in the field as long as the Haynes people—that is to say, from the very beginning of the industry—but there is a lack of radical changes that bespeaks sataisfaction with the way the machines have stood the test of service. The installation of the electric gearshift and other improvements have justified an increase of price of $200 on the "four" and the "six" that has been carried over. The long wheelbase "six" sells for $85 more than its shorter prototype. On special order the electric gearshift will be omitted, the price being reduced where hand operation is desired.

Apart from the incorporation of the Vulcan electric gearshift—which device ,incidentally, was given a thoroughly convincing demonstration in a 700-mile tour from Kokomo to Sioux City, Iowa, in a model 26 "six"—the changes that have been made are anything but radical. The gasolene tank has been suspended at the rear of the frame, which of course calls for force feed to the carburetter, an air gauge on the cowl board indicating the pressure at all times. Air is supplied by a power pump driven from the camshaft, and there is the usual auxiliary hand pump on the instrument board. The spaces under the seats are available for stowage of tools, battery box and so on; the battery box is placed under the front seat, leaving the running boards clean and clear. Leather kick pads have been placed for the protection of the finish of the interior. With a few such alterations, the Haynes cars remain as they were.

The Vulcan gearshift has been described in detail in Motor World; suffice it to say here that the usual side lever is replaced by a dial of push-buttons mounted on the steering wheel, though it is allowed to lurk in the tool box for emergency use. The operation of changing from one gear to another consists in pressing one of the buttons and depressing and releasing the clutch pedal. As the throwing out of the clutch is essential to the operation of the solenoids or hollow magnets that do the actual gear-shifting, it is clear that there is no possibility of stripping gears by trying to change from one speed to another without throwing out the clutch.

HAYNES GEAR SHIFT CONTROL

The same motor is installed in both the six-cylinder models. The bore and stroke arae 4¼ x 5½ inches, respectively; the compression is 59 pounds. The bore and stroke of the "four" are the same as in the "six" and the formula horsepowers are 28.9 and 43.35, respectively, though the dynamometer says that the "four" will work up to 48 horsepower and the "six" to 65 horsepower. The similarity of the motors does not end with the bore and stroke measurements. All the cylinders are cast in pairs and are of the L-head type. The crankshafts are of chrome nickel steel, 2 inches in diameter, and are offset from the cylinders. In the four-cylinder motor the total bearing length is 11 15/16 inches, and in the "six" 16⅛ inches. Pistons are 5⅛ inches long; connecting rods are 11 inches from center to center and the piston pin is clamped in the upper end, working in bushings in the piston. In the smaller motor the camshaft has three bearings and four in the larger. Cams are integrally formed with the shaft, and there is an eccentric which operates the combined air and oil pump, for putting pressure on the gasolene and inflating tires, and for circulating the lubricating oil.

The lubricating system combines splash and constant circulation, the pump taking oil from the engine base and passing it through a sight feed on the cowl board, whence it goes to conduits leading to the main bearings and to the splash troughs under the connecting rods. The main bearings, the idler gear and the troughs are fed directly and the cylinders are oiled by splash. The oil from the main bearings and from the idler overflows finally into the base, that from the idler first, however, lubricating the timing gears. An efficient strainer is of course part of the system.

Ignition is by American Simms magneto. The jacket water is cooled by being pumped through a Fedders cellular radiator, back of which is a pressed steel fan. On the four-cylinder car the radiator is 3 inches

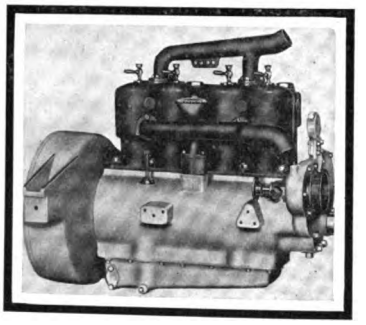
Digitized by Google

deep, and on the six-cylinder models 3⅞ inches.

The gearset, equipped with the electrical control, provides for three forward speeds and, of course, the control is selective. The gearshafts are short and heavy, of chrome-nickel steel, and run in Timken roller bearings. The rear axle in the "four" is a McCue of the full floating type and is equipped with heavy ball bearings, while on the "sixes" Timken roller bearing rear axles are fitted. All frames are of hot-rolled cold-pressed steel having a thickness of 3/16 inch. Spring bolts are of nickel steel, hardened and ground, with grease-cups formed integral, and all spring-eyes are bushed with hardened steel and are accurately fitted to the bolts.

As has been the case for the past two seasons, the Haynes cars are regularly equipped with electric lighting and starting; the Leece Neville system is installed. In this system there are two separate units, a generator for producing the current for lighting and battery charging and a motor for starting the engine. With the electric gearshifting device and the electric lighting and starting system, the car may be said to be thoroughly electrified.

Model 26, which is a "six" and differs from the other "six" in having a wheelbase 6 inches shorter, or 130 inches, is fitted with two-passenger roadster, or four- or five-passenger straight line touring bodies for $2,700. With a special coupe body the price is $3,200. The other "six," model 26, with 136-inch wheelbase, mounts either six- or seven-passenger touring bodies for $2,785 or a limousine body for $3,850. Model 28, the "four," is listed at $1,985 with two-passenger roadster or four- or five-passenger touring body, and $2,700 with coupe body. The wheelbase of the "four" is 118 inches. Standard finish includes a dark blue body with black running gear and wheels, with an option of gray body with black running gear and wheels.



When Magneto May Cause Overheating.

Improper handling of the ignition lever is not always the cause of overheating in a motor with a well-adjusted carburetter. It is entirely possible for the magneto coupling, in some cases, to become loose and permit the ignition to lag, despite the advancing of the lever, and the same thing can result from loose connections between the lever and the timer. On the other hand, loose connections of the latter variety can cause pounding due to too much advance, for the point of ignition may remain too far advanced despite the retardation of the lever when the motor slows down. These troubles may not occur often, but they are among the possibilities and should be looked for in puzzling cases.

TWO SMALLER MODELS ADDED TO LINE OF ERGON MOTORS

Standardization Feature of Both which Retain Hazard Characteristics—Pump or Thermo Cooling and Three-Point Suspension.

Having turned the proverbial order of things upside down at the beginning of the current year and started the Ergon line of motors with big beginnings—that is to say, an engine with a bore and stroke of 4⅜ x 6 inches, respectively—the Hazard Motor Mfg. Co., of Rochester, N. Y., now has produced two motors of smaller size and power than the original. While many of the features of the first motor have been retained, including the name, which is from the Greek and means strength or work, certain

ERGON STANDARD MOTOR

changes have been made, some of which are due to the smaller dimensions of the machines and others to the march of progress in motor building.

The two new motors, which are known as models C and CX, have measurements of 3¾ x 4½ and 4 x 4½ inches bore and stroke, respectively, and are rated at 20-25 and 25-30 horsepower. Similar lines are followed in both cases. Both are four-cylinder motors; the cylinders are cast in pairs and are of the L-head type and are cast with generous water spaces in the jackets to insure adequate cooling. Incidentally, the motors are fitted either for pump or for thermo-syphon cooling, the pipes for the pumpless system, of course, being considerably larger than in the pump system. The valve stems are enclosed; valve camshafts are driven by helical gears of steel and cast iron, as are also the pump and magneto, which marks a change in construction, the first Ergon having Renold "silent" chain drive.

The crankcases are of the barrel type—that is, they are not split on the center line—and the flywheel housing is cast integral with the crankcase. To the bottom of the crankcase, which is but 4½ inches below the center line of the crankshaft, is bolted the oil reservoir of cast iron, which material adds in no small measure to the stiffness of the unit. Lubrication is by splash, with pump circulation of the oil. Three crankshaft bearings are employed. Cylinders, pistons and crankshafts are accurately finished by the accepted modern method—grinding. Crankshafts and connecting rods are of high carbon steel. As an aid to smooth running, all the reciprocating parts are carefully balanced and are given a running balance test in machines devised for the purpose.

Both magneto and water pump—when a pump is fitted—are on the same side, the right, and the intake and exhaust manifolds and the carburetter are on the opposite side. Magneto and pump are driven by what is practically one countershaft, the magneto being nearest the gear, so that the omission of the pump is a simple matter and does not cause any extra trouble or spoil the appearance of the machine when thermo-syphon circulation is used.

Three-point suspension is provided for, there being two arms cast at the rear end on the flywheel housing, while the third point is a trunnion through the center of which passes the starting crank shaft. The trunnion is an integral part of the aluminum housing that covers the timing gears. Going to the opposite end of the motor, the flywheel is supplied in various forms, suitable for different types of disk and cone clutches. The Hazard company some time ago discontinued the manufacture of change-speed gears; but it is stated that any of the standard gearcases can be attached to the Ergon motors. In all cases standards have been incorporated when there were any standards, the company's practice in this respect being, therefore, abreast of the progress that has been made.

Castor Oil as a Belt Dressing.

As nearly every one who has had experience with one will testify, slipping fan belts are an abomination, though they are very easily cured of their slipping propensities if the proper material is applied. Powdered resin will stop the slip temporarily, but its action on the leather is bad, according to leather experts. By far the best thing to use is the common or home variety of castor oil lightly applied in very small quantities. The oil will soften the leather and permit it to get a grip on the pulleys. Needless to point out, the tension on the belt must be adjusted properly.

When "Strong" Butter May Prove Useful.

While "strength" in butter is not usually considered a virtue, it is a good thing in butter when that substance is used to remove spots from varnish, for which purpose it is said to be really useful.

CHAMPIONS LOCAL SHOWS AS STIMULANT TO TRADE

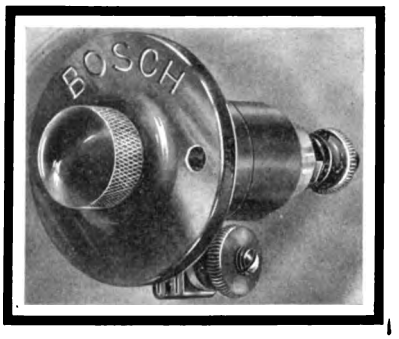
Secretary of Omaha Dealers' Association Rates Them Above State Fair Exhibits—Says the Latter Are "Time Wasted."

Editor Motor World:

I have read with a great deal of interest the article "Logical Substitute for Local Shows" in your October 2nd issue. I do not know, of course, as to where you obtained the information on which this article is based, but I believe that I am fairly well posted on this question and I wish to take issue with the statements made in your article.

I am willing to admit, for the sake of argument, that the local show may not be ideal—nor the National show, for that matter—but I do not feel, however, granting this to be true, that the State or county fair is an acceptable substitute. I disagree with the statement "If the truth were known it probably would be found that more genuine prospects are obtainable at a county fair than at any local show that ever was or may be held." If you will write to any dealer or distributer in Omaha who made an exhibit at our recent State fair, or, as a matter of fact, will investigate the situation in any State where a county or State fair is held, I believe you will find that the verdict of these dealers and distributers almost without exception will be that such displays represented time wasted.

I am not in a position to judge or criticise the local shows held elsewhere, but as conducted here in Omaha under the direct management of the dealers who exhibit, I feel that the local show is a decided success. Last year our show brought in over 1,000 dealers and each one of these dealers brought from one to 20 prospective customers. Not only were many contracts made, appointing agencies for 1913, but actual sales were effected and cars delivered at the time of the show. The show was conducted as economically as possible, and, after all expenses had been paid, there remained a good-sized sum in the treasury and a very substantial rebate was made to the members of the Show Association who had exhibited. We have had this same experience each of the eight years we have held the show, and the best indication that the dealers of Omaha feel that the local show is a benefit and a stimulant to trade is the fact that each year at the meeting when the report for the show is turned in, plans are made to hold a show the next succeeding year.



The local show does not necessarily mean "clothes" or "society," as you express it. Our show here in Omaha is designed to exhibit cars that can be used in our territory; we cater to the trade all through Nebraska, Iowa, Missouri, Kansas and South Dakota and the people who come in here for our show are here for business, pure and simple, and not for "clothes or society."

If the local shows with which the writer of Motor World's article has been familiar have been failures, it seems to me that it would be only right to first examine the management or policies of other shows before condemning the local show as an institutiton.

CLARK G. POWELL, Sec'y,
Omaha Automobile Show Association.

New Ignition Switch Added by Bosch.

To take the place of older spring plunger and key switches, the Bosch Magneto Co.

BOSCH PRESS BUTTON SWITCH

just has brought out a new type of magneto short-circuiting switch which has a number of advantageous features. Its purpose is to permit the driver of a car to short circuit the primary circuit in his magneto either temporarily, as when coasting down hill when the engine is used as a brake, or permanently, as when the car is left unattended. For either purpose the switch can be placed on the dashboard or the toeboard and operated as a pedal. The connections of the device are more than ordinarily simple: To the terminal at the rear, a wire leads to the primary or grounding connection of the magneto; a second wire, which is attached to the terminal of the collar clamp, leads to some part of the engine where a ground can be obtained. When the button or key is inserted and turned either right or left until it snaps into position, the ground connection is open and the magneto remains operative. When pressure is put upon the key, or it is removed, the primary circuit is grounded and the magneto becomes inoperative for the time being. Either the key or the knurled button is supplied with the switch and the whole is brightly nickeled and finished in the usual thorough Bosch manner.

ST. LOUIS SHOW STAGED IN GENUINE PINE TREE FOREST

Fifty-eight Makes of Pleasure Cars and Twenty-three of Trucks Housed Mid a Resinous Atmosphere—Complete List of Exhibits.

Forest Park, which is in St. Louis, Mo., looked more like a real forest last week than it ever did before—at least since civilization leveled its primeval grandeur—and the reason for the wonderfully quick out-cropping of wooded beauty was the seventh annual automobile show of the St. Louis Automobile Manufacturers' and Dealers' Association which held the boards from the evening of October 6th to the evening of October 11th. All told, some 58 different brands of pleasure cars, of which seven represented the products of electric makers, and 23 makes of commercial vehicles were housed in a pine tree park.

For the purpose, the 40,000-odd square feet of floor space under the roof was transformed into a fall forest scene with the aid of pine trees in all the glory of their autumn foliage, glory that was set off by a profusion of Southern smilax and chrysanthemums entwined among the branches. At the entrance, two immense beds of potted plants helped complete the illusion, and the exhibits were separated by white lattice fences loaded down with more smilax and chrysanthemums. The complete list of exhibitors was as follows:

Gasolene pleasure cars: Anselm-Ganahl Auto Co., Regal; Bond Automobile Co., Wahl; Buick Motor Co., Buick; Burns-Ramsden Motor Car Co., Rambler; Cadillac Automobile Co., Cadillac; J. I. Case T. M. Co., Case; Cole Motor Co., Cole; Colonial Motor Car Co., Maxwell; Dorris Motor Car Co., Dorris; Ford Motor Car Co., Ford; Franklin Automobile Co., Franklin; General Motor Car Co., Hupmobile; Grand Motor Car Co., Auburn; Halsey Automobile Co., Packard; Heinrich Auto Co., King and Palmer-Singer; Hudson-Phillips Motor Car Co., Hudson; Ideal Motor Sales Co., Meteor; Johnson Automobile Co., Moline and Empire; Kardell Motor Car Co., Reo and Chevrolet; Lewis Automobile Co., Marion and Stevens-Duryea; Lindsay Motor Car Co., Premier, Paige and Fiat; Locomobile Co., Locomobile; Marshall Bros. Livery Co., Firestone-Columbus; Missouri Motor Car Co., Marmon; Moon Motor Car Co., Moon; Mound City Buggy Co., Jackson; New York Motor Car Co., Pathfinder; Oakland Auto Co., Oakland; Oldsmobile Co., Oldsmobile; Overland Auto Co., Overland and Chandler; Park Automobile Co., Chalmers; Peerless Motor Car Sales Co., Peer-

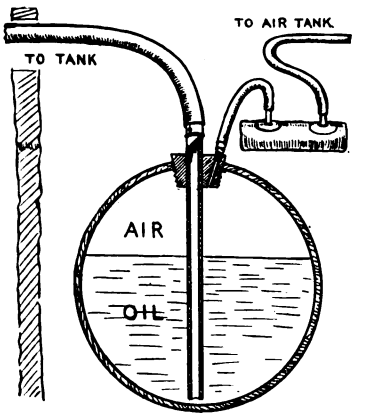
less; St. Louis Kissel Kar Co., Kissel Kar; St. Louis Stearns Auto Co., Stearns-Knight; South Side Auto Co., Stanley Steamer; Southern Motor Car Co., Haynes and Metz; Velie Motor Co., Velie; Von Arx Bros. Auto Co., Winton; Weber Implement & Automobile Co., Lozier, Mitchel and Detroiter; Weber Motor Car Co., Studebaker; Western Automobile Co., Pierce-Arrow; White Motor Car Co., White.

Electric pleasure cars: Marshall Bros. Livery Co., Columbus; Ohio Electric Sales Co., Ohio; Park Auto Co., Baker; Priesmeyer-Stevens Auto Co., Waverly; Rauch & Lang Sales Co., Rauch & Lang; The Webb Co., Buffalo; Woods Electric Vehicle Co., Woods.

Commercial vehicles: Buick Motor Co., Buick; Cabany Motor Car Co., Indiana and Knox Tractor; Dorris Motor Car Co., Dorhis; Federal Truck Co., Federal and Stewart; General Motors Truck Co., G. M. C.; Halsey Automobile Co., Packard; Igou Motor Co., Jos. W. Moon truck; International Harvester Co., International; Kardell Motor Car Co., Reo and Chase; Lewis Automobile Co., Adams; Locomobile Co., Locomobile, Merchants' Motor Truck Co., Commerce and Dart; Mogul Truck Co., Mogul; Park Automobile Co., Baker electric; Peerless Motor Car Sales Co., Peerless; St. Louis Kissel Kar Co., Kissel Kar; Velie Motor Co., Velie; Western Automobile Co., Pierce-Arrow; White Motor Car Co., White.

Moline Adopts Full-Floating Axle.

The most important change that has been made by the Moline Automobile Co., of East Moline, Ill., in its newer series cars is embraced in the substitution of a full-floating rear axle for the semi-floating member that has been used in the past. In the new axle, the wheels are carried on double annular ball bearings and the wheel flange is fastened to the wheel by eight studs and nuts. Another slight change, calculated to increase efficiency and reduce vibration, concerns the motor, in which the reciprocating parts have been lightened, though their factor of safety remains the same. The bore and stroke remain 4⅛ and 6 inches, respectively, and aside from these two changes the Moline line remains practically the same insofar as the chassis is concerned. In the bodies, the lines have been improved by the adoption of a new style bell back and appearance and wearing qualities have been made better by the use of finer grade upholstery leather and top fabric. Prices remain unchanged.



The K.-W. Ignition Co. has let contracts for an enlargement of its plant in Cleveland. The addition will constitute two one-story buildings, each 60 x 125 feet, of brick and steel construction.

BLOWING BARRELS OF OIL INTO THE GARAGE TANK

Oil Transferring Scheme That Saves Time and Labor — Making Tire Inflating Apparatus Serve Another Useful End.

It may have been perfectly orthodox in the days when steam engines were young to charge that the now famous lad was lazy because he rigged a piece of string from the walking-beam to the valve-handle of his engine to save himself the trouble of turning the valve by hand every time the groaning machine made one of its long, laborious strokes; but, nevertheless, that was not the right way to look at the incident.

In these days they do such things better; for when a man evolves a plan for doing something in an easier way than usual he is permitted to get a patent, collect all the money he can on the strength of it and take his ease for the rest of his life—perhaps. What a pity that kid couldn't get a patent on "means operated by an engine for opening and closing its valves"! He would have had a grip on the tail of the engine industry that would make George Selden's big clamps look like a pair of tweezers.

PNEUMATIC OIL TRANSFER

All of which random thoughts are prompted by the fact that somebody in the American Garage & Machine Shop, which is located at 1,411 Locust street, Philadelphia, got peeved at the time and energy wasted in transferring lubricating oil from sundry barrels to the storage tank, and, remarking, sotto voce, "Oil be blowed!" proceeded to blow it, literally, out of the barrel into the tank. While the accompanying life-like drawing shows how the idea was worked out, a few words of explanation will help things along.

As it was not practicable to empty the oil directly from a barrel into the tank, as one would empty a can of gasolene into the tank on the car, a man used to do the job with an "armstrong" pump. He used to. Now he removes the bung from the bunghole and screws in its place a tapered metal plug through which passes a pipe reaching practically to the bottom of the barrel. The upper end of the pipe is connected by means of a hose with the tank. Another hole, a much smaller one, is drilled through the plug alongside the big one, and to this is connected an air hose through which passes compressed air from the big garage tank used for inflating tires. A short piece of an old inner tube, sealed at both ends and provided with two slip valves, is used as a convenient way of making connections with the ordinary tire valve fittings.

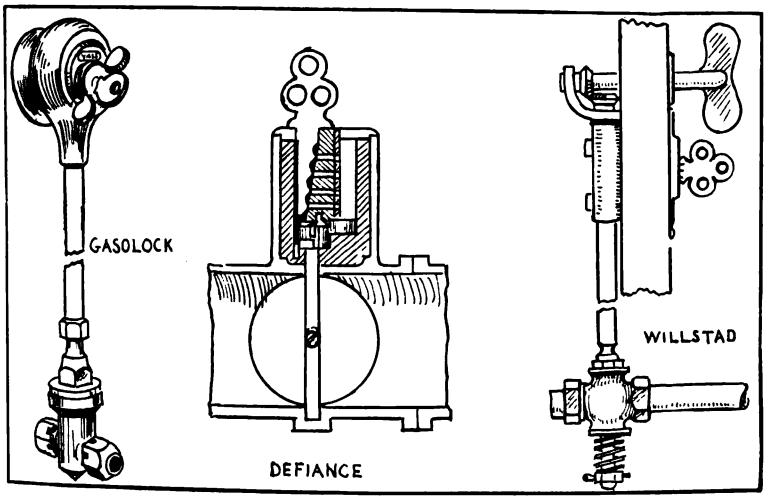
When a barrel of oil comes in, no longer do the hands look furtively at each other until the garage devil—doubtless they have devils in garages—appears and gets the job of pushing the pump, or else the boss singles out some other unfortunate to do it. Someone steps up briskly and hauls out the pneumatic apparatus, puts the plug in the barrel, sticks the hose in the tank and makes connection with the air line, turns the cock and—walks off while the oil gurgles "Well, I'll be blowed!"

Gasolene Exports and Prices Vary.

In July of the present year the export of gasolene from the United States totaled $8,054,793 gallons and was valued at $1,285,914, an average of 16 cents a gallon, while in July, 1912, the export was 7,402,652, valued at $792,331, an average of 10.7 cents per gallon; this is an increase of 9 per cent. in volume and 62 per cent. in value. The average prices of the fuel shipped to various countries varied, even in the same month.

In July, 1912, the shipments, value and average prices were: Other Europe, 20,090, $4,137, $.250; Canada, 6,605,957, $666,143, $.101; Argentina, 47,500, $8,175, $.172; Brazil, 344,200, $49,485, $.143; British Oceania, 220,800, $37,942, $.171; Other Countries, 164,099, $26,449, $.161. The shipments, value and average price in July, 1913, were: Other Europe, 549,250, $91,213, $.166; Canada, 4,511,012, $643,790, $.147; Argentina, 300,000, $41,850, $.139; Brazil, 2,213,425, $408,312, $.184; Other Countries, 481,106, $100,749, $.21.

Dirt that Chokes Back Light.



The amount of light that can be absorbed or choked back by a thin film of dirt on an electric light bulb or on a reflector is simply amazing. The glass is easily brightened up with a little alcohol on a rag, or even on a piece of paper, but gasolene should not be used for the purpose.

LOCKING DEVICES THAT DISCOURAGE THIEVES

Ingenious Contrivances, for Use in the Garage and on the Road, That May be Relied Upon for Protection—Four Types of Locks Made Plain—Crippling a Car Without Totally Disabling It.

It was very quiet in the garage. Sanderson's car was the only one left in its "stall." All the others, under the guidance of their owners, had passed out and down the street, disappearing in the general direction whence the business maelstrom soon would surge. The polisher was putting the finishing touches on Sanderson's car and, after he had switched off the electric lights over the washing stand, Billy Rea, humanitarian garage proprietor, retired to his glass-encased cubby-hole of an office to smoke his morning cigar.

THREE TYPES OF LOCKS THAT STOP THE FLOW OF FUEL

When he had the perfecto burning to his satisfaction, he tilted back in his swivel chair, carefully adjusted his feet on the slide of his desk and reached for the morning paper. For a while he read contentedly, methodically snipping out the items that interested him and tucking them into pigeon holes for future reference. His cigar had burned itself nearly out by the time he reached the back page, and when his eye lit on a five-line "story" buried under the New Jersey correspondence he first chuckled a little to himself and then snipped out the item and put it under the glass top on his desk where he could see it.

It was a very ordinary item that is reprinted by nearly every metropolitan newspaper about five days a week with only the names and dates changed. It narrated, briefly, that when T. E. Cunningham, broker, went to find his car, after having left it standing in front of his office for about 15 minutes, the car was missing; the efforts of the police to gain a clue to its whereabouts had proved unavailing.

As Rea consigned the much-mutilated newspaper to the waste basket, the clipping under the glass desk top again came in his line of vision and the sight of the paper plunged him into a sort of reverie that was only interrupted by the entrance of the bustling figure of Sanderson.

Drawing Inspiration from Scares.

"S'matter, Billy?" he heralded, through a blue haze of cigar smoke; "why the semi-cynical smile? Anybody been telling you fish stories?"

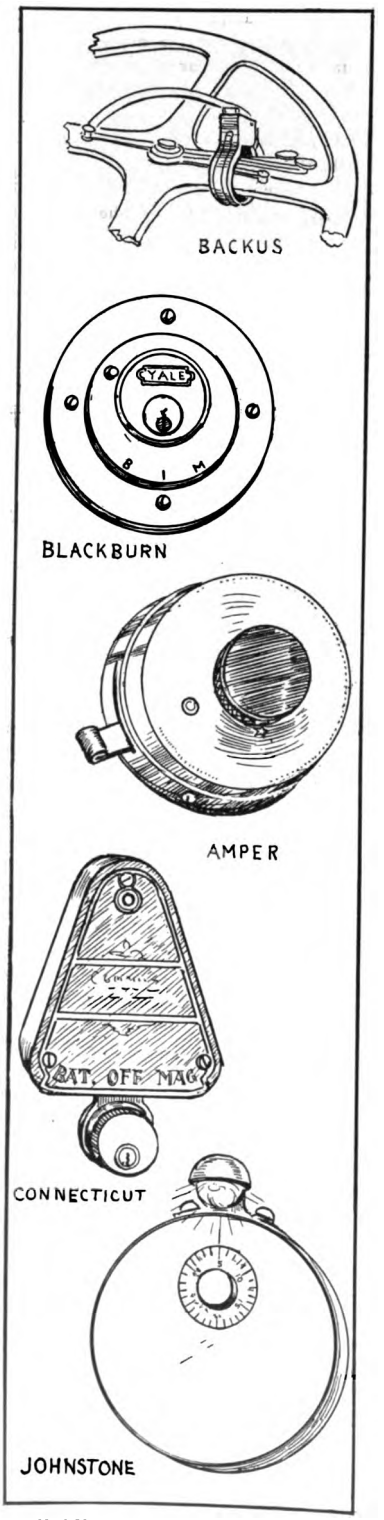
"Matter?" grunted Rea. "Matter enough; take a look at that!" he added, pointing to the clipping with a match that was due to be applied to a second cigar.

Sanderson bent over and read the clipping and when he straightened up he wanted to know "what in thunder that had to do with the price of butter in Catskill."

"Only this," elucidated Rea, "this fellow Cunningham is an average individual, I dare say, but he is a good deal like you. You never thought of buying a fire extinguisher until you were scared into it; now you would not venture out without it. But have you got any kind of a lock on your car? Is your car any less likely to be stolen than any one else's car?"

"But I can't get a lock to fit my car," Sanderson defended. "You know as well as I do that she's a pretty old boat and these new fangled trappings don't seem to fit in. I know I need one, all right, and I tried to get a gear lever lock only last week, but it was no go; the thing wouldn't fit on my old progressive lever."

Locks as Profitable Stock in Trade.



"Foolish mortal!" responded Rea, "do you imagine there is only one kind of a lock in the world? Do you think one kind of a lock will fit every make of car? Hadn't you ever thought that there must be a whole lot of different kinds of locks? Evidently you had not, or you would not have asked such a foolish question. Well, let me tell you for your own information that there are more than a score of locking devices and that no two of them are exactly alike. I know, because I went to the trouble to look them all up one day because I knew you fellows would get scared some time or another and would come looking for locks. I knew, too, that if I did not have some of 'em here you'd get your locks somewhere else, and letting you buy supplies downtown isn't getting me anywhere.

"Got to go soon?" as Sanderson buttoned his duster. "Well, see you to-night, and," Rea added as a parting shot, "I hope I see your car, too." As Sanderson "wound up his boiler," to express the action in the language of Jerry the polisher, Rea turned back to his desk and took out of the lower right hand drawer, which was a veritable catalog storehouse, a bunch of catalogs contained in a stiff folder labeled "Locking Devices," and over these he proceeded to pore for the rest of the morning, only disturbing himself to answer the telephone.

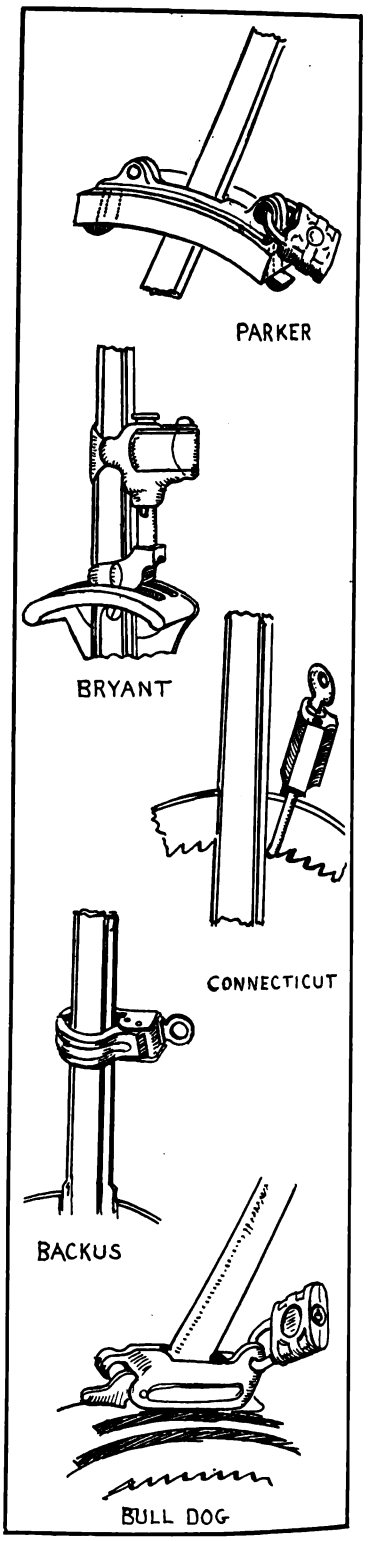
Variety Disclosed by Catalogs.

What Rea found in the catalogs any one else can find who has the inclination to do so. He found that there are easily more than a score of different locking devices, and so he was not very much surprised, but he was surprised at the variety of uses to which they could be put, or rather the variety in the ways in which they could be made to lock a car effectually. Finally, he

Digitized by Google

VARIETY IN IGNITION LOCKS

arranged the catalogs neatly in four piles, putting in the first pile all the catalogs showing gasolene line locks, in the second pile all those that showed ignition locks in their several forms, in the third pile the various devices designed to lock steering gears, and in the fourth, devices designed to lock either the gear shift, emergency brake or starting levers. And in order to avoid confusion because of the great variety that obtains, it is best in making plain the devices to follow Rea's plan—to examine each class separately.



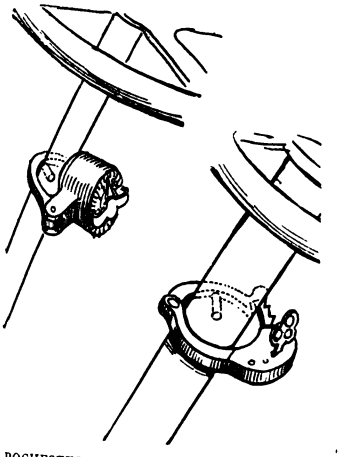
Duties of the Theoretical Lock.

To examine locking devices in the abstract makes plain that there are a number of things the ideal lock should do and a number of things it should not do. Obviously, it should lock a car so as to effectually discourage any one other than the person holding the "combination" from running the car; that is the prime requisite of any lock. But in doing so it should not lock the car so effectually that it cannot be moved in case of emergency, for instance. It should be possible, in other words, to move the car out of a garage in case of fire, or away from the immediate vicinity of a fire in the street, and because it is not always necessary to operate the engine to move a car, which on occasion can be pushed by hand, devices which lock the gasolene line so that no fuel can be passed to the engine serve an admirable purpose. Briefly, they prevent a car being stolen—unless the thief is bold enough to tow it away behind another car, which is not likely—though they do not cripple it so that it cannot be moved if necessary for the salvation of the car.

Probably the best known of devices designed for the purpose is the one that interrupts the flow of fuel from the tank to the carburetter; obviously not enough gasolene would remain in the carburetter to permit of the car being driven very far. The Willstad lock is of this type; it is made by the Willstad Mfg. Co. of Chicago, Ill., and as the accompanying illustration makes plain, it is designed to be placed either on the dashboard or on the heel board. In its essential elements it consists of a Yale lock and a long lever which connects with the valve proper in the fuel line. When the little lever is turned the lock locks itself; the Yale key unlocks it. The Gasolock, which is produced by the Auto Lock and Specialty Co., of Detroit, Mich., operates on exactly the same principle, the essential difference being that the keyhole is placed in the center of the thumb button.

Shutting Off the Flow of Fuel.

Departing a little from the idea expressed by the Gasolock and the Willstad, the Defiance lock, which is produced by the Defiance Manifold Lock Co., goes a little further and prevents the car from being operated on even what gasolene may be left in the carburetter. Instead of locking the



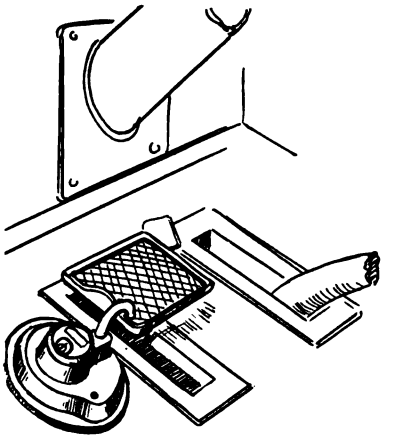
LOCKS FOR GEAR LEVERS

Digitized by Google

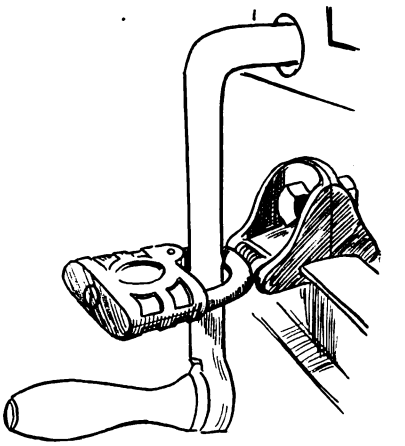
fuel line, the Defiance places an effectual bar to the entrance of "mixture" into the cylinders, as is shown by the picture. Like the others, the Defiance incorporates a Yale lock, though unlike them it is fitted to the intake manifold. The device is nothing more complicated than a simple butterfly valve and it can be fitted to almost any manifold.

Locking the Ignition Apparatus.

Devices that lock the ignition switch are not new, of course, for there is scarcely a manufacturer of ignition apparatus who does not produce at least one lock of the kind; incidentally, a great many cars as they come from the factory are equipped with ignition locks, though there still remain quite a number of devices on the market which are suitable for and can be attached to older cars not so equipped. Locks of this type, too, have the advantage that



ROCHESTER COMBINATION AND KEY



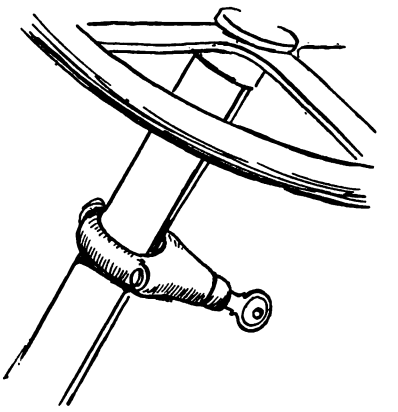
they do not cripple a car, though they effectually prevent the unwelcome attention of those who have no moral right to the property of others.

The Blackburn Autolock switch, which is produced by the Blackburn Specialty Co., of Cleveland, Ohio, belongs in this class and the type that is illustrated has been especially devised for attachment to Ford cars. As the picture shows, it is little more than the conventional Yale lock in appearance. In operation, the key, which also serves as the switch handle, can be turned either to the right for the battery or to the left for the magneto. Except when the key is in the neutral position, with the current turned off, the key cannot be removed; even when the screws holding the switch are removed, the lock cannot be tampered with. In the Connecticut lock, which is made by the Connecticut Telephone & Electric Co., of Meriden, Conn., the operation and principle are just the same, though the location of the Yale lock is slightly different, as is made plain by the picture.

By way of eliminating the possibility of inconvenience resulting from lost or mislaid keys, several manufacturers have developed ignition locks that are released by a combination, two of them being shown herewith. In the first, which is made by the Johnstone Auto Lock Co., of Cleveland, the appearance and operation of the combination mechanism is exactly the same as that on any safe, and so that the device can be operated at night equally as well as during the day, a tiny pilot lamp is mounted over the combination knob. In the other, which is produced by the Amper Electric Co., of Lockport, N. Y., sight of the lock is not necessary for indication of the combination is given audibly. In other words, the knob is turned right or left, according to the combination, a certain number of "clicks,"

TABOR PEDAL LOCK

BREMER-WILSON CRANK LOCK



the number being determined when the combination is set.

Device With Variety of Uses.

The Backus lock, which is made by the Backus Novelty Co., of Smethport, Pa., differs from any of the others in that it can be put to a variety of uses. In one illustration it is shown clamped around both spark and throttle levers and in another it is shown fastening the gear shift and emergency brake levers together, and in either case the lock is effective in preventing both theft and "joy" riding. The lock is in effect a padlock, though it is more like a set of mechanical fingers which can be clamped around anything clampable. The fingers need not necessarily be together, for they will lock in any position; they are released, of course, by a key. The particular advantage of this lock lies in its great utility, for not only can it be used to lock the car itself but it is equally serviceable for locking robes to the robe rail, or gloves to the steering wheel, or tires, or tool boxes, or very nearly anything else; it is, in fact, a good deal more than a mere car lock.

"Tying Up" the Steering Gear.

It is obvious that if a vehicle cannot be steered it cannot be driven very far, and

NO-RISKO STEERING GEAR LOCK

hence several makers have adopted this very obvious method of locking a car against theft. Among the pioneers in this line, the No-Risko lock, which is produced by the C. J. Rogers Mfg. Co., of Philadelphia, Pa., is distinctive in that it is designed to place a double lock on the car. In its simplest aspect it is nothing more than a small plunger controlled by a Corbin spring lock. The plunger is fastened to the steering column, which is drilled to receive it. Thus, when the car is left standing, pressure on the plunger effectually prevents the steering wheel being turned and at the same time breaks the ignition circuit. So that the car can be pushed about a garage, however, provision is made for locking only the ignition current by depressing the plunger only half way. In either case, the release of the plunger requires the insertion of the proper key.

The Rochester Safety lock, which is made by the Rochester Safety Lock Co., of Rochester, Ind., is quite similar to the No-Risko except that it is little more than a

Digitized by Google

padlock with a plunger on its movable arm and that it does not break the ignition current. In operation, the lock is placed around the steering column with the plunger inserted through a hole drilled for its reception. Two types of these locks are produced, one being released by a combination and the other requiring a key; both types are illustrated herewith.

Temporarily Crippling Gear Levers.

If it is impossible to drive a car very far with the steering gear locked so that it cannot be moved, it is no easier to drive it with the gears locked in neutral. The gear lever lock, however, possesses the advantage that it still permits the car to be moved about a garage, and if necessary it could be towed out of danger from fire. Of the several devices of the kind on the market, the Bryant, which is produced by the E. H. Bryant Co., of Cleveland, Ohio, probably is best known, for it was among the first of its kind to make its appearance.

The Bryant lock consists of a body fastened permanently to the lever and having a pair of offset wedges at its lower end Ordinarily the whole device is held clear of the H-plate by a spring contained in its body and it offers no hindrance to normal gear shifting. To lock the car, the lever has only to be moved to neutral and the whole device pushed downward when the wedges fit into the slots in the H-plate and prevent the lever being moved. The turn of a Yale key releases the lock.

The Bulldog lock, which is made by the Consolidated Machine Works of Chicago, Ill., and the Parker, which is produced by the General Utility Co. of Philadelphia, Pa., both are somewhat like the Bryant lock in operation, though instead of attaching to the gear lever, both attach to the H-plate, the Bulldog remaining permanently in place and the Parker being put in position only when the car is to be locker. Both of these devices make it impossible to move the gear shift lever after they have once been set and in both cases a small ordinary padlock is used.

Brake Lock Constitutes Insurance.

It is equally hard, of course, to start a car with the brakes locked—or it should be if the brakes are in good condition—as it is to start it with either the steering gear, the ignition, the gear shift lever or the gasolene line locked, and with this fact in mind the Connecticut Telephone & Electric Co., of Meriden, Conn., has brought out the brake lock that is illustrated herewith. In operation, the lock is placed around the emergency brake ratchet quadrant after the brake has been set, and as a great many cars are so constructed that the first movement of the emergency brake lever disengages the clutch, the lock does not prevent the car being moved, for the car can be locked by moving the lever only enough to disengage the clutch without setting the brakes. Manifestly, where cars are left standing on a grade, the mere fact that the brake can be locked constitutes practical insurance against damage resulting from inquisitive youngsters or malicious individuals of more mature years.

Locking the Clutch and the Crank.

By way of providing a positive lock, the Loveley Sales Co. of Detroit, Mich., has attacked the problem in another way—the very simple way of locking the clutch out of engagement. Its product, styled the Tabor lock, is illustrated herewith and scarcely requires description. It is little more than a movable hook that is fastened to the floorboards and than can be swung around so as to hold the clutch pedal down. When the proper key is used, the hook can be moved clear of the pedal and is so small that it cannot interfere with the operation of the car.

The Bremer-Wilson Mfg. Co., of Chicago, Ill., which produces accessories in considerable variety, has attempted a solution of the problem in still another way, the theory being that so long as the engine cannot be started, the car cannot be stolen. The method is made quite plain in the accompanying illustration, though obviously it is applicable only to cars that still carry their starting cranks in the conventional place. The device itself consists of a hinged padlock which is clamped to the frame in such a way that when the starting crank is down the lock can be swung over it and fastened.

Meets Situation with Old-Time Law.

With so many cities juggling with their traffic ordinances in an effort to regulate the taxicab business it may appear novel that St. Paul, Minn., should find a way out of an "overcharging" situation through the enforcement of an ordinance which was passed in 1884; this statute requires that the driver of every vehicle which operates for hire shall pay a yearly license of one dollar and wear a numbered badge. The city has charges, which were fixed by an ordinance in 1909, and upon recent complaints that chuffeurs were overcharging, the mayor ordered the enforcement of the 1884 ordinance that the complaining passengers may make a record of the offending chauffeur. Also, any chauffeur found guilty will be barred from driving.

The ordinance governing fares, which is to be more strictly enforced, fixes $5 as the maximum charge for the first hour for seven-passenger touring cars and $4 each for each additional hour, but the charge for a 10-hour day must not exceed $25; for five-passenger cars the ratio is $4 and $3. Passengers, however, will be taken from the depot to hotels for 50 cents each, light baggage included.

The rate for taxicabs is not more than $1.50 an hour or not more than $1 for each succeeding hour. Fifty cents a mile for each passenger also is fixed by the ordinance.

Officials of the taxicab companies and owners of hired cars declared that they would fight the order. They contend that they cannot run an automobile with profit at the rate of $1.50 per hour named in the ordinance and will carry the case into the courts.

Policeman-Garageman Loses His Job.

Many of Chicago's citizens earlier in the year were puzzled to know whether John V. Lacey was a police sergeant, a garage proprietor or both. Lacey insisted he was a sergeant, but certain accusers maintained that he was both. Lacey found out last week from the Civil Service trial board that he isn't a sergeant any more, but whether he will blossom out as a really truly garageman has not yet developed. He was dismissed for trying to mix business and police duty.

"Sergeant Lacey while on duty at the Fifth precinct station managed an automobile garage known as the Chicago Auto Livery, 3443 Wabash avenue, between July 1 and 31, 1913," said the Civil Service Commission in the charge on which Lacey was found guilty. "He also furnished for public hire an automobile carrying a license issued by the State of Indiana in violation of the laws governing public motor vehicles."

Mrs. M. H. Lamont 2953 Vernon avenue, where the sergeant roomed, asserted she was sole owner, and produced vouchers purporting to be signed by herself to prove it, but direct evidence was introduced as to Lacey's connection with the livery.

A Really New Use for the Automobile!

So many novel uses are found for automobiles in these days of efficient publicity men that it has to be a good one to merit more than passing attention, but out in Canton, Ill., last week Lewis Howell, who is a farmer, not a publicity man, furnished the material for a very good story.

His barn caught fire from spontaneous combustion and the blaze was in such a place that the fire fighters could not get at it. The whole structure seemed doomed until someone had a happy thought. He backed the form's high-horsepowered gasolene tractor plow up to the side of the barn, hitched a chain to the framework and the tractor walked away with the side of the barn. The fire fighters then turned a stream of water into the alfalfa.

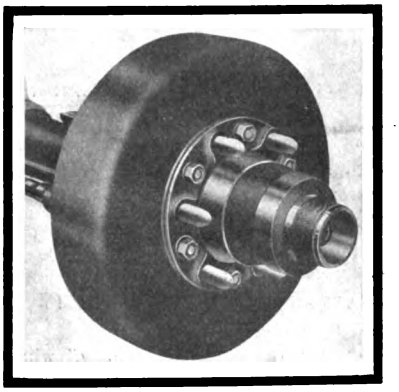
HOUK WIRE WHEEL DESIGN ELIMINATES OLD TROUBLES

One Self-tightening Nut Centers and Locks Wheel—No Adjustments to Forget—Spoking System Provides for All Stresses.

It often is discovered, after more or less experience with various different ways of doing a given thing, that the simplest way is the best way, all things considered; and an excellent example of this is to be found in the locking system of the Houk detachable wire wheel, the product of the Houk Mfg. Co., of Buffalo and New York. As has been stated in Motor World, the Houk company is the reorganized and refinanced McCue company, in which George W. Houk, of Philadelphia, recently acquired a controlling interest; Houk brought with him the American patent rights to the Rudge-Whitworth detachable wheel, and upon these patents is based the triple-spoked, automatically locking detachable wire wheel that the company is manufacturing.



The triple spoking enables the wheel to resist various stresses—vertical stresses due to the weight of the car, torque due to the application of driving power and lateral stresses due to side thrust. Triple spoking is the result of a process of evolution that passed through more problem phases than would seem possible, for at first thought the matter seems simple—which it is not. In the old spoking system two rows of spokes, one from each hub flange, extended to the rim; each pair of spokes formed a triangle with the hub as a base and a point beyond the rim as the imaginary apex. The stability of a triangle—its ability to resist lateral pressure—depends upon the width of its base in proportion to its height. As practical considerations make it impossible to bring the ends of the spokes close together in the rim, and so bring the apex low while maintaining the base width, the effect was that of a high, narrow triangle, with little resistance to lateral pressure. Further, in this system the tread center was held out somewhere near the middle of the hub, whereas its proper place is in a line passing close to the inner flange and the inner and larger bearing. With the idea of correcting the position of the tread the plan was then adopted of crossing the spokes, running the spokes from the outer hub flange to the inner side of the rim, and vice versa, and setting back the rim by lengthening the spokes springing from the outer hub flange, shortening the inner row of spokes and, of course, changing the angles. The Houk company states that while this system produces a wheel that is statically strong, it does not meet all the requirements of actual road work.

In the triple spoking system, which has been found to possess the required stability in all directions, there are three rows of spokes, two springing from the inner hub flange and one from the outer flange. One of the inner rows is vertical, running

HOUK WHEEL COMPONENTS

directly from the flange to the inner edge of the rim; in the inner row the spokes run to the outside edge of the rim, the two rows making a triangle with the inner hub flange as the apex and the rim as the base. The third set of spokes extends from the outer hub flange to the outer edge of the

DRIVING STUDS IN DETAIL

rim. The theory is that the spokes that are vertical carry part of the radial load and transmit the driving stresses, while the spokes placed at an angle take care of the lateral thrusts; and it is said that theory and practice agree perfectly, for the triple-spoked wheels stand up and remain true under the most trying conditions.

The very essence of simplicity is embodied in the hub locking device, and this element of simplicity is of the utmost importance in a detachable wheel, where the forgetting of some little thing, however, simple, might lead to serious trouble. In the Houk wheel there is nothing to forget, if the wheel is put on at all, and even if part of the attaching process—which is simply the screwing up of a nut—is neglected or forgotten the nut will automatically and properly tighten itself.

The hub consists of two parts: the inner hub, which is permanently mounted on the axle end or steering stub, according to whether the wheel is a driving or a steering wheel, and carries the ball or roller bearings, and the outer hub or shell from which the spokes spring and which is part and parcel of the wheel itself. It is the office of the locking device to hold the wheel in place on the inner hub while permitting its removal easily and rapidly.

The inside flange of the inner hub is provided with a ring of horizontally projecting studs which enter corresponding holes in the inner flange of the outer hub when the wheel is pushed into place on the axle end. The studs transmit the driving stresses. The outer end of the inner hub is threaded and upon the thread is screwed a nut that is a rather loose fit on the threads. The inner edge of the nut is beveled, and the beveled part is split in several places. The outer end of the bore of the shell hub on the wheel proper is internally beveled, the taper corresponding with that of the split nut. Therefore, when the wheel is put in place on the axle with the driving studs entered in the holes, and the tapered nut is screwed home, its beveled surface is wedged into the beveled bore of the outer hub, and the wheel is pushed hard home and at the same time is centered. Further, the wedging action causes the inner end of the split nut to be forced down against the thread, so that it is clamped hard and tight in place and movement is impossible.

Simple though the device is, there is still more to it than this. The threads are so cut that in order to tighten a given nut it turns in the opposite direction to that in which the wheel turns when the car is running forward; on the right side of the car the threads are left-handed, and on the left car side they are right-handed. If a nut is not properly tightened the fact that there is a slight difference in the diameters of the nut and the thread it screws onto results in a differential action when the wheel rolls forward, gradually screwing the nut into place. A very short run suffices to fully tighten the nut, which cannot be excessively tightened because the clamping action equalizes the differences of diameter and stops the differential action, and running backward has no effect because the wedging holds the parts together securely.

Reasonable weight is a feature of the

Digitized by Google

Houk wheel, a wheel designed to take a 36 x 4½-inch tire, for instance, weighing 37½ pounds. The wheels are made in all sizes and with hubs adapted to take bearings commonly used with artillery wheels.

Simple Repair of Honeycomb Radiator.

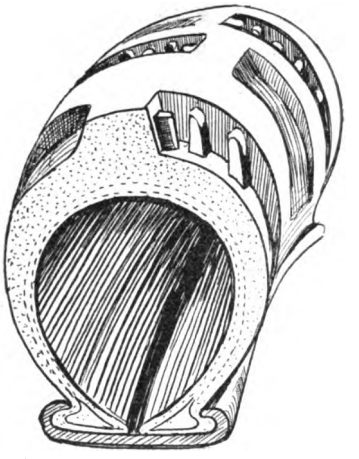
Leaky honeycomb radiators are not the easiest thing in the world to repair, though they can be repaired quite easily by any one who is handy with a soldering iron, provided only some method suitable for use by the amateur repairman is employed. If the leaky spot is filed bright with a fine file, a tiny, almost imperceptible crack will appear, and it is through this crack that the water seeps. If any attempt is made to solder the joint there is danger either that other seams will be melted open or that an insufficient amount of solder will adhere to the crack to make the job at all permanent. By far the better way is to enlarge the opening with a triangular file—used as a file and not as a lever—and then to solder into it a length of thin brass wire that has been thoroughly cleaned and coated with some soldering flux. In following this method it is a good plan to first solder the end of the brass wire to the radiator an inch or so from the break. If the wire then is left long enough it can be conveniently held in place while the soldering iron is run along it, using plenty of solder. To make the finished job a neat one, the brass wire afterward can be filed down flush with the radiator.

To Eke Out the Gasolene Supply.

Occasionally, when an engine gives symptoms of dying a perfectly natural death because of a shortage of fuel, it can be induced to fire long enough to reach a supply station by violently jouncing the car on its springs, the theory being that a small quantity of fuel may remain in one part of the tank lower than the outlet to the carburetter. This is particularly true of force feed systems where the outlet projects for some little distance up from the bottom of the tank.

Care Needed in Crossing Railroad Tracks.

In crossing a railroad track that must be taken slowly on account of high rails, it is a wise precaution to drop to a low gear so that there will be no danger of stalling the engine and leaving the car stranded and at the mercy of an approaching train.



To Keep Windshields Free of Water.

Common yellow soap is said to be about as good as anything for keeping the front of a windshield free from drops of water when driving in the rain. The glass should be rubbed with the soap and then polished with a dry cloth.

OVERMAN PNEUMATIC TIRE RETAINS CUSHION FEATURES

New Shoe, to Carry Air Tube, Built to Obtain Advantages of Solid Without Its Drawbacks—Theory of Its Construction.

Having thoroughly tried out its semi-solid cushion tire and demonstrated that while it is eminently suited to the needs of the user of commercial veheicles it is, perhaps, less desirable for pleasure cars, for a number of reasons, than is a tire which relies primarily upon air for its resiliency and which can be fitted to any standard rim by any one, the Overman Tire Co., of 250 West 54th street, New York City, has developed its original design for use with the ordinary air inner tube on ordinary clincher or Q. D. rims. The result is a pneumatic cushion tread tire that is so resistant to natural wear and to the unwelcome attention of nails or other things that may cause punctures and blow-outs that the makers feel justified in guaranteeing it for 5,000 miles of service.

OVERMAN PNEUMATIC CUSHION

The new tire, a cross section of which is illustrated herewith, differs from all other tires primarily in the thickness of its tread, and secondarily in that the tread has formed in it a series of deep indentations extending down either side alternately and slightly overlapping at the center. Between each of the indentations there are hollowed out places at the sides, the purpose of which is to assist in the radiation of natural heat. The deeper identations in the tread serve three principal purposes: They increase the resilience of the thick tread; they give it what is claimed to be a positive non-skidding grip on the roadway; and they permit natural distortion of the rubber in a peripheral direction due to the weight and progress of the car. Their purpose, in fact, is to eliminate one of the principal defects of the solid tire, which is apparent in the fact that the weight of the car necessitates that a ridge of rubber be pushed around continually while the vehicle is in motion, with the result that the tread soon loosens itself from the base and becomes detached. The indentations, it is claimed, eliminate this difficulty. The weight per tire, of the Overman pneumatic cushion is approximately 10 pounds more than the weight of the ordinary pneumatic tire.

Cable Tire Sued by its Attorney.

Charles DeHart Brower, a New York attorney, may have had high hopes for the Cable Pneumatic Tire Co. when he helped incorporate that company some time ago, but his hopes evidently failed of complete realization, for he this week took judgment against the company in the Supreme Court for New York county; he demanded $2,500 for legal services and got it, or, rather, the judgment, with interest. The tire company has an address at 315 4th avenue, but never became a factor in the tire making field.

Stromberg Branch Takes 3-Story Building.

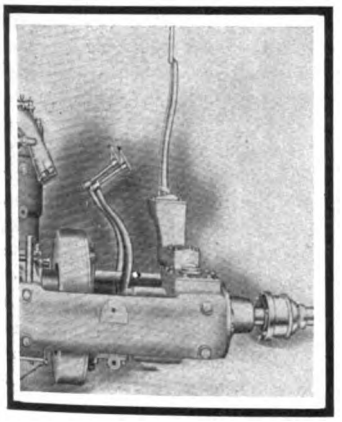
The Stromberg Motor Devices Co.'s New York branch has been removed from 1926 Broadway to 146 West 56th street. At the latter address, it occupies a three-story building, which includes separate sales and stock rooms and an extensive service and installation department. The branch, which directs the Stromberg carburetter business in all of the Atlantic Coast States, remains in charge of Roger B. Whitman.

Claims Wrong Body, but Has to Pay.

Ludwig Littauer, of New York City, claims he should not be made to pay for a used Panhard which he bought from the Cooperative Used Car Co. March 13, 1913, because it did not have the body he contracted for; but when the company brought suit in the New York City Court it secured judgment last week for $1,112.87, the balance claimed on the transaction.

McKaig-Hatch to Make Forgings.

McKaig-Hatch, Inc., which recently was organized in Buffalo, N. Y., to manufacture drop forgings and combination pliers, has located at 1584-1590 Niagara street. Its officers are Archibald McKaig, president; Harry C. Young, vice-president, and Chauncey R. Hatch, secretary and treasurer.



The White Co., of Cleveland, is again adding to its plant. The enlargement now under way will comprise a one-story building, 30 x 200 feet.

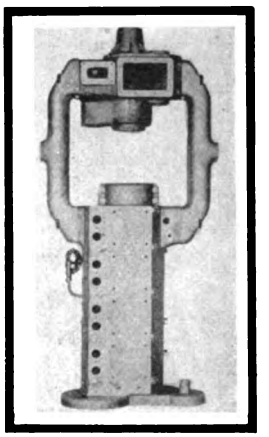
UNIT CONSTRUCTION THAT AIDS CLEAN DESIGN

Advantages That are Obtained by Uniting Crank and Gear-case—Various Types of Intermediate Housings—How Unit Construction Facilitates Suspension—Other Advantages Great and Small.

The ancient and honorable aphorism which declares that "in union there is strength" and which has such a deep significance to patriotic Americans, is applicable in many ways that doubtless did not occur to the originator of the phrase. At least, it is certain that he—or was it she?—did not have automobiles in mind when the five significant little words were put together; yet the automobile embodies in its construction not a few features that illustrate strikingly the fact that unity begets strength. For that matter, the automobile as a whole is a

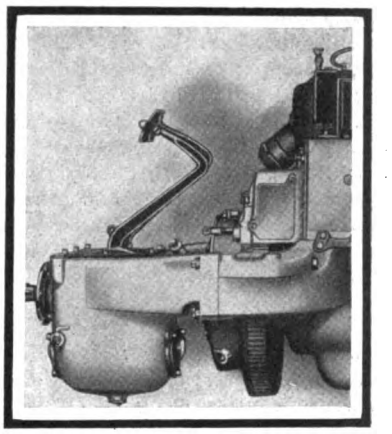


KNOX OPEN CASING

unit that certainly has amazing strength and power as the result of the unifying of many separate elements; but just now it is not so much the unity of the whole car as that of some of its components that is under consideration—to be specific, the joining together of the motor and the gearset to form what has come to be known as the unit power plant.

The fact that some cars are designed with unit power plants, while others have their motors and change-speed gears mounted separately, does not by any means signify that the advocates of the separate unit system are in error, any more than that the unit people are making a mistake. It simply goes to show that there are various ways of attaining a given end. Broadly speaking, the end sought is to produce a good car, and as good cars are built embodying both methods of construction it must be clear that both systems have excellent reasons for their existence. As to the points upon which the supporters of the two systems disagree—well, that is "something else again," and has no place here.

In the unit power plant system of construction the idea that is carried out is the joining together of the crankcase of the motor and the housing that encloses the



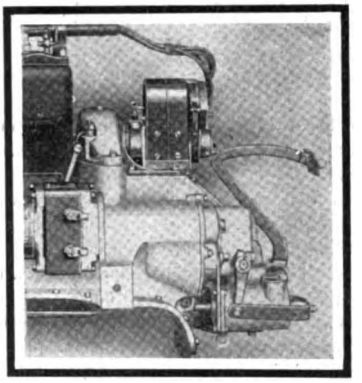
KNOX HOUSING

gears in such a way that the bearings in which the various shafts turn are held in permanent alignment once they are properly "lined up," and the entire unit can be mounted in the car without fear of its being affected by the twisting and "weaving" of the frame that is practically inevitable when the car passes over rough roads. Of course, where there can be no relative abnormal movement between the crankshaft and the primary gearshaft there can be no necessity for a universal joint, and so this is dispensed with between motor and gearset in unit power plants.

Pioneers in Unit Power Plants.

In addition to these cardinal points of advantage there are various detail benefits that are conferred by the unit idea. The housing forms an excellent means of mounting control pedals and levers, and in many instances facilitates the placing of the electric lighting and starting dynamo and motor. The housing of the clutch is such as to make it a comparatively easy matter to provide for its lubrication or to protect it from oil, according to whether it is intended to run in oil or dry. And where a motor has enclosed valve stems, as is common in modern engines, the enclosure of the flywheel puts out of sight about the last moving part that can well be covered up—which point may have no very great bearing on the actual running of the car, but has its effect in the matter of appearance, which helps some, in common parlance.

The honor of being the first American concern to adopt the unit power plant is claimed by the Stevens-Duryea Co., of Chicopee Falls, Mass., which in the fall of 1904 brought out a combined engine and



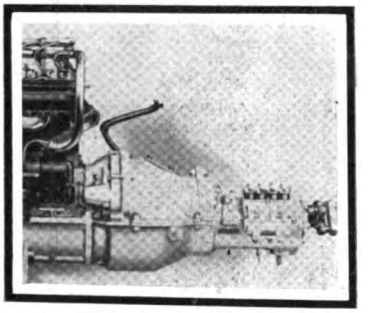
HUDSON UNDERSLUNG CRANKCASE

gearset which was mounted on a three-point support; the unit power plant on a three-point support is still a leading feature of the Stevens-Duryea car, and though many detail changes and improvements have been made in the machine in the nine years that have elapsed since the first unit model was put on the road, there is such a strong "family resemblance" between the old and the new that the relationship is perfectly clear.

In the Stevens-Duryea power plant, which includes a six-cylinder motor and a three-speed gearset, with a multiple disk clutch running dry between them, the housing is built up of sections of aluminum alloy bolted together and to the crankcase. The upper part of the housing over the flywheel and clutch is removable so that those parts are readily accessible—which is the case, by the way, with all unit power plants in which the flywheel and clutch are enclosed

Digitized by Google

—and in addition, it contains in inspection cover that when removed leaves an opening quite large enough for all ordinary purposes, the larger section requiring removal only on the rare occasions when there is



HUPP GEARCASE MOUNTING

need for removing the clutch or something equally momentous. The gearset occupies a comparatively small casing, being of unusually compact design, and upon this part of the housing is bolted the four-cylinder power-driven air-pump that is part of the regular equipment of every Stevens-Duryea. A long, tapering effect is the characteristic feature of the appearance of the housing back of the engine, and this has always been the case since this company "tied up" to the unit power plant.

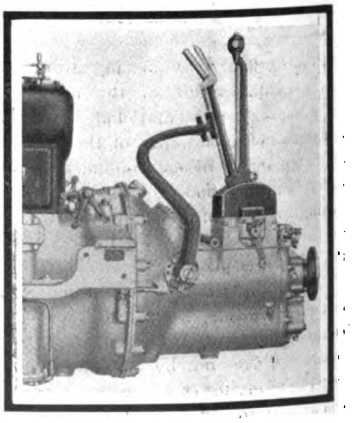
Open Space for the Flywheel.

Differing radically from many other unit power plants in that the connecting section between the engine and gearcase does not form a housing for the clutch and flywheel, the design adopted by the Knox Automobile Co., of Springfield, Mass., is distinctive and has certain advantages of its own. The crankcase and gear housing are joined by hollow horizontal arms which go around the flywheel and are bolted to the main housings; the arms are provided with lugs which take the trunnions, one on each side, which form two of the three supports and are secured to the main side frames of the car; the third point, of course, is in front, at the middle of the unit. The clutch, which has three plates with cork inserts and runs dry, is in a flywheel housing of its own where neither oil nor dirt can interfere with its smooth action. The gear lever, and, of course, the slotted plate in which it works, are mounted on the gear housing. One arm —or "leg," as you please—of the connecting section forms a support for the dynamo-motor used for the electric lighting and starting system.

The idea of carrying the flywheel and clutch in an open space between the engine and gearset is adopted also in the six-cylinder 54-horsepower unit power plant of the Continental Motor Mfg. Co., of Detroit, whose engine, to cite one conspicuous example out of many, is installed in the car that is built by the Hudson Motor Car Co., of Detroit. As the picture shows, there are differences between the Hudson Continental unit power plant and other units that are more than superficial. It will be observed that the arms which make the connection are very short. On each side of the upper half of the motor crankcase is cast half of an arm; the other two halves are cast integral with the gearcase, which is underhung, and the arm members are bolted together just back of the flywheel. In the Hudson motor the three-point support plan is carried out by locating the single point at the rear end of the gearcase, while arms of the usual type at the front of the crankcase form the other two points. One of the

STEVENS-DURYEA REAR END

connecting arms has lugs to which the starting motor is bolted, in which position the driving pinion is conveniently meshed with teeth cut in the periphery of the exposed flywheel. The clutch, incidentally, has steel disks, with cork inserts, running in oil.



Enclosed Flywheel That Pumps Oil.

Differing considerably from all the foregoing types of unit construction, the plant of the Hupp Motor Car Co., of Detroit, turns the rear housing to account in an ingenious way by making it form part of the lubrication system of the motor. The lower half of the crankcase extends backward and downward and forms an oil reservoir into which the flywheel dips, throwing oil from its rim into a collector, from which it is led to all parts of the engine. The electric starting motor is bolted to the rear housing with its shaft passing into the enclosed space and driving the motor through a "silent" chain, and on the top of the casing the magneto is conveniently and accessibly mounted. The construction is exceedingly compact, as the picture shows. The unit is carried on three points, the single point being in front and the other two about opposite the flywheel, lugs being cast on the casing at that point.

As an example of clean, symmetrical design, the power plant of the Chalmers car is conspicuous, and is a credit to the engineers of the Chalmers Motor Car Co., of Detroit. The rear end of the crankcase is extended backward, the extension being flared to make room for the flywheel, and a corresponding flare formed on the forward end of the gearcase is bolted to it, substantial flanges being cast on the edges for the purpose. An inspection plate is fitted over the clutch, which is a multiple disk affair running in oil and receiving its lubrication from the crankcase. The entire rear end of the gearcase, in which the rear bearings of the gear shafts are mounted, is removable, being bolted up to the casing proper. Despite its moderate dimensions, the gearcase covers all that is necessary to provide four changes of speed, the control being selective. The gear housing conveniently carries the gear lever, which is centrally positioned, and beside it the emergency brake lever, and both clutch and service brake pedals are journalled on the left side just back of the flywheel section of the housing. The car obviously is driven from the left side.

Unit Power Plant in Sub-Frame.

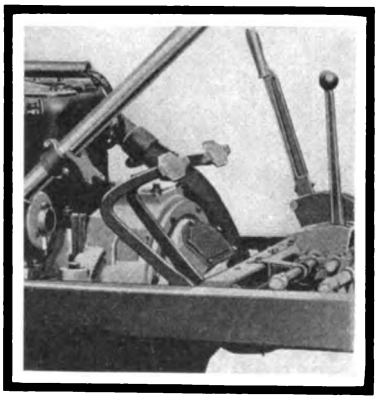
While the Chalmers power plant is not carried on a three-point suspension in the same way that the units already described are carried, the same end, protection from twists and abnormal stresses, is attained by a different method. A heavy flange or web is cast along the entire length of the crankcase on either side, and to the flanges, which are machined straight and true, the

CHALMERS HOUSING

side members of a sub-frame are bolted. Four arms project over the top of the frame and take their share of the weight of the power plant. The sub-frame, in turn, is bolted to the car framing. The crankcase, with its stiffening webs, and the side mem-

Digitized by Google

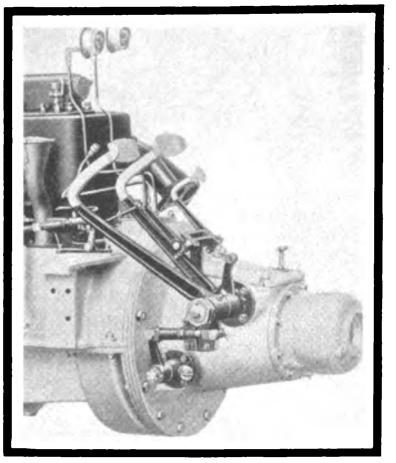
bers of the sub-frame, make up a combination that is absolutely rigid, and the gearcase, not being attached at any point to the framing, cannot be twisted or distorted.



Covering Clutch and Flywheel.

While a great many makers consider it desirable to keep the motor and gearset as close together as possible, and bring about the desired end by assembling them into a unit power plant, there are others who for various good reasons prefer to maintain the separation of the two components, but who, nevertheless, make use of at least part of the idea embodied in the unit power plant system by enclosing the flywheel and the clutch in a casing that is practically one with the crankcase. Such an arrangement is adopted by the Packard Motor Car Co., of Detroit, which places the gearset on the rear axle, and the way in which it is carried out in the "38," which is a six-cylinder motor, is shown in one of the accompanying illustrations. The upper part of the flywheel housing is cast integral with the upper half of the crankcase, while the lower half is cast with the lower crankcase section. The rear edges of the two half-castings form flanges to which is bolted the rear section of the casing which encloses the clutch. The clutch is of the multiple disk type and runs dry. Still another, and a smaller, section is bolted to the rear end of the clutch casing, and in this is housed the universal joint. Over the clutch is the usual inspection plate—a little unusually ample, perhaps—and the clutch casing affords a convenient support for the pedals operating the service brake, the clutch and the accelerator.

Front Suspension by Cross Yoke.



The method of applying the three-point suspension principle to the Packard motor is a good deal out of the ordinary. Two of the points are at the rear of the motor, just where the crankcase merges into the flywheel casing, and are formed by two arms of more or less conventional type. The third point is at the front of the motor, of course. A steel cross member, of I-beam cross-section, heaviest at the middle and tapered toward the ends, which are formed into "palms" to bolt to the side frames, is secured at its center to the motor just above ward of the front cylinder and just above the crankcase. The arrangement is a neat one, and as for its effectiveness, it hardly is necessary to say more than that it is a Packard feature.

In the case of the Marion car, built by the Marion Motor Car Co., of Indianapolis, Ind., the separation of the motor and the gearset are maintained for exactly the same reason as in the Packard—that is, the gearset is mounted as a unit with the rear axle and forms a conspicuous feature of the chassis design. The flywheel and clutch are enclosed with the motor, and though the general idea is carried out along about the same lines, there are differences that the illustration brings out clearly. The universal joint is not enclosed with the clutch, the casing terminating at the clutch-shaft bearing. There are two inspection plates on the

MARION MOTOR MOUNTING

extension housing of the Marion, one being directly over the flywheel, to permit the insertion of a tool for adjusting the rear main bearing, and the other over the clutch in the sloping face of the casing. The motor is carried on a three-point suspension, two of the points being arms cast on the rear end of the casing and the third secured to a steel

PACKARD UNIT CONSTRUCTION

yoke crossing the frame at the front of the motor.

There are so many unit power plants built and so many variations in matters of more or less important detail, that it is obviously impossible to describe all of them, or even to describe all of the more important examples. In the foregoing, however, there is sufficient variety to convey some idea of the trends and tendencies in the construction of this popular form of power plant and to indicate why it is preferred in so many cases.

Rolling Gears from Red Hot Blanks.

Making gears by a process that recently has been developed and still is in its early stages consists in rolling the teeth into shape from a blank which is put into the forming machine while hot. The blank is of smaller diameter than the finished gear, and the rolling die, which is merely a gear with accurately cut teeth, forces up the teeth from the blank and at the same time forms the spaces between, the steel forced out of the spaces rising to form the projecting teeth. The machine is a massive one and requires 30 horsepower to drive it. Gears can be turned out in a very short time—a matter of seconds only, once the blank has been placed in position—and not only is there an economy of time in the process, but there is no waste of material by cutting, as in the usual method of making gears.

As to the accuracy of the process, it is said that a rolled steel gear is within two or three thousandths of an inch of absolute accuracy in pitch and diameter. For much work, such as agricultural machinery, the gears can be used just as they come from the machine; the teeth have a smooth finish due to the fact that toward the end of the rolling process they are sprayed with oil in a cold air blast. For automobile service, where it is necessary to eliminate all the inaccuracy that is humanly possible, a light finishing cut can be taken of the finish made by grinding, the gear being rolled a trifle oversize for the purpose.

The new gears are said to be superior to cut gears in the matter of strength, because the grain of the steel follows the tooth outlines. The kneading process in the rolls also is beneficial to the metal. A further claim is that there is considerably less tendency to warp than with cut gears, due to the better grain and fiber formation. An increase of strength of 22 per cent. is claimed for the rolled gears before casehardening and of 10 per cent. after the casehardening.

While it is only recently that the rolling process for making gears has come into much prominence, work has been in progress since 1909 in an experimental way, and there naturally were many obstacles and difficulties to overcome. By making the forming gears or dies of large diameter it has been found that there is no tendency to overheat, while the spraying process mentioned eliminates the tendency of the die teeth to stick to the gear being rolled. These and many other problems caused trouble at first, but they have been overcome and the process rendered practical.

What is the biggest mistake dealers make?

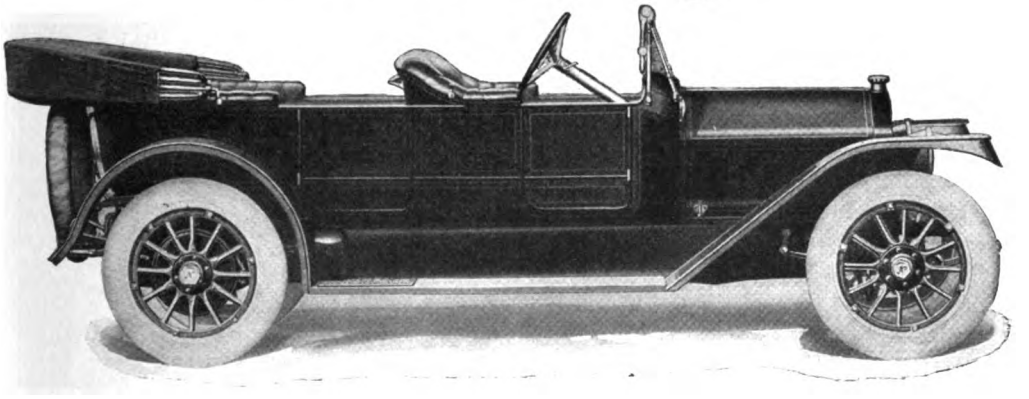
We asked this of several experienced dealers and traveling representatives for the *National* cars. We, of course, received various answers—but here is one mistake many agreed upon—

"They make promises they can't keep"

And it is explained that too often the dealer is absolutely sincere and believes he can make good on the promises he gives a customer for the car he sells him.

We have eliminated this mistake absolutely for you when selling *National* cars. In the first place the plain unvarnished truth about the *National* would be a gross exaggeration if applied to other cars. Often we find people who smile when we tell them the truth about the *National's* value. They smile until you prove it—then they do actually smile the smile that brings both a sale and a satisfied customer this year and years hereafter because the *National* is good year after year, steady, consistent, and always at the top in service, power, speed, beauty and most modern equipment.

The *National* dealer does not have to make promises he can't keep in order to force a sale. The *National* dealer promises more than other dealers and keeps his promise because the fulfillment of all the promises he makes is actually in the car he sells.



We put it in these cars in our thirteen-year-old factory. The *National's* success in contests—which makes it today the Stock Champion and International 500-mile race record holder—is one proof of the superiority of these cars.

If you are fortunate enough to be in open *National* territory please advise us at once. It will cost you nothing to learn more about our cars and the square and liberal manner in which we co-operate with dealers.

NEW DEPARTURE BALL BEARINGS

American-Made for American Trade

The Proof of the Bearing Is In Its Service

The garage man knows better than anybody the comparative service merit of the bearings installed in motor cars he cares for and repairs.

We recently sent out letters to garage men throughout the country, asking them their opinion of New Departure Ball Bearings, based on their experience with it.

The complete summary of all responses received the first week shows that 96 per cent. of the garage men who have been using New Departures found them absolutely satisfactory. Many of them went as far as to say that it has proved superior to all others.

This remarkable evidence of the quality and efficiency of New Departure Ball Bearings is absolutely indisputable. Users of foreign-made ball bearings, whether garage men or manufacturers, should give this American-made bearing a thorough trial.

Every manufacturer, purchasing agent, superintendent, and designing engineer should have the Engineering Edition of the New Departure Ball Bearing Catalog and the brochure on "Bearing Friction and Its Elimination."

Every garage proprietor and superintendent should have the new Ball Bearing Garage Manual, now in its third edition. Either one, or all of these books, will be sent free on request. Drop us a line now.

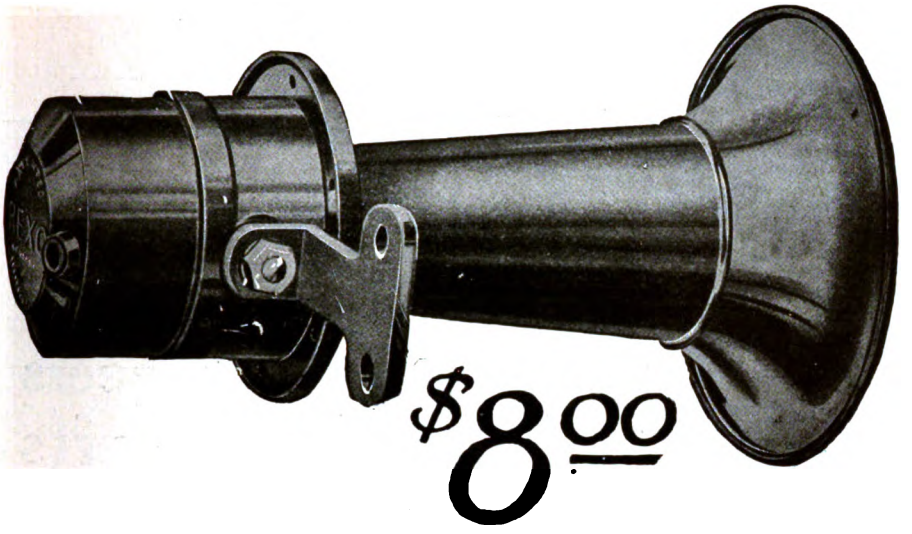
TUTO HORN

TUTO HORN—the ideal warning signal for any type of car and the only electric signal delivering TWO separate and distinct warning notes—both tones secured by operating the same push button.

FOR ORDINARY SIGNALING, slight pressure on button produces a warning note amply adequate nine times in ten. For emergency signaling, where instantaneous action is required, press push button way down—the tone secured is that harsh, sonorous, abrupt demand that all motorists and pedestrians recognize.

THE FUNCTIONS OF A true warning signal are to give adequate warning of danger—always. Our TWO-TONE arrangement is accepted by sane motorists just as different sets of gears are used for speed and hill climbing. They change gears to meet road conditions—TUTO owners signal intelligently and can always meet conditions ahead.



OUR CO-OPERATIVE DEALERS' selling campaign is under way—automobile owners everywhere will get the TUTO, REXO, MAXO story.

ARE YOU PREPARED to make Elyria-Dean deliveries? Send for our selling arrangement today—now.

We Are One of the Pioneers in Machining Crankshafts

—been machining crankshafts exclusively for years. Our plant is second to none in the completeness of its equipment. Every machine is up-to-date and the best that money can buy.

But machinery and plant are things that money can buy in the open market. They can be duplicated. Therefore we claim no special merit for ours except that they are the best.

The feature that makes MICHIGAN CRANKSHAFTS better, finer, more accurate, and saves time, money and patience on the part of the engine builder or car manufacturer is the skill and experience that comes from specializing on one particular job for many years.

You get better SERVICE all the way through when you deal with us——

Because of concentration and longer experience.

Because we limit our capacity—don't crowd—never take more business than we can handle.

Because of completer equipment—result of specializing on one thing.

Because we make deliveries when promised. And——

Because closer inspection at our plant assures fewer rejections from you. Last year we had **less than two per cent. rejects.**

We are after your business. You will like our way of handling it. Better not wait too long before sending your blue-prints.

Continental Security

At the present time it will be found more than worth the while of every manufacturer of motor vehicles to study the following resources of the Continental Motor Mfg. Co.:

The highest commercial rating of any motor concern.

Two immense factories and machinery valued at over $2,000,000.

Ten years of constant, progressive, and profitable manufacture.

Practically the same original organization.

80,000 motors in successful, daily service.

Contracts with over 60 motor vehicle manufacturers—many of them with world wide reputation.

You would not do business with a bank unless you had carefully looked into its standing and financial condition. Otherwise you would hardly deserve to weather the first period of depression that came along. Scrutinize too the reliability of your source of manufacturing supplies. It is equally important.

Continental security—as indicated by the above facts—assures the manufacturer prompt deliveries AT ALL TIMES; assures repair parts for car owners at any future date; and assures uniform quality at a uniform price.

There is nothing of the fine art of rhetoric in this advertisement, but we believe every manufacturer will welcome the candid statement of a company that not only makes America's Standard motor, but also can back up to the limit its motto "Powerful as the Nation."

Stewart Speedometer

MAGNETIC PRINCIPLE

English Authority Praises Magnetic Speedometer

In writing about it to "The Autocar," he says:

"I have nothing but unstinted praise for it. It is as near perfection as anything I have known. I have subjected it to the most searching tests with a stop-watch over a measured distance, and it has been found to be dead accurate at all parts of the scale. The indicating hand is always as steady as a rock, and as the dial is large and clearly marked, it can be easily read. The trip and total mileage recorders are also perfectly accurate."

By performances such as this, the magnetic principle has established itself in the minds of critical users as the only correct principle on which to make speedometers.

By giving satisfaction such as this—not just at first, bu during the life of several cars—the magnetic Stewart Speedometer has won its way to use on *more than a million automobiles and motorcycles.*

Insist—and the Stewart will be furnished on the car *you* are about to buy.

The Electric Automobile Business Offers Big Possibilities

Detroit Electric dealers, as a class, are prosperous. Last year their aggregate sales were double those of the dealers of any other manufacturer of electric pleasure vehicles. For 1914 we are planning a still greater manufacturing and selling campaign. The **all**-electric automobile is gaining favor with the public rapidly.

It is an all-the-year-around seller. It is adapted to both winter and summer use. It is the logical car for city and adjacent country driving. About 80% of our owners use it as the **family car.** Not over 10% are driven by women exclusively.

Now is the time to get into the electric car business. We have a **few** good opportunities open. That they will soon be gone is apparent without any argument on our part. A Detroit Electric agency is an asset worth real effort. In most cases Detroit Electric dealers are the representative automobile men in the community. We want this type of men permanently identified with us in every city throughout the United States. We will do our part to make the connection mutually pleasant and profitable.

Our entire organization is progressive. Our manufacturing methods are the most modern. And remember, we manufacture—not merely assemble. We employ experts in every department of our business. With the largest number of experienced men, making the highest type of car in the largest numbers, it is no wonder that we not only know the business from every angle, but are the acknowledged leaders in the electric automobile industry.

Our sales policy appeals to the progressive automobile dealer who wants to make money. We are in position to give our dealers sales help that it is impossible to secure elsewhere. Our experience, drawn from years of sales work in every part of the country, enables us to start our dealers right and advise them on any question that may arise.

One of our men, in a city of half a million, does $60,000 a year garage business, irrespective of new car sales, new battery sales and repair business, which amounts to very much more. The electric automobile business as we conduct it, is a **real** business.

We shall be glad to hear from gas car dealers or electric dealers handling other lines.

MESHES ITSELF
UNMESHES ITSELF

Model B
Rushmore Starter out of action

EFFICIENCY

JUST PRESS
A BUTTON

It is common to treat the efficiency of an electric engine starter as a minor matter—merely the difference of a few cents, more or less, spent for current.

But it is nearer right to say that *its efficiency goes to the very root of a starter's performance.* This is because the permissible size and weight of the storage battery and therefore its permissible current output, are limited.

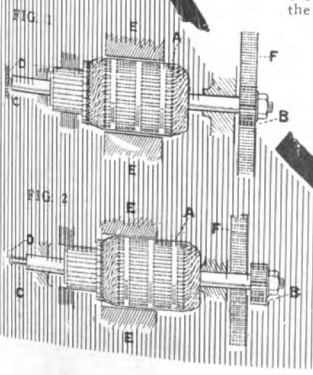
If one starter taking 100 amperes at 5.5 volts has an efficiency of 50%, while another taking the same current and voltage has 75% efficiency, the latter will spin the engine *half again as fast* as the former.

If the slower starter spins an engine just fast enough to give a comfortable start on the battery, the faster starter will snap the engine off on the magneto.

If the weather is cold, the slower starter may not suck air through the carburetor fast enough to make a mixture. Or, if the carburetor is flooded by hand in order to start, the engine may still be too cold to evaporate the gasoline. In that case no explosion can occur till the cylinders have been warmed up by repeated compressions sufficiently to vaporize the new gasoline that enters them. Under such conditions the less efficient starter will have to run the engine much longer, and hence will use considerably more current, to produce a less satisfactory result.

The RUSHMORE STARTER

delivers at the flywheel from 72 to 75% of the energy received from the storage battery. It is the only geared starter designed to operate at a speed so low that no intermediate gears are required between it and the flywheel. It is guaranteed, for equal current in each case, to spin any engine from 40 to 50 per cent. faster than any other starter on the market. As compared with most other starters, it affords a marked saving in the total weight of battery, starter, and gearing.



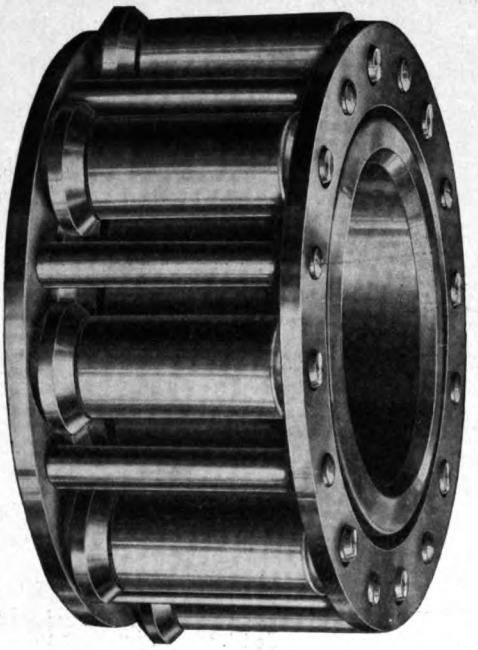


Fig. 1. The Starter in action. Pressing the switch button causes the poles E. E. to attract the armature A to the left, thus engaging the pinion with the flywheel gear.

Fig. 2. After the engine starts. The increase in speed, when the load is removed, kills the battery current for an instant, allowing the spring C to slip the pinion B out of mesh.

Rushmore Dynamo Works,
Plainfield, N. J.

"BOWER SAVES POWER"

How Bower Saves Power!

The Bower Bearing has a cylindrical roller with a flanged head at one end. The flange takes care of end thrust, the roller of radial load. This simple division of labor gives two extraordinary advantages to Bower Bearings: (1) it reduces friction to a minimum and (2) it obviates the need of any adjustment. Moreover, the raceways and the rollers being at all times parallel, the rollers are self-aligning. Thus a maximum diameter of rollers can be used; their speed of rotation is comparatively low; wear is minimized, and long life is assured to the bearing.

EVERY manufacturer of automobiles and every dealer in automobile accessories, should give most careful consideration to the material advantage of equipping and selling

GENUINE DUFF-BUILT

BARRETT AUTOMOBILE JACKS

Built on the Duff principle of highest quality and best workmanship, every Barrett Jack is carefully tested before leaving the Duff plant to withstand the most severe demands that may be made upon it.

1914 Model, No. 300
1½-Ton Barrett Geared Ratchet Jack, with both Top and Side Lift. Pawls, gears, pinion and rack of heat treated, high carbon steel. Lowest point of Side Lift 4¾", highest Lift of Head 18¾" — Weight 10 pounds.

THE manufacturer who equips his pleasure cars and motor trucks with Barrett Automobile Jacks obviates a most frequent source of dissatisfaction with equipment features.

The dealer who endorses Barrett Jacks benefits by the universal confidence that is accorded this standard line.

In points of safety, efficiency, service and durability, Barrett Jacks are without equal. There is a Jack especially fitted for every type of car or truck.

Barrett Jack No. 300 shown here is but one of the latest developments in the line of Duff-built jacks. Automatic, geared to raise 1½ tons. The two lifts of different heights, practically combining two jacks, is a feature that appeals particularly to the car owner—and is found on no other geared jack. Weighs but ten pounds.

WE aim especially to give car manufacturers the benefit of our experience in determining the right jacks for equipment, and our sales policy guarantees the dealer entire satisfaction in his handling of the Barrett line. Prompt service on all price and other inquiries.

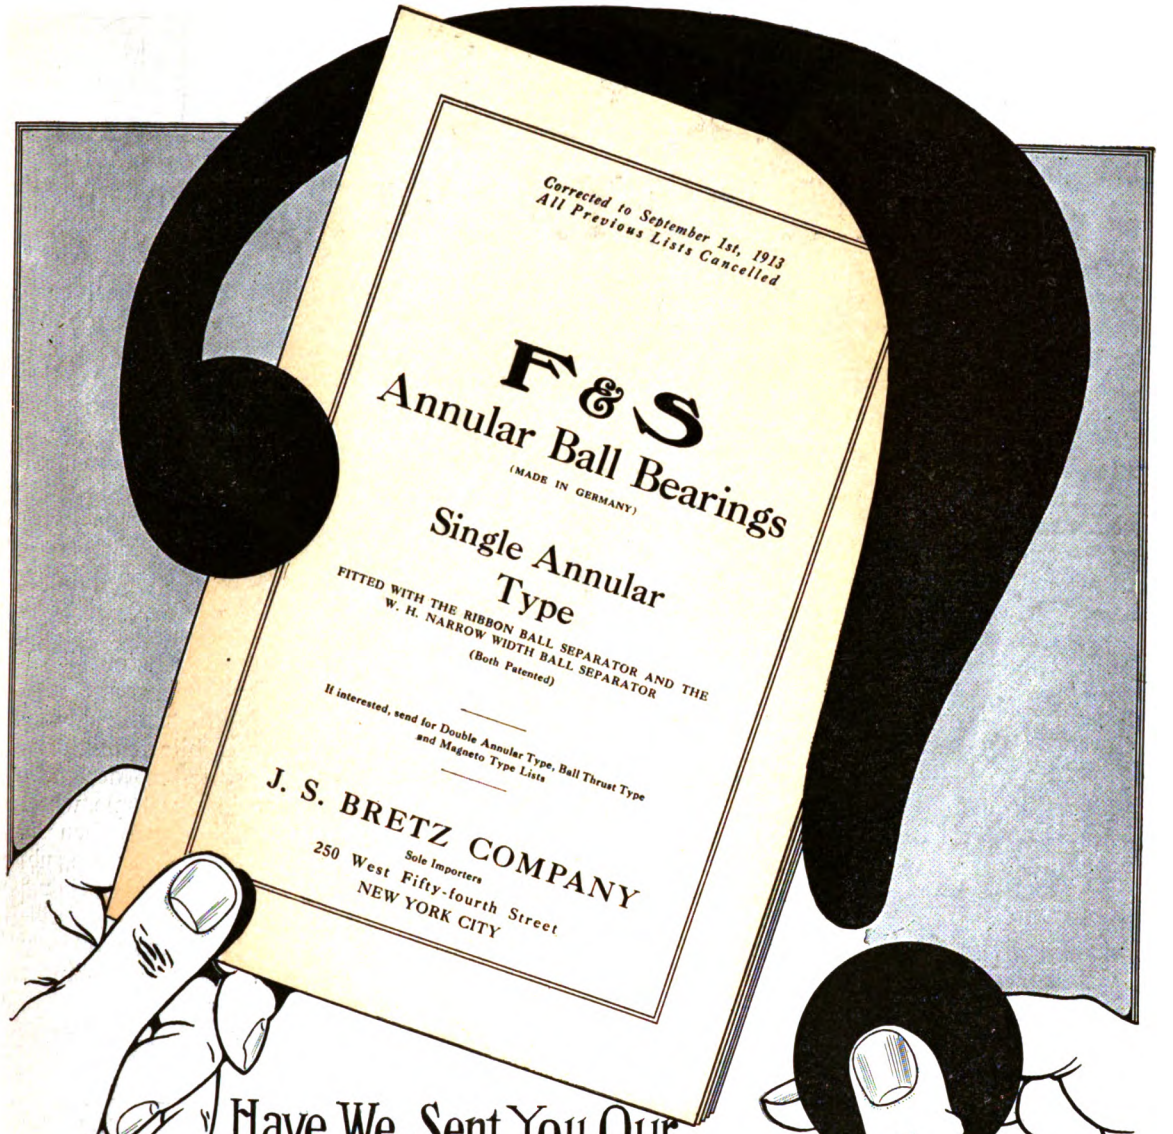
"American" Axles

An Ideal Mounting for That Form of Worm Drive Which Has Been Universally Accorded First Place

In every field of industry there is one acknowledged leader, by which all others of its type are judged.

The Lanchester-Daimler Worm Drive holds this enviable position among gears of its class, because its superior efficiency is not a mere claim, but the verdict of expert engineers, based upon exhaustive practical tests covering many years of service.

Since we secured the sole American rights as axle manufacturers to this gear—some two years ago—we have actually added to the wonderful efficiency which it displayed abroad, through the perfection of mounting which "American" Axles have given it.



By offering manufacturers of high grade gasoline or electric pleasure cars the option of the Lanchester-Daimler Worm Drive, or our own Bevel Drive Axle, we doubled our opportunity for service just when the worm drive became the most important subject connected with automobile construction.

The Lanchester-Daimler Worm Drive, mounted in a full-floating "American" Axle and fitted throughout with the finest of foreign made ball-bearings is, therefore, a unit whose every part has been conclusively tested, and which in its complete form is, we believe, the best axle of its class in the world.

The adjusting and full-floating features of "American" Axles are fully covered by our own patents and by shop rights from other patentees.

CORRECT WIRE

HOUK DETACHABLE

Triple Spoke Lacing

In considering the use of wire wheels remember emphatically that without triple spoke lacing and an absolutely positive automatic locking device all of the strong points of advantage we have been preaching in these columns for months and months fail absolutely to materialize.

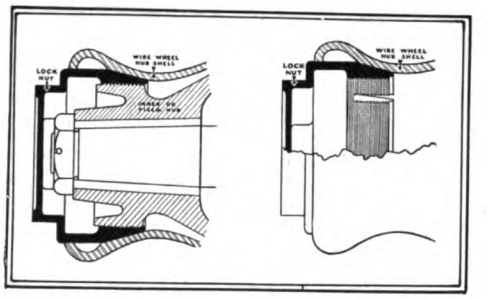
Until our last announcement our campaign of advertising has been confined almost exclusively to discussion of the advantages of wire wheels over wooden wheels. These advantages are so generally known now and so generally accepted that it is our intention to emphasize, for a while at least, the absolute necessity of correct wire wheel design in order to assure the advantages they have shown wire wheels inherently to possess.

Referring to the sketch on this page illustrative of the developments of the triple spoke lacing as explained in exhaustive detail in our four page insert of October 2nd, attention is called again to the fact that in the illustrations A, B and C effort was made to produce a wire wheel with two sets of spokes which would possess the necessary carrying capacity both for radial and thrust loads. But this effort failed because it was impossible to maintain the proper center of tread—as accepted in wooden wheel construction—and at the same time obtain proper angularity of the spokes to resist thrusts from either side and to provide radial carrying capacity. In A not only is the center of the tread wrong but this method does not provide sufficient thrust capacity in either direction. In B and C, the spokes were crossed and offset in an effort to overcome the defects inherent in A without success. Repeated tests showed that while it might be possible to design a statically staple wheel after this manner that when the wheels thus designed were subjected to continued driving, radial load carrying and side thrusts, that a sacrifice of strength in one way or another is absolutely inevitable.

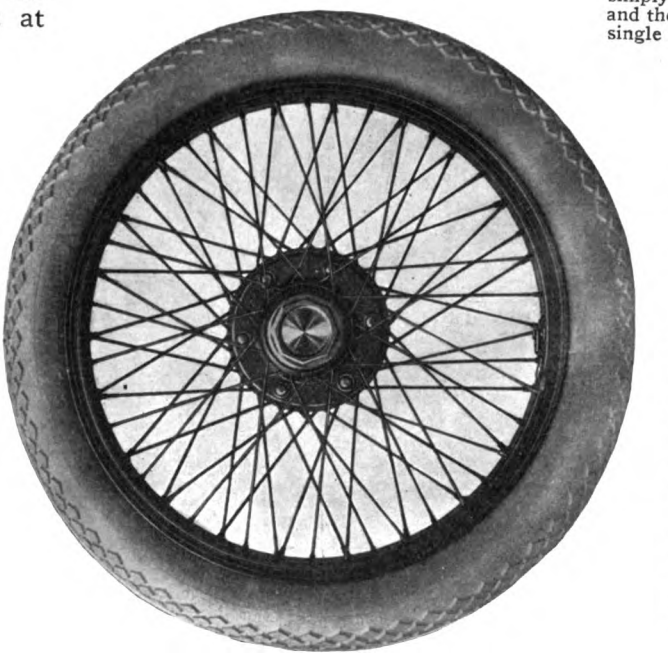
The failure of these methods finally resulted in the perfecting of the triple spoke lacing, as indicated in figure D. In this construction the spokes which are laced at an angle carry the side thrusts, while the circle of spokes which are laced at right angles to the driving line are relieved of all stress due to side thrust and, while carrying their proportion of the radial load, are designed especially to transmit the torsional strains of driving.

This admits of a maintenance of the tread just the same as in the wooden wheel and at the same time gives proper angularity to the thrust carrying spokes to enable the wheel as an assembled unit to possess practically fifteen times the thrust carrying capacity and practically five times the radial and driving capacity of the wooden wheel.

SAFETY *The wire wheel is safer than the wooden wheel. The wooden wheel possesses nothing like the factor of safety applied in every other part of the car. Accidents show that the most severe results have been due to the collapse of the wooden wheel, whether such collapse was the initial or the ultimate cause of these results. Being relatively so much stronger than wooden wheels, wire wheels are the most important protection both to the occupants of the car and to the car itself that can be applied to the modern vehicle. "Safety first."*



Digitized by Google



WHEEL DESIGN

WIRE WHEELS

Automatic Locking Device

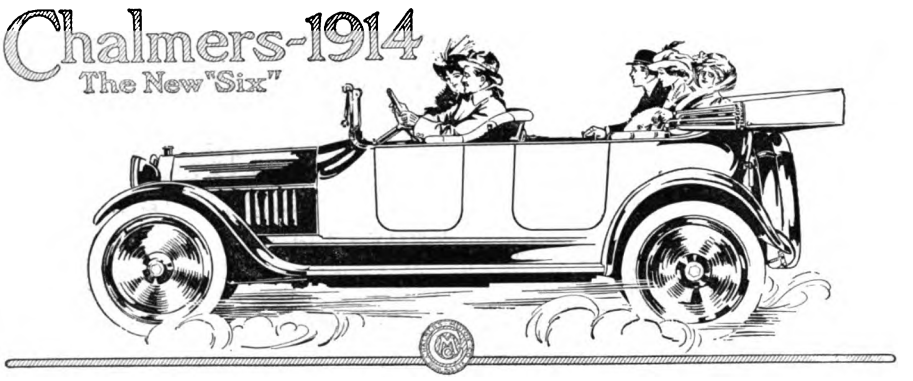
Of equal importance with the proper spoke construction is the question of a positive and absolutely automatic locking device to enable a rapid, easy and certain means of detaching and attaching the wheel to the axle. The value of a detachable wheel because of its lightness in weight at the periphery is so clearly demonstrated, that advance practice of course calls for the discarding of demountable rims and the use of a wheel that is detachable at the hub. This, in turn, makes it absolutely necessary that the locking device must be positive, automatic and simple so as to render the change of wheels easy and quick. There must be no complication or so-called locking device or fixings that depend upon springs, pins or other extra parts which have to be fitted in position.

All such devices are not only complicated and trappy by nature but in the end they depend upon human agency and intelligence to see that they are properly fixed in place every time — and unfortunately under such conditions they very frequently are not properly fixed.

In the Houk Wheel all complicated locking means have been discarded in favor of a positive single piece clamp nut, which is completely automatic and self tightening whenever the car is in motion. As a consequence, by virtue of this maximum of simplicity, the automatic self-tightening and locking device on the Houk Wheel is positively fool proof no matter under what conditions used. In other words, the operation of attaching a Houk Wheel calls simply for slipping it into place and the plain screwing up of this single piece clamp nut. So positive is the operation of this device that even if the operator neglect to tighten this clamp nut the rolling motion of the car itself will finish the tightening process. The illustrations on this page show the application of the locking device to the Houk Wheel.

Reference to the 4-page insert in the October 2nd issue of Motor World will furnish you with the details and scientific facts which prove the perfection of this device.

So let us emphasize the fact again that to insure the comforts and advantages inherent in wire wheel usage care must be taken to specify only those wire wheels which possess these two important features — triple spoke lacing and a positive fool proof locking device.



HOUK MANUFACTURING Co

BUFFALO, NEW YORK

Wire wheels mean a saving of more than 50 per cent. in your tire cost. When you can show a customer that his tire bills are cut almost in two, you interest him in the most important phase of car upkeep today. Then the further facts that wire wheels save the life of the car itself, as well as its fuel consumption---that wire wheels make an easier riding car and a car that is easier to handle, only serve to emphasize the statement that wire wheels are the greatest single sales asset the car of today can offer.

ECONOMY

Digitized by Google

A New Car With a New Motor

Flexible as Steam
Silent as Electricity
Vibrationless as the Turbine

These three things, makers of gasoline motors have sought for years. Some have secured silence, but at the expense of power. Others have obtained smoothness at the cost of efficiency. A few have sought flexibility through supplementary gearing.

You get all three in the new "Six," without sacrifice of power—with no loss of efficiency—without aid of extra gearing.

The Flexibility of Steam

With the new "Six" you can do nearly everything on high gear. You can idle down to a tortoise crawl in a crowd and at the touch of the throttle be off like a thoroughbred without touching the gear lever.

And the motor does it all. The six cylinders draw gas equally from a superheated reservoir. The valves are bigger and open 40% wider than common. They can't hold back the gas as it rushes triple-heated from the carburetor.

This unchecked stream of power is responsive to the slightest touch of the throttle. It gives a flexibility equalled only by the steam engine.

The Smoothness of the Turbine

Vibration means the moving parts of your motor are over-weight or a trifle out of balance.

By using highest grade materials made in a new way, the pistons and connecting rods are made 40% lighter than common. They are balanced on a delicate scale.

The six cylinders of this master motor give a continuous push to the pistons. There's no interval between explosions.

This gives unequalled smoothness and economy. It gives a luxury of motion unsurpassed by the highest priced foreign cars. This is the result of a good six cylinder motor and cannot be obtained in any other way.

Silence that Saves

The noisy wedge-like cams still so widely used have been discarded; in this car big oval cams lift the valves and slide them shut without a sound. So even at high speed, the new "Six" runs with the silence of sailing.

But this silence has a deeper meaning than the bliss of quiet riding. It signifies no friction—no wear—no waste. It means renewal and upkeep costs cut almost to nothing. The new "Six" proves that luxury and economy can go together.

The Chalmers Standard Road Test

We invite you to ride in the new "Six." We want you to feel the ready response of its supple power—the luxury of motion—the charm of its beauty.

In that way only can you really know the merits of this car—the joy of its possession. The Chalmers Standard Road Test is for that purpose. It puts you under no obligation.

Prest-O-Lite

"The reliable light"

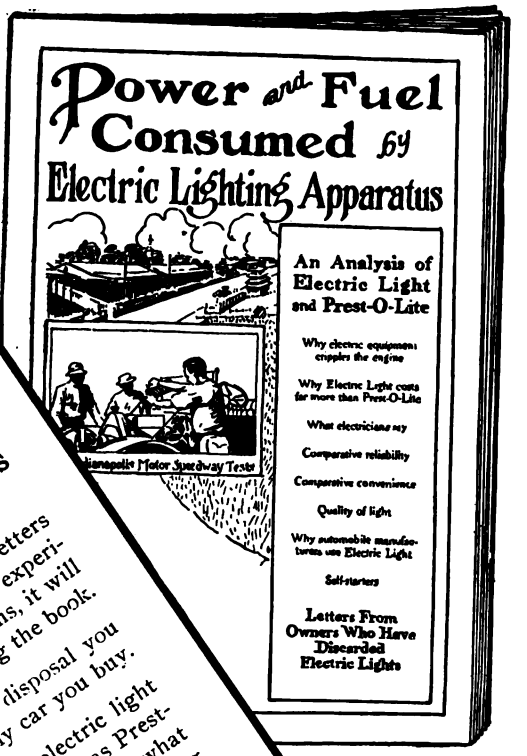
The Real Facts On Lighting

with all the guesswork eliminated.

If you really want to KNOW which is the most reliable, the most economical, and the **most convenient** light—

Send for this book!

It does not merely claim that Prest-O-Lite is the light you want—it **PROVES** it.



If you read nothing else but the letters from owners who have had their experience with electric lighting systems, it will more than repay you for getting the book.

With these facts at your disposal you can get greater value in any car you buy.

If you do not know why electric light costs at least five times as much as Prest-O-Lite, read this book and find out what experience has actually proved among automobile owners, electricians and electrical engineers.

These articles are not written to confuse you. On the other hand, they make the whole subject clear as daylight—easy to read and easy to understand.

This book does not theorize. It is a report of PLAIN FACTS.

Don't Delay

Already the first two hundred thousand edition is practically exhausted. The demand is exceeding every expectation. This fact, backed by the proof of the great, new Prest-O-Lite factory, with output increased four times and working to its full capacity, is an indication that the motorist appreciates reliable light. If you want to get the real truth about automobile lighting —use the coupon.

The Most Efficient of all Starters—

THE Gray & Davis starting motor will crank a car thousands of times in succession. It spins the engine fast enough to fire on the magneto, it is not governed by weather conditions, is extremely powerful and very simple to control. That is why it is the most efficient of ALL starters.

America's leading car manufacturers have adopted this system. It is found on the automobile selling at $1075 and on the car costing $7000. It knows no "price-class" but is to be found on those cars where "price" is disregarded for the sake of getting REAL efficiency.

There is nothing experimental, nothing left to chance. The finest material, the most expert knowledge and years of experience are embodied in the system and show in the results obtained from the use of the system.

Sound electrical engineering practice is absolutely essential if the owner is to get service.

IT is well to remember that the Gray & Davis system represents, down to the smallest details, the very best principles.

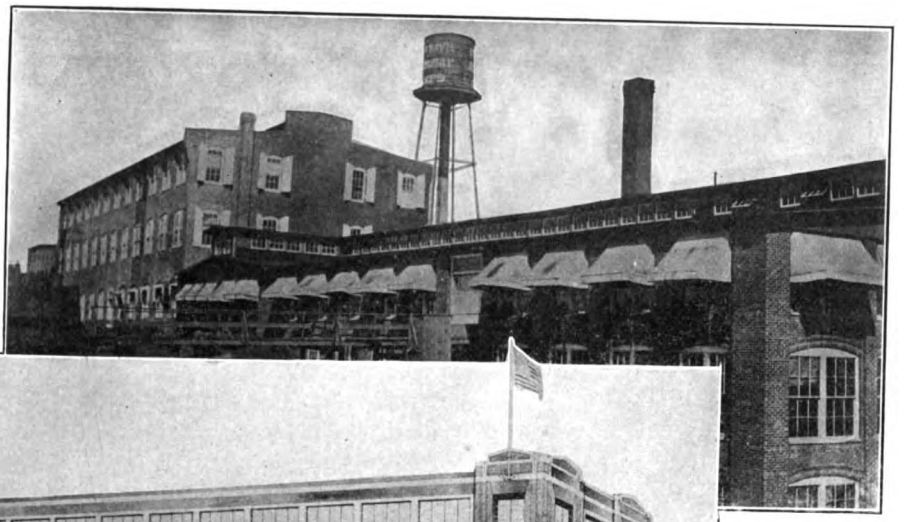
Added to the quality of the system is our corps of service stations, 62 in number, situated throughout the United States for the sole purpose of taking care of Gray & Davis users.

The builder who is sincere in his efforts to make a good car—uses Gray & Davis. In fact, this equipment on any automobile is visual evidence of quality throughout the car.

The Gray & Davis starter is economical in use of current. Perhaps MORE economical than any other system.

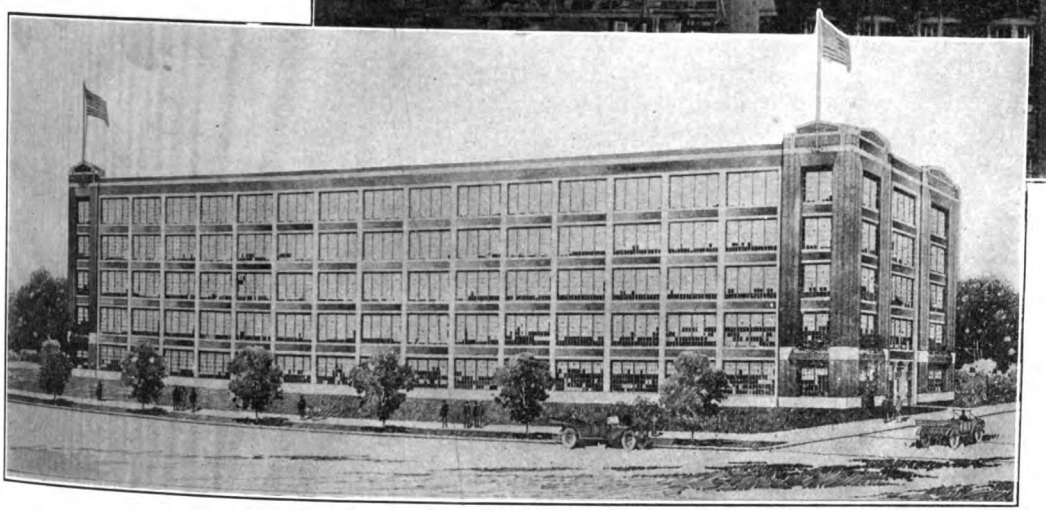
It not only starts the car under all conditions but the dynamo provides the most brilliant light obtainable.

The Gray & Davis system was designed, developed and built by one of America's foremost electrical engineers.



GRAY & DAVIS, Inc.

Digitized by Google



NEXT to efficiency, the car manufacturer demands prompt deliveries. Nothing is so all important as "getting equipment on time," according to contract specifications.

Exceptional facilities are bound to insure the fulfillment of specifications, and what other manufacturer is so well equipped as Gray & Davis to build lamps, dynamos and starting motors?

These Factories Mean Prompt Deliveries —

The Amesbury plant where the lamps are made, now being increased half again its present size.

The new plant in Boston where the dynamos and motors are built.

THE new Gray & Davis factory is the largest plant in the world devoted to the construction of starting-lighting systems.

This magnificent factory contains 140,000 square feet; 70% of the wall area is glass.

Hundreds of trained electricians and machinists work under exceptional conditions building the systems which the motoring public demand.

It is THIS demand that caused us to build the new factory—all of which goes to show that Gray & Davis equipment is preferred by everyone who really knows the great difference in starting-lighting systems.

A Grain of Dust

A sudden gust of wind, a cloud of dust, and a rediculously small speck of dust finds lodgment in one's eye. It causes intolerable pain and inconvenience. Feels like a mountain though it is infinitely small.

The Ellis Gasolene Purifier

Many such grains of dust—or particles of parafine, sediment, etc., find their way into gasolene in spite of every precaution. The prevalence of carburetor trouble gives ample proof that a carburetor is as sensitive to the presence of foreign matter in gasolene as is the eye to a grain of dust.

Sometimes, but not often, just as the eye waters and washes out the offending speck, the carburetor will free itself, but if it doesn't other particles soon collect around the first one and incapacitate it entirely.

Clearly the carburetor is not at fault. The trouble is caused by some foreign substance, some impurity such as dirt, sediment, water or the like. These impurities are things to be eliminated and then there can be no such thing as carburetor trouble.

The Ellis Gasolene Purifier is a patented device designed and marketed with the one idea, that of preventing carburetor trouble by filtering the fuel before it reaches the carburetor. It has been tried in connection with every carburetor made and has always given entire satisfaction. Its filters are impervious to impurities in fuel but do not interfere with the free flow of gasolene to the carburetor. Its gravity method of trapping water out of gasolene is 100% efficient. It is the only remedy for carburetor trouble, a sure insurance against it because it eliminates the cause of such trouble.

Write for full particulars. We will gladly send you letters from prominent users to prove the claims we have made for the Purifier.

TIMKEN

AXLES & BEARINGS

Out For Hard Service

CLANG the gong! Clear the streets! Rush over car tracks! Swing round corners! Take the shortest road no matter how rough! Put on full speed—get to the fire!

Human life is at stake—and property—perhaps the whole town.

Weight on the fire truck is heavy—pumps, hose, ladders and men—and speed is of utmost importance. Nothing can cause delay. The fire truck *must* be dependable. And the foundations of dependability are the axles and their bearings.

Wheel bearings are the buffers that meet the intense shocks, stresses and vibration as the massive engine plunges over rough pavements in its dash to the fire.

They must be better than good bearings, they must be the very best. Bearings that will carry tremendous loads, and in *addition* will meet the severe side-pressure when the heavy engine swings suddenly round a corner.

The Timken Tapered Roller Bearing is the one bearing that meets and withstands *both* these forces. That is why practically all successful builders of fire apparatus have adopted Timken Bearings.

The ponderous weight rests, too, on these bridges of heat-treated steel, the axles.

Head on the Timken-Detroit Front Axle meets every shock and jolt. The gears of the Timken Jack-Shaft transmit the power of the huge engine full force to the chains that drive the rear wheels.

Timken Radius Rods take the tremendous thrust between jack-shaft and rear axle. Their swivel connections enable the plunging vehicle to adjust itself to all unevenness of the road. They supply compensation for every stress from every possible direction.

THE TIMKEN ROLLER BEARING CO., CANTON, OHIO
THE TIMKEN-DETROIT AXLE CO., DETROIT, MICH.

TIMKEN-DETROIT axles are designed for the *extra* stresses that emergencies bring. Builders of trucks which have extra hard duty to perform turn naturally to Timken Axles and Bearings. Their uniform success under the most severe conditions of motor-car service—pleasure and commercial—has been unparalleled.

YOU can learn more of what good bearings and axles mean, of what Timken stands for in good motor-car construction, by writing for the Timken Primers, T-7 "On the Care and Character of Bearings," T-8 "On the Anatomy of Automobile Axles."

Re-Sales the REAL Criterion

If after driving his car a year your customer finds that the car is objectionable on account of the increasing looseness of the bolted construction, will he buy the same make again?

If you, as a manufacturer, expect to sell your customers year after year, it is essential that you pay such close attention to your bolted-up construction as will insure proper tightness for the life of the car.

Don't forget, there are THREE points to a nut lock—

SIZE—ANALYSIS—TREATMENT

Are you sure of them all on your car? Would you like the most recent and most scientific data on the subject? Write—

The American Scout (Type 422) $1550

AMERICAN UNDERSLUNG

THE 1914 American Underslung has that unusual piquant characteristic of refinement.

The American Underslung acts as it looks. It skims. The low center of gravity brings a degree of comfort and safety impossible in any other construction. There is no sidesway. Corners may be turned at a better speed.

The luxury-loving require swiftness without perceptible effort — swiftness and quiet. The American Underslung gives it. Here comfort is more a matter of designing than of springs and cushions. It is built into the car itself. The tonneau passenger invariably underestimates the pace.

The larger wheels of the American Underslung bring greater road clearance and tire economy. The straight line drive delivers more of the motor's power. The motor itself is a marvel of today's engineering.

You can only hope to interest the ultra smart people in your vicinity with a car that has all the qualities of the American Underslung. No other car has them.

If you are equipped to cater to such people, it will pay you to take the matter up with us at once.

"Two Years Ahead"—

This is the opinion of a prominent official of the Ford Motor Company after he had examined carefully the Kelly water-cooled models.

As a result, the Ford Company purchased two three-ton Kellys—making a total of four Kellys now in use at the Detroit plant. These purchases were made after carefully looking over every truck of national repute.

The Dayton Engineering Laboratories Company (Delco) just bought a three-ton Kelly for its Dayton factory.

These companies know the best truck when they see it. Do you?

DEALERS!
There is still some desirable Kelly territory open. Write for our agency proposition.

WORM DRIVE

and a Silent, Powerful, Smooth-Running Mechanism in the

NEW LIPPARD-STEWART; 1½ TON CAPACITY

Chassis Price $2300 F. O. B. Factory

The truck user is today buying motor trucks with a great deal more knowledge of the product than he had a few years ago. He is well posted on construction; he knows modern practice and its bearing on the service the truck will give. It is to meet the demand for just those features which the informed purchaser and the wide awake dealer have been waiting for that the Lippard-Stewart Model F, 1½ ton capacity, is built.

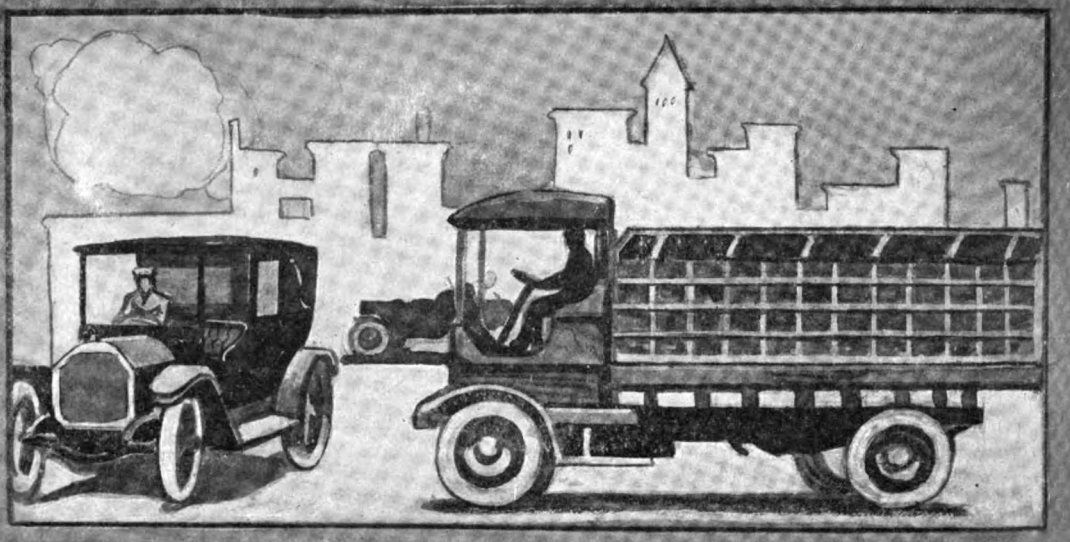
Worm Drive Means Stand-up Ability—Efficiency

With the worm and gear, the quality of service is always maintained at the highest. Engineering tests have proved that Lippard-Stewart worm drive utilizes more actual pulling effort than any other drive system. Wear is practically negligible when compared with that occurring when jack shaft and chains or bevel gears are used. After years of service, the worm drive does its work with the same efficiency as when it was new. Power is applied smoothly—without jolt or jar—without a sound. For these reasons—reasons that no other type of drive will warrant—the Lippard-Stewart rear axle demonstrates its value as a money saver.

Lippard-Stewart Model F's rear axle is of Timken make and is equipped with the famous David Brown worm and gear. It is the product of English and American designers who have specialized for years on axles and worm drive. Its adaptability to truck work makes other rear systems back numbers. It sets a standard for trucks of its capacity. The dealer who sells, or the firm which uses the Lippard-Stewart Model F has a trade advantage by virtue of the truck's up-to-dateness.

These Features Back Up the Advantages of Worm Drive

Lippard-Stewart Model F is an example of balanced construction. The truck's high quality is maintained from end to end. 35 H.P. developed by the Continental motor; automatic governor for speed control; cone clutch and Brown-Lipe transmission with capacity greater than motor rating; straight line shaft drive; frame with the reserve strength to withstand the hardest strains; perfect cooling by a built-up tubular radiator; wheelbase 145″ or 158″; solid tires, 36″ x 3½″ front, 36″ x 3″ dual rear; ease and safety of control; accessibility and simplicity—these features round out a truck that, for its capacity, is the leader in the commercial car market.



Dealers:

Your knowledge of all that's good in motor trucks will tell you how Lippard-Stewart Model F conforms to what your trade wants. You know how the Lippard-Stewart 1,500 pound delivery car has built up a reputation for satisfactory service. These two models, the complete line, will bring to your salesroom the majority of prospective commercial car business. And the way they measure up to requirements, and their logical prices, mean orders—not simply inquiries. Our proposition holds out money-making possibilities for YOU. Write for it now and ask for descriptive literature. Your territory may yet be unassigned.

JACK SHAFT BRAKES WON'T DO *in* NEW YORK

In the taxi cab service of New York City practically every jack-shaft brake has been discarded for both brakes on the rear wheels.

What is perhaps the heaviest and strongest one-piece rear axle made in America for pleasure cars is frequently broken in taxis, altho never in pleasure cars.

In London, also, the Scotland Yard authorities insist that all motor busses and public service vehicles be equipped with brakes fitted to the rear wheels.

Frequent starting—stopping in the densest traffic—skidding around corners—*safety depends upon the brakes.*

Sheldon Double Brake Rear Wheel Equipment

delivers all the power where the power is needed—and delivers it effectively. It affords unusual freedom from chain, jack-shaft and axle strain and bending. It is the only logical design to stand abnormal shocks because it involves a minimum number of parts subjected to strain.

Consider the enormous reversible strain coming from the rear wheels when the jack-shaft brake is locked! Of course, you can make the parts heavier to withstand the strain—but why add all this unnecessary weight? Then, too, every unit between the brake and the road wheel is an uncertainty which tends to decrease the braking efficiency of the truck. Such construction endangers both the truck and the public.

If YOU are interested in this all-important question of efficient braking, let us send you complete information. Write us today.

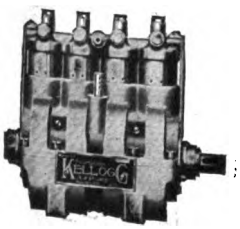
Manufacturers, Dealers and Car Owners, READ THIS

"Possibly three-fourths of the tires returned to the manufacturers for repairs have been ridden insufficiently inflated. Insufficient inflation is responsible to a greater extent than perhaps anything else for blowouts and quick disintegration" By F A Henderson, manager adjusting department of Goodyear Tire and Rubber Co.

Tires Are Always Properly Inflated When You Have the



Four Cylinder KELLOGG Tire Pump

All you have to do then is to simply attach the hose from pump to your tire, and shut it off when the gauge registers proper pressure.

No hand pump—with its ever present back-breaking, loss of time and temper—is conducive to proper inflation. Human nature is the reason for its failure.

There's only one sure and safe way—

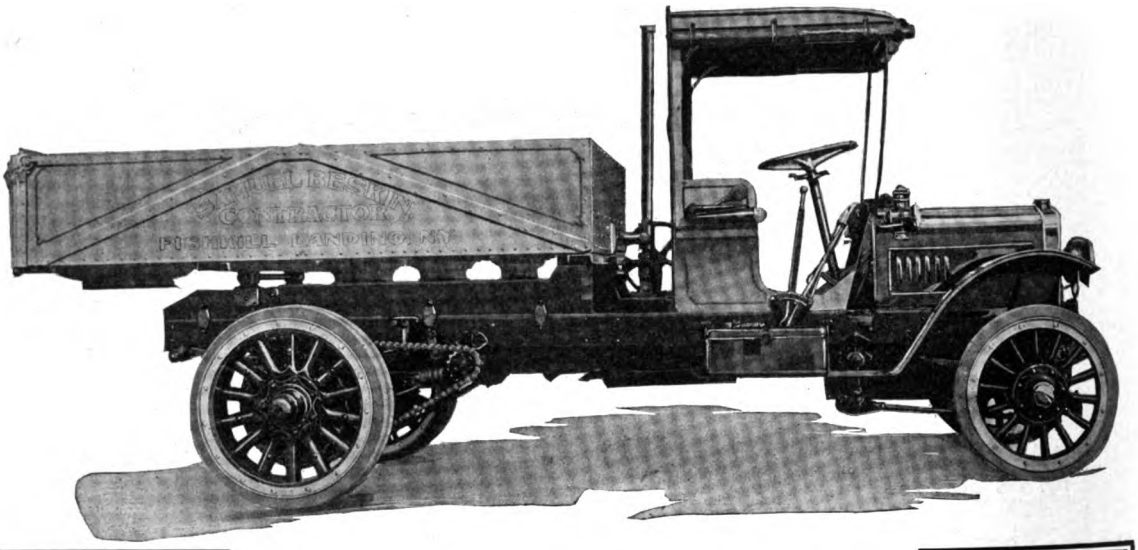
The Standard Kellogg 4-Cylinder Tire Pump

Standard because it has been used solely for years by the makers of better cars. These makers include Packard, Peerless, Winton, Stevens-Duryea, Lozier, Stearns, Palmer-Singer, Chalmers, Stoddard-Dayton and many others.

No other tire pump can boast our record. No other can equal our efficiency. No other can match our advantages.

Attachments are supplied for installing the Kellogg in practically any model of any car now in use or announced for 1914.

Manufacturers and dealers should investigate at once—for their own profit. Send for our book—"Air On Tap."



Kellogg Manufacturing Company, Main and Circle Streets, Rochester, N. Y.

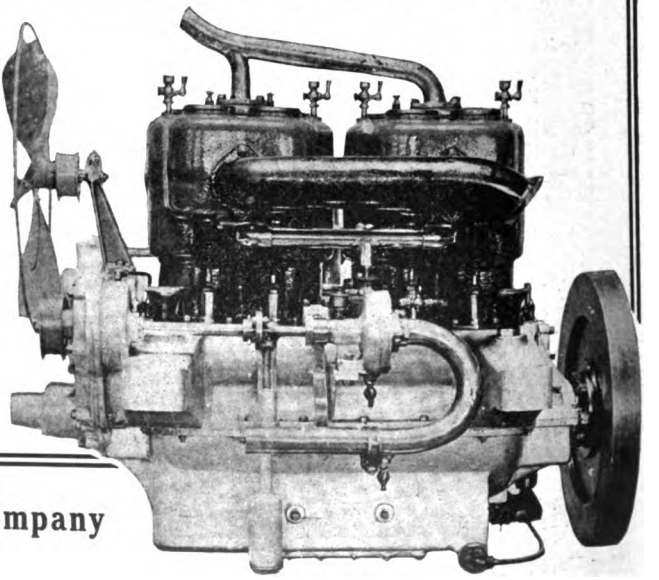
THE ATTERBURY LINE



AT least eight or nine years ago we saw the efficiency idea begin to affect the truck business. It began to affect selling first, and its effect on the sale of trucks made it felt in the factory almost immediately. Possibly the selling and advertising branches of the truck industry realized the importance of efficient truck service as a selling help, more to be desired than any other qualification, but nobody, either manufacturer or buyer, realized the importance of developing a construction that would provide efficiency more than we did at the Atterbury Shops.

Our idea of efficiency was broad and farsighted, as events go to prove. We did not increase the pulling power of our motors without we met the extra power with a hitch-up and rear-end to correspond.

We have been working on this efficiency plan for nearly ten years, and we started out with more than the ordinary efficiency as the fact that many of the first Atterbury Trucks built are still in service and giving good results, will testify.

We show here a picture of our standard motor for the three-ton capacity Atterbury. This is the power plant that our experience has determined to be best adapted to the requirements of this particular truck. We would like to go into the details of Atterbury construction with you if you are interested in the truck sales business, and go over with you every point in their make-up, showing you how Atterbury efficiency has been developed and why you can offer your customers one of the greatest pieces of transportation machinery that ever went into anybody's hauling service.

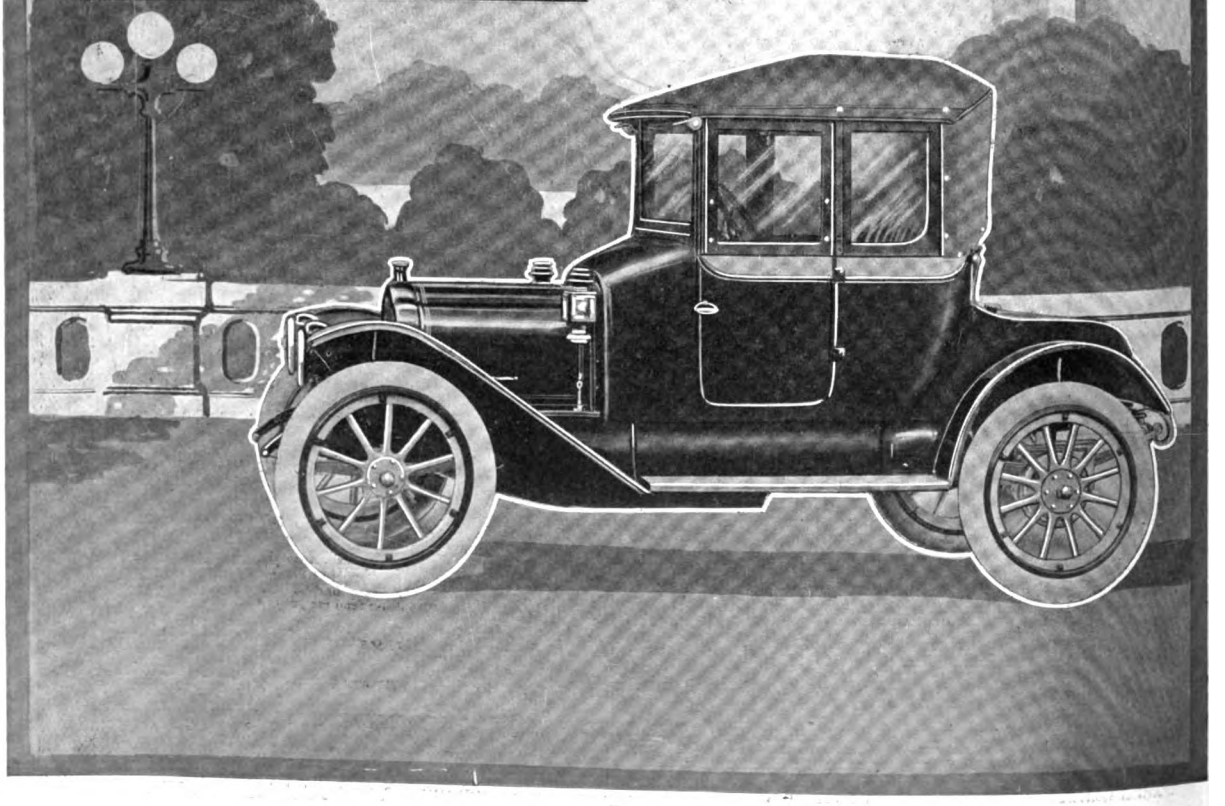
SPRINGFIELD
CONVERTIBLE BODIES

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.



The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.

The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.

Write for brochure of reproduced photographs.

Rushmore Electric Lighter and Starter

Regal

Left Hand Drive—Center Control

Model "T"—5 Passenger Underslung Touring Car—$1125

Scientific Care of Every Detail— Secret of *Regal Quality*

THE New Series of Regal Cars has increased our reputation as builders of automobiles of quality. This fact is now recognized by dealers and consumers the world over.

And the secret of Regal Quality is—*scientific and conscientious care in the construction of every single detail.* Thus, perfect details result in pefect Regal Cars—automobiles of utmost efficiency, long-life, power, beauty and economy.

The new Regal Cars are *finished products*—complete in every detail of mechanical construction and body beauty. They actually *look like* cars costing $2000 or more because of their refinement features and external appearance.

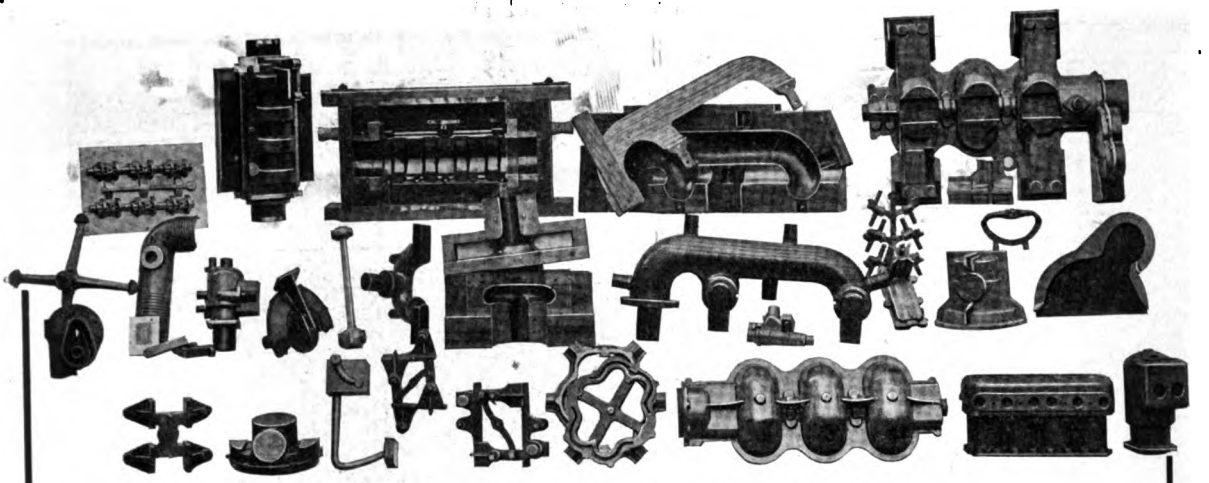
Every desirable advancement is found in these new cars. No more motor car value can be purchased anywhere this year for such prices.

Values Offered You—

We have incorporated the efficient and positive Rushmore Electric Starter and Lighter as standard equipment on all Regal Cars. The desired left hand drive and center control have been adopted. Other features of our standard equipment are: Electric headlights, with dimming attachment. Long, low, sweeping body lines with cowl dash. Starter, lighting and speedometer switches on instrument board. Special adjustable curtains. Rain vision and ventilating windshield. Demountable rims. Tire irons. Foot throttle and muffler cut out.

The New Series—

Our New Series includes Model "T", a large and beautiful 5-Passenger, underslung, touring Car at $1125—Model "N," an efficient, speedy, underslung roadster, $1125—Model "NC," an elegantly finished and appointed, underslung coupe selling at $1600 and Model "C," a big, powerful, 5-passenger overhung car for $1350. The underslung values of extreme safety, economy and beauty are developed to the highest point in our Underslung Models.



Dealers—Write Today

We desire wide-awake, aggressive dealers in certain territory still open. You may be just the right man. We give our dealers excellent co-operation and unusual factory service. Write or wire us for our New Series Literature, *with complete specifications and prices*, and our attractive dealers' proposition.

Literature sent to prospective purchasers on request.

COX OXYGEN CARBON CLEANER

New
Thorough
Quick
Inexpensive
Harmless
Efficient
Necessary
Profitable

The first really efficient and thorough method of cleaning carbon out of the cylinders is the new Cox Oxygen Carbon Cleaner. It consumes every particle of carbon, even in corners where it could never be scraped out, without the slightest possibility of harming the cylinders.

It takes from 6 to 10 minutes to clean each cylinder, averaging 30 minutes for a four-cylinder motor and 45 minutes for a six. Any workman can do it. Does not require experience or expertness. Absolutely safe to handle.

For Public Garages

The profit possibilities for you in the Cox Oxygen Carbon Cleaner are only limited by the number of your customers. You do the work in one-tenth the time and only a fraction of the cost of any other method. Motorists will pay you well to clean their cars regularly. It is just as necessary as washing the car. This new method will quickly establish the custom of regular cleaning.

For Large Private Garages

For private garages in which more than one or two cars are kept, the Cox Oxygen Cleaner is a good investment. It pays for itself in the greater economy and improved running of the car.

Write Us Today

and we will prove that your profit per cylinder is almost gross—that you can actually pay for the carbon remover several times over inside of a week—this has been done.

Get the information—read the detailed facts—learn still more about the integrity and responsibility back of the house that guarantees every claim made for this—the only REAL carbon cleaner.

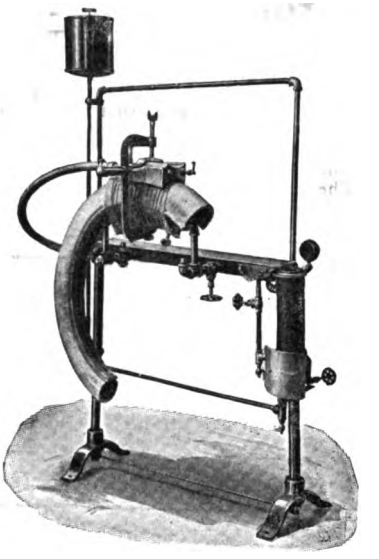
Blow-out repairs that outlast the tire

The only way to make durable blow-out repairs economically is to reinforce the tire with fabric applied to the inside, fill the hole through the tire with Para gum, then apply heat both to the inside and outside. This method avoids cutting away and wasting a lot of expensive tread stock, requires a minimum of fabric and makes a repair that is stronger than the tire. Anyone can use it because the work is all straightforward, requiring no special experience. One set of forms fits all sizes of tires. No extra moulds required.

SHALER Steam Vulcanizer

The Shaler is the only steam vulcanizer that permits using the approved wrapped tread method as it is the only one that applies heat to the inside and outside of a tire simultaneously. It makes perfect blow-out repairs.



To make it complete as a garage equipment it is provided with a tube plate 4 x 30 inches that will mend six tubes as quickly as one.

The boiler, a conical copper coil, heated by a powerful gas or gasoline burner, raises steam so quickly that you can profitably heat the Shaler even if you only have a tube puncture to mend.

The essential Shaler feature of a thermostat to hold the temperature at the vulcanizing degree automatically makes it impossible to overheat a tire. Simply light the burner, and steam is raised to the correct pressure and held there indefinitely.

Price of the complete outfit, including all attachments for tube and casing work, $45.

C. A. SHALER CO., 431 Fourth St., Waupun, Wis.

Free—a tire handbook for repairmen

Write today on your letterhead for a copy of "Common Sense About Tire Repairs." It contains a lot of money-making ideas about the most profitable part of the repair business.

Notice to Customers Who Desire to Use "Whitney" Chains of the Silent Type

Copy of Circular Issued May 14, 1913

Since we commenced to market chains of the Silent type, we have made special effort to impress upon our customers the necessity for providing proper conditions for both chains and sprockets. We have pointed out that sprocket blanks must be turned to the right shape and that the teeth must be correctly cut. Sprockets should not have less than 15 teeth, should be larger if possible, and should be kept accurately in line. We have also urged on our csutomers the importance of selecting chains wide enough and large enough for their purpose and we have asked that in all cases customers make a thorough and exhaustive test before ordering in quantities to make sure that all conditions have been properly provided for. As a means to this end we have requested that the sprocket teeth be cut either by the customer or by The Whitney Mfg. Co. and not by some third party. In spite of these warnings we now find cases where our chains may fail to give complete satisfaction because some customers are already using them on improper sprockets, or have adopted chains too small in pitch or too narrow for their conditions.

We therefore desire to state that customers who do not follow our suggestion, but on the contrary secure sprockets wherever they please and possibly where they can secure the lowest price, are liable to obtain incorrect sprockets, so that at any moment we may feel compelled in such cases to discontinue shipments of chain, or insist that sprockets be sent to us for inspection at the customers' expense, before furnishing chain.

We will endeavor to force customers to use our chains on correct sprockets and to use chains of a sufficient size for the purpose even if we get certain customers into temporary difficulty. The ultimate result, however, we believe will be beneficial to all.

If a customer will explain the conditions for which our Silent chain is desired, we will be pleased to recommend a size of chain for trial, but, as stated above, we advise that chains shall not be purchased in quantity until a severe test has been made and the results found satisfactory.

In the early days of the Bicycle industry and when Roller chains were first used for the main drive on automobiles, certain customers used our chains on incorrect sprockets and we shielded them in every way possible, letting the chain take the blame for unsatisfactory results. With the Silent chain we will positively not follow this plan, and if customers adopt chains without making proper tests, and use them on poor sprockets, or under unfavorable conditions, they must take the consequences, for we certainly shall accept no responsibility in the matter, though such customers would, of course, have our sympathy and we would do our best to render assistance.

We must positively maintain our position, as outlined above, as we do not intend that our chains shall be unjustly condemned if we can help it.

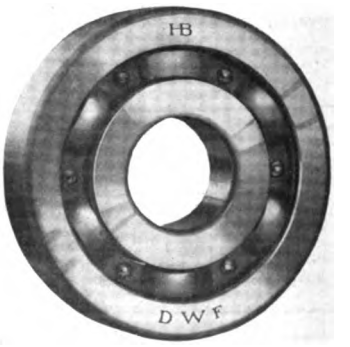
HESS-BRIGHT

MOTOR CARS which have achieved enviable reputations for excellence in design, construction and performance invariably employ Hess-Bright Ball Bearings.



¶ However vigorous the claims of various ball bearing manufacturers as to the relative merits of their products, the fact that engineers, whose choice of bearings is based on QUALITY, prefer Hess-Bright Ball Bearings, is the sound and practical answer to the automobile trade.

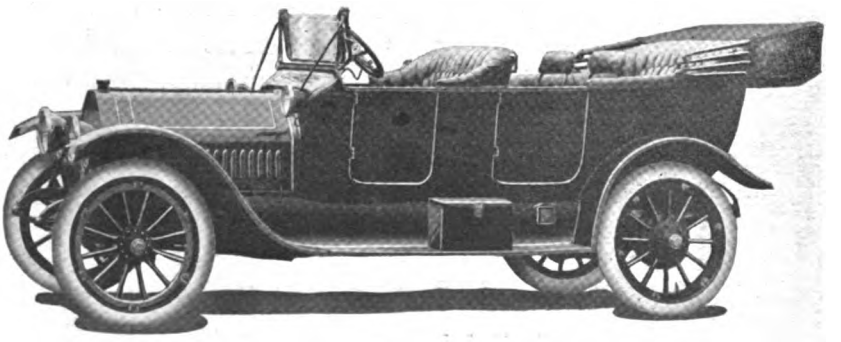
Studebaker

Studebaker cars are more than merely good cars.

They are symbols of manufacturing integrity; and of great manufacturing resources.



They stand as the realization of the Studebaker ideal—which may be summed up as the sincere desire to give the greatest possible value that can be given for a stated sum.

They represent the Studebaker spirit—which binds the dealer afield to the factory; and the owner to the dealer, through a service that never relaxes its vigilance or its earnest purpose to satisfy every owner.

Buyers' confidence in Studebaker integrity, sincerity and service is what impels dealers to seek the Studebaker representation.

The Electric Double Deck Disco

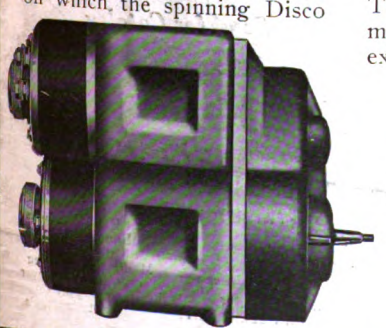
All Starters, Finally Must SPIN Like This

150 R. P. M.

—that is the speed of the Electric Disco every time you push the button.

And that **spinning** will start **any car** in a very few turns-over. The motor may stand idle for hours in the coldest weather. But it cannot fail to answer the Disco.

The first one or two turns are slow so there is no jar on the engine.



This is the necessary starter —especially in winter.

For most so-called starters are merely "crankers." They simply "churn" the motor. The Disco **spins** it, as men spin theirs by hand when those "crankers" fail to work.

Watch the Cars Coming Out

Watch the cars coming out on which the spinning Disco has replaced the churning starters. Thousands of motorists have had experience. They know starters now must **spin.** They don't want to and won't wait for slow starters. They know that slow starters often fail absolutely during the winter months.

Sooner or later all starters must spin, for men, who know, will have no other kind.

A Small Extra Cost But ONE-POINT Connection Saves It

The Electric Disco, the wanted spinner, costs more to make and to buy than the churners but the cost to install is less because one connection, done with less time and trouble, is all that is necessary. That saves enough money for manufacturers to pay the small extra purchase cost.

Simple, Compact, Uses LESS CURRENT

There is no simpler starter. This Double-Deck two-unit construction is compact as a motor generator.

And though making 150 R. P. M., it uses less current than churning starters, because it starts every motor quicker. We may use more current per second but we require fewer seconds to start.

That means a full charge in the battery always. Six Disco-equipped cars were tested after each had run 25,000 miles. Every battery finished charged to capacity, and in absolutely perfect condition.

That's because the Electric Disco starts INSTANTLY. And every man who wants a starter wants one to do that.

An Interesting Book

will be sent free to manufacturers, motorists and dealers, fully describing the Electric Disco, and the double-deck design. It also deals with starters in general. It will profit all motor car men to read it.

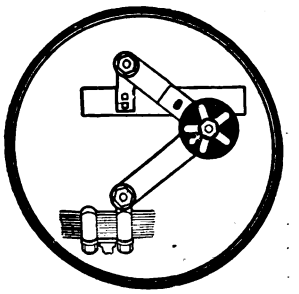
The New Automatic Truffault-Hartford Shock Absorber Provides Even Riding on All Roads



In view of the radical variation in road conditions today, more than ordinary importance is attached to the introduction of the New Automatic Truffault-Hartford Shock Absorber. This latest development in shock absorbers paves the way to easy riding on all roads—in effect, creating the impression of motoring on one continuous stretch of boulevard.

Passing from one kind of road to another has always been attended by an easily perceptible difference in the riding action of the car.

With the perfection of this new type of Truffault-Hartford, the amount of control exerted depends entirely on the character of the roadbeds over which the car is traveling.

On smooth roads the New Automatic offers sufficient resistance to eliminate the slight but noticeable spring oscillation there generated, but without impairing the flexibility of the spring.

The amount of frictional resistance is automatically doubled, however, as soon as the road changes from smooth to moderately rough and the normal action of the spring is so perfectly maintained that the occupants of the car are unaware that the road surface is altered in any way.

There is a third and still greater degree of tension exerted by the New Automatic which is effective in two ways. It preserves ease of riding on even the roughest road and prevents excessive spring deflection and rebound when the wheels of the car strike some road obstruction such as a cross walk, car track or culvert.

All three tensions are self-regulating and self-adjusting and easily set to the proper degree for every kind of automobile spring from the thin leaved, highly flexible type to the heavy thick-set type.

No other shock absorber built can compare in efficiency of operation with the

New Automatic

Truffault-Hartford

SHOCK ABSORBER

It is the logical spring control guaranteeing the greatest ease of riding and adding materially to the mileage of tires and to the life of every car part. Price $60 per set of four. Other Truffault-Hartfords $50, $40, $25 and $15. Order by name from your dealer or from any branch.

R·I·V Ball Bearings

IMPORTED
Since 1904

Quality

R. I. V. CO.
1771 B'way, N. Y.

A Valuable Introduction

R. I. V. Imported Ball Bearings are a valuable introduction of any product. Their adoption means on the part of the maker a recognition of the fact that "The Best Is Cheapest In the End."

Manufacturers and Dealers alike want in their cars bearings that will help sell them—smooth-running, durable, economical, efficient bearings—for upon bearing efficiency depends the satisfactory and quiet operation of any car, gasolene or electric.

There is an R. I. V. for every need and no high-class maker can afford to omit them.

Vol. XXXVII New York, U. S. A., Thursday, October 23, 1913 No. 5

JEFFERY, TOO, DECIDES TO DISPOSE OF ITS BRANCHES

Turns Chicago, Milwaukee and San Francisco Branches Over to Dealership Concerns—Arranging to Sell Remaining Three.

Apparently branch houses of automobile manufacturers soon will be few and far between. During the past several months the Studebaker, Franklin and Lozier companies, among others, have discontinued all of their branches and now the Thomas B. Jeffery Co., of Kenosha, Wis., is doing likewise, three of its six branch houses already having been turned over to local interests—those in Chicago, Milwaukee and San Francisco.

The San Francisco house, which until January last was managed by Louis H. Bill, who is now general manager of the parent company, has been conveyed to the Jeffery Auto Sales Co., which will control the distribution of the Rambler, or Jeffery car, as it is hereafter to be called, for all of the Pacific Coast States. The personnel of the new San Francisco company, however, has not yet been disclosed.

The Chicago branch has been turned over to the Centaur Motor Co. of Illinois, of which A. M. Robbins is manager. It is stated that this deal was consummated some time ago, but for some reason the news was not permitted to become public property until this week.

In Milwaukee, the Reeke-Osmond Motor Car Co. has taken over the Jeffery establishment and will control the State of Wisconsin and the northern peninsula of Michigan. The new company is composed of Al Reeke and N. E. Osmond, who previously were manager and head salesman, respectively, of the Jeffery branch, and Henry M. Vogel. The latter is secretary-treasurer, Reeke being president and Osmond vice-president.

Deals also are pending in New York, Philadelphia and Boston whereby those branches also will be turned over to local interests.

New Men to Make Feps Carburetter.

Because, it is stated, the money did not come in fast enough, the Schoen-Jackson Co., of Media, Pa., has literally abandoned the Feps carburetter but, despite the fact, its manufacture will be taken up and continued by the men who have had to do with it since its beginning, chiefly J. Fritz, the inventor, and J. H. Oman, of the Oman & Bub Advertising Agency. They were the men who interested Messrs. Schoen and Jackson, former owners of the Pressed Steel Car Co., in the device, and though the Schoen-Jackson withdrawal will cause a short temporary halt, Fritz and Oman already are in touch with another company which they are sanguine will take up the work where Schoen-Jackson left off.

The Feps carburetter is one of the most ingenious of the many which recently have made their appearance and attracted a surprising amount of attention, but, despite the great promise, its financial sponsors apparently were not possessed of the patience to await the ripening of the harvest.

Reo to Distribute 60,000 Truck Shares.

Sixty thousand shares of the Reo Motor Truck Co.'s stock, par value $600,000, held by the Reo Motor Car Co., of Lansing, Mich., are to be distributed to the stock holders of the latter. As their names suggest, the two companies are intimately related, but the cutting of a melon in exactly this form had not been generally anticipated. It followed the declaration of a 7 per cent. dividend on the Truck stock.

More American Starters for Foreign Cars.

More evidence that interest in engine starters is increasing abroad is evidenced by the placing of a considerable order for Gray & Davis lighting and starting outfits by Arrel-Johnston, Ltd., of Paisley, Scotland. The company is among the best known of the British car makers.

ON RAGGED EDGE FOR THREE MONTHS, INTER-STATE FALLS

Admits Insolvency and Liabilities of Half Million—Internal Dissension Aids Downward Course—Paid Debts With Its Overstock.

After swaying to and fro for all of three months, the Inter-State Automobile Co., of Muncie, Ind., on Friday last, 17th inst., was placed in the hands of a receiver—M. J. Broderick, president of a boiler company bearing his name.

The action was taken on the petition of Thomas F. Hart, president of the Inter-State company, who admits that it has liabilities of $500,000, which it is unable to pay, and is insolvent. Hart's petition also makes public, what was not generally known, that internal dissension had racked the company for a considerable period, and to this fact he attributes its inability to obtain money when it was needed.

Its liabilities of approximately $500,000 do not include its outstanding capital stock, amounting to $195,000 common and $100,000 preferred.

The failure of the company has been so long foreshadowed that the appointment of a receiver will be accepted almost as a matter of course. Quite apart from internal quarrels and inability to borrow money, the company had an overstock of cars and for three months it has postponed the evil day by inducing many of its creditors to accept cars in payment of their respective claims.

The Inter-State company was organized largely through the efforts of Dave W. Henry, who "graduated" from the old Electric Vehicle Co., of Hartford, Conn., and was, in fact, his first promotion. After he was ousted, he organized successively three other automobile manufacturing companies in the West, all of which, however, were quickly overtaken by misfortune of one sort or another.

PALMER'S OWN FINANCING RIVALS MICHIGAN FIGURES

Financial Genius of Buggy Company Owes $1,656,228.70 and Has $103.28 in Cash—Further Revelations of Bankrupt's "Rottenness."

If the Michigan Buggy Co., of Kalamazoo, made a picturesque failure, what must be said of Victor L. Palmer, its secretary and financial genius?

When the probe first reached the rottenness of the company, three of Palmer's creditors, as stated in Motor World, deemed it wise to file a petition in bankruptcy against him, but it was not until Thursday last, 16th inst., when he filed his schedules in bankruptcy, that the real picturesqueness of Palmer's personal failure became apparent; they proved that whatever else may be said of him he was no "piker." The schedules showed liabilities of $1,656,228.70 and assets amounting to but $21,122.28. The assets were made up as follows: Stocks and bonds, $20,000; wearing apparel, $120; cash on hand, $103.28; household goods, $120; other property, $779. His liabilities were made up chiefly of notes held by 18 banks, scattered from Wall street to the Rocky Mountains. Of the worthless paper, one Chicago bank alone holds more than $100,000. Kalamazoo's profound amazement that one man could obtain such credit in so many banks will be shared by the automobile trade.

Palmer's schedules were filed at almost the last hour allowed by law. Before he filed them he had spent two hours on the stand as a witness in the trustee's investigation of the company's affairs. Among other things, he was asked pointed questions concerning his knowledge of a Kalamazoo club, with a roulette wheel attachment, of which, it was intimated, he had guaranteed at least part of the rent and at which the company's customers were entertained.

When asked whether he ever took any of his stenographers to the establishment, he expressed doubt, but remarked he "often took the girls riding."

The investigation brought out that before its failure Palmer had sold all save one share of his stock in the Buggy company, and also threw some light on the so-called "velvet" payroll which was charged to J. Roache & Co. for advertising and carried as a company asset.

According to the testimony, it appears that nine men shared the "velvet" during the 12 months ending July 1st last. George B. Lay, Sr., received $12,000, Palmer $14,083.07, George B. Lay, Jr., and Frank Lay, each $18,783.31, George A. Dougherty $2,816.58, W. H. Cameron $1,035, Thomas Grant $1,049.98, J. C. Wilson $300 and James Reynolds $100, a total of $68,946.45.

Palmer explained the "velvet" payroll by saying that as the two Lay brothers took great interest in the business it was thought that they should be rewarded.

Palmer declared that everyone in the company knew that dealers' notes were being floated on the banks throughout the country and explained how they were negotiated. He admitted, however, he did not know how many notes were outstanding.

He also professed surprise that the account of E. F. Gerber, of Pittsburgh, had been permitted to run up to more than $300,000. He maintained that he did not know whether or not George Lay was a director in Gerber's company.

Palmer acknowledged that he compiled a statement as of June 30, 1913, showing the company's total assets to be $2,689,053 and liabilities $881,441, but maintained that he obtained the figures from department heads. Palmer also acknowledged that he borrowed money on the strength of that statement, although, two months later, it was shown that the liabilities amounted to more than $3,000,000.

It also was brought out that a Michigan car had been given to the Mayor of Kalamazoo, but for exactly what reason is not made clear, Palmer stating that it was understood that the gift had been as compensation for some services the mayor had rendered.

When George B. Lay, Jr., was called as a witness he failed to appear, despite several days' effort to locate him. His brother explained that the referee had given George permission to leave Kalamazoo to seek work, but the prober's inquiry brought out that George had sought the work in Lexington, Ky., where the Grand Circuit trotting races are being held, and intimated that he went there to "play the ponies."

Michigan Personal Property Disposed Of.

In the United States Court in Grand Rapids on Tuesday last, 21st inst., Judge Sessions confirmed the bid of Samuel L. Winternitz & Co., of Chicago, for the tangible personal property of the bankrupt Michigan Buggy Co., of Kalamazoo.

According to the terms of the bid, the Chicago firm guarantees creditors $225,000 from the auction sale it will conduct, from which it will deduct a commission of 12½ per cent. The property to be disposed of does not include real estate or plant.

E. F. Gerber, the Pittsburgh agent for the Michigan car, made another attempt to acquire the plant in Kalamazoo, this time offering $225,000 for the personal property and $40,000 for the real estate, but, like all his previous bids, the offer was refused.

STANDARD ROLLER BEARING FINANCIALLY EMBARRASSED

Unable to Meet Obligations, Big Philadelphia Company Goes Into Receivership—Action Taken to Conserve the Assets.

Inability to pay the interest or principal on its floating indebtedness, coupled with the refusal of a New York bank to renew a maturing loan, and the threatening attitude of other creditors, caused the Standard Roller Bearing Co., of Philadelphia, to be placed in the hands of receivers yesterday, 22nd inst.

Action was taken by the First National Bank of Philadelphia, a creditor to the extent of $3,000. Judge Thompson, in the United States District Court in Philadelphia, named Robert S. Woodward, Jr., president of the company, S. Laurence Bodine and Thomas L. Gaskill as the receivers, under a bond of $160,000.

Judge Thompson's action followed similar procedure in the Federal court in Camden, N. J., the previous day, the company being a New Jersey corporation capitalized at $10,000,000.

According to the bill of complaint, the assets of the Standard company are in excess of its liabilities and if properly conserved under receivership proceedings the creditors will be paid in full and a substantial residue be left for the stockholders.

The receivers, of course, will continue to operate the plant, and it is promised that there will be no interference with the production of either ball or roller bearings or Rudge-Whitworth wire wheels, which the company manufactures and markets through George W. Houk, Ltd., of Philadelphia.

The company's plant is an enormous one, employing approximately 1,000 men. It was organized in 1901 and in 1906 paid a dividend of 37 per cent.; in 1907 11 per cent., and in 1908 9½ per cent. on its common, since which time no dividends have been declared on that stock. Six per cent. was also paid on the second preferred stock from 1904 to 1908, when they ceased.

Harrises Likely to Get Cutting Assets.

When, for the third time, the assets of the bankrupt Cutting Motor Car Co., of Jackson, Mich., were offered for sale yesterday, 22d inst., Harris Bros., the Chicago housewreckers, bid $35,000 for the property, including book accounts. It was in the form of a guaranteed bid, the Harrises to receive 15 per cent. on all the assets yield and the creditors to share the excess. It is probable that the court will confirm the bid on Saturday.

NO INQUISITIVE MINORITY AT INTERNATIONAL MEETING

Stockholders of Investigating Turn of Mind Barred on Technicality—The $1,200,000 Mortgage Deferred by Adjournment.

They are having a hard time of it raising the $1,200,000 necessary to keep the International Motor Co., of New York, afloat. To raise the money, it is the intention to place a mortgage on the property, but the minority stockholders are displaying an uncomfortably inquisitive disposition and, as a result, the mortgage has not yet been placed.

A meeting of the stockholders designed to authorize the directors to negotiate the loan occurred on Tuesday last, 21st inst., but it proved abortive, the majority interests deeming it advisable to adjourn until tomorrow, Friday.

According to J. Dupratt White, counsel for the management, the adjournment was for the purpose of obtaining a small percentage of assents additional to those already had in order to authorize the proposed $1,200,000 loan. According to Vernon Munroe, secretary of the company, the adjournment was taken because the minority holders of voting trust certificates for preferred stock had "brought newspaper men with them to the meeting."

Some of the International stockholders believe that the publicity will prove an uncommonly good thing for the big corporation and accordingly, it is stated, they fortified several newspaper men with at least one share of their holdings in order that the desired publicity might be gained. It turned out, however, that the newspaper men, like a number of other stockholders who desired to attend the meeting, are technically not stockholders but merely owners of voting trust certificates. On this technicality, they were denied admission to the meeting.

The trustees who hold the voting trust certificates are C. P. Coleman, former president of the company, M. E. Kern, who is understood to be acting for the Mack interests, and H. K. Pomroy. Neither Coleman nor Pomroy, however, were present at Tuesdays' meeting, the former being represented by his successor, John Calder, and Pomroy by his brother, H. A. Pomroy.

The minority stockholders held a conference before the corporation's meeting occurred, at which serious allegations were made against the International management. These stockholders believe that a probing of the terms of the original consolidation of the Saurer and Mack companies, out of which the International company was formed, will disclose an interesting state of affairs. They also decided to demand an appraisal of the International assets to show both the actual conditions at the time the merger was brought about and the exact manner of the distribution of the capital stock. Instead of being able to voice their demands, however, the minority stockholders were, as stated, not permitted to participate in the corporation's meeting, and later torrid threats were made to take the matter into court.

A committee consisting of William E. Butler, George F. Hurd and M. E. Kern was appointed by the minority to represent it in the matter. The minority holders of certificates have entered a protest through the secretary, Mr. Munroe. They explain that they were admitted to previous meetings held last week and the week preceding, and they could not understand why they should be barred from Tuesday's session.

It was said that the company now holds consents representing about 68 per cent. of the preferred stock, while the minority claims to have some 26 per cent. pledged to contest the placing of a $1,200,000 mortgage on the International property. The company declares it has sufficient additional proxies promised to carry the proposed loan; and, this being so, the matter may be settled Friday. According to one statement, the Philadelphia interests, holding 2,000 shares, may agree to side with the management, it they are given representation on the board.

Stephenson Truck Gives up the Ghost.

Three creditors, on Tuesday last, 21st inst., more or less mercifully took the necessary steps toward putting an end to the Stevenson Motor Truck Co., of Milwaukee. On that day, they filed a petition in bankruptcy, the company previously having acknowledged its inability to meet obligations and agreeing to the proceedings. The petitioning creditors are the Whitney Mfg. Co., of Hartford, the Whittaker Mfg. Co., of Chicago, and a Milwaukee coal company whose claims aggregate $800.

As the company had been inactive for several months, its failure will cause no surprise. It never recovered from the effects of the adverse decision rendered in its suit against the J. I. Case T. M. Co., of Racine, for $150,000 damages. That suit grew out of a contract whereby the Case interests agreed to purchase the Stevenson property if certain conditions were fulfilled at the end of a year. When the Case people maintained that the conditions had not been fulfilled, and repudiated the contract. Stevenson resorted to law but lost out. The factory had not since been operated.

PACKARD ENLARGES CAPITAL; YEAR'S INCOME $2,157,000

Statement Disclosed at Annual Meeting Shows Increase of $3,000,000 in Assets — Officers Reelected — Figures for 1912 and 1913.

In accordance with the program of the meeting of its stockholders, held in Detroit Thursday last, 16th inst., the capital stock of the Packard Motor Car Co. has been increased from $10,000,000 to $16,000,000. Of the new issue, $3,000,000 is preferred and $3,000,000 common, making the total capital $8,000,000 of each class of stock.

Of the new common, $2,000,000 will be distributed among the present holders of the company's common stock, making the equivalent of the 40 per cent. dividend—the first in four years. The remaining $1,000,000 will be held as treasury stock to meet future requirements, while the $3,000,000 new preferred will be retained to take up the company's issue of $3,000,000 5 per cent. gold bonds due December 1, 1916, or for such other use as may be hereafter determined.

At Thursday's meeting, all of the present officers were reelected, as follows: Henry B. Joy, president; Russell A. Alger and S. D. Waldron, vice-presidents; Philip H. McMillan, secretary and treasurer; Alvan Macauley, general manager. The other directors are Richard P. Joy, Fred M. Alger, Truman H. Newberry and J. W. Packard. The annual statement of the Packard company for the fiscal year ending August 31st was made public at the time of the meeting. It was accompanied by a review by President Joy, who says "The year has been most gratifying to our executive staff. Business has held up well, even considering our delayed output, in the fall a year ago, and the trouble caused the shop by the Ohio floods. The year's profits have been fair. Not in my judgment as great as the capital invested or the volume of sales should yield, but our whole condition is better and with even a like volume of business this coming year the profits should be more favorable. Our increased capital requirements show chiefly in enlarged inventories in trucks, cars, bodies and service stock and are the main changes noticeable as the year's result."

President Joy calls attention to the fact that the "company has not a dollar of floating debt except current bills, which are punctually discounted and promptly paid."

For the first time the output of the Packard company since it was removed from Warren, Ohio, to Detroit, in 1903, is made

Digitized by Google

public, as follows: 1903-4, 192; 1904-5, 481; 1905-6, 768; 1906-7, 1,188; 1907-8, 1,470; 1908-9, 2,669; 1909-10, 3,990; 1910-11, 3,047; 1911-12, 3,617; 1912-13, 3,994; total, 21,416.

The disbursements during the ten years aggregated $79,680,565.78, the largest item being $25,456,344.68 for payroll.

The financial statement shows the company's assets to be $17,339,848.10, as against $14,663,298.86 at the end of the 1912 year. Its liabilities for the corresponding period were $14,333,591.88 and $13,464,515.04, respectively.

The reports for the two years were not presented in exactly the same form, so that detailed comparison is not possible. For instance, last year the gross sales were totaled at $14,613,057, whereas this year, instead of reporting gross sales, accounts receivable and receipts from all other sources were reported as amounting to $18,606,752, which compares with $17,328,472 last year.

In 1912 the company's gross earnings which are not given this year, were $3,412,862, but the net income figures out at $2,157,472. Cash on hand at the end of the 1912 fiscal year was $1,030,513.95; this year it was $1,374,951.12. The surplus also has been increased, from $198,783.82 to $3,006,256.22.

Of the assets, plant and equipment represent $5,264,950, and raw material, work in progress and finished vehicles $8,136,024.99, which is the largest separate increase, the stock on hand last year representing a valuation of $5,351,217.23.

It will be recalled that in making up its assets last year the Packard company took heroic action and reduced the book value of its rights, privileges, franchises, patents, etc., from $3,274,958.89 to the nominal sum of $1, at which figure they are now carried.

Of the liabilities, $10,000,000 is represented by capital stock and $3,000,000 by debenture notes. Accounts payable total $1,154,874.94.

The statement, and a comparison of the 1912 figures, are as follows:

RECEIPTS AND DISBURSEMENTS.

		Aug. 31, 1913	Aug. 31, 1912
Cash on hand September 1st, 1912		$1,030,513.95	
Receipts During Fiscal Year:			
From accounts receivable	$15,687,738.96		
From all other sources	2,919,013.38	18,606,752.34	
Total		$19,637,266.29	$17,328,472.51
Disbursements During Fiscal Year:			
For accounts payable	$15,888,362.16		
For all other accounts, including all taxes	2,373,953.01	$18,262,315.17	16,464,930.09

	$17,339,846.10	$14,663,298.86

Shock Absorber Maker and Seller Fall Out.

The Aristos Co., of New York City, which markets Mondex shock absorbers, and the United States Indestructible Gasket Co., which has manufactured some of the Aristos product, have fallen out; as a result, the latter company this week filed suit in the Supreme Court for New York county and secured an attachment for $13,568.75, but this was later released on bond. The gasket company claims that under a contract to manufacture 4,600 sets of shock absorbers with 7½-inch arms at $5 a set, 100 sets with 9-inch arms at $8.90 a set and 32 racing sets at $6.75 a set, it made 881½ sets between May 1, 1912, and May 1, 1913.

On this work it claims $4,175 was paid, leaving a balance of $657.50. It is also charged that the Aristos Co. repudiated the contract April 11, 1913, all of which has damaged the gasket company in the amount asked.

Evans Sells Lots to Acquire Capital.

Having become possessed of 341 lots of real estate, in order to obtain more of the wherewithal with which to erect its factory, the Evans Motor Car Co., of Nashville, Tenn., is auctioning 100 of the lots, giving as a bonus a $100 share of stock to each of the first 100 purchasers. Sales of the real estate are being made on the installment plan, the Evans company binding itself to refund the purchase price if it fails to build its plant "in the earliest possible time."

Handley Reelected American Motors' Head.

At the annual meeting of the American Motors Co., of Indianapolis, last week, officers were elected as follows: J. I. Handley, president and general manager; Frank E. Smith, vice-president; V. A. Longaker, chairman and treasurer; J. D. Bright, assistant treasurer; J. E. Kepperley, secretary. The directorate is made up of Messrs. Handley, Smith, Longaker, Kepperley and D. S. Menasco.

New Jersey Jobbers "Invade California."

Van Deman & Wainwright, of Newark, N. J., who market two special brands of tires—the Peerless and Bulldog—have opened a branch in Los Angeles, Cal., at 1012 South Hill street. It will be in charge of A. J. Reynolds, who previously traveled Pennsylvania territory for the Newark tire firm.

Receiver Named for Dayton's Busted Truck.

David Dunwoodie has been appointed receiver for the Dayton Auto Truck Co., of Dayton, Ohio, which, on the 11th inst., filed a voluntary petition in bankruptcy, as reported in last week's Motor World. The court authorized him to complete and dispose of the trucks on hand.

Digitized by Google

The Week's Incorporations

Portland, Me.—Doughty Tire Co., under Maine laws; to manufacture, prepare and deal in all kinds of tires, rubber goods, etc.

Cleveland, O.—Mutual Motor Stores Co., under Ohio laws; authorized capital, $50,000. Corporators—E. M. Goldring, M. West, C. F. Taplin.

Chicago, Ill.—Longwood Automobile Co., under Illinois laws; authorized capital, $12,000. Corporators—A. B. Shaw, W. K. Pattison, R. E. Baker.

Chicago, Ill.—Forest Motor Livery, under Illinois laws; authorized capital, $5,000. Corporators—Hanson Kluever, Alfred O. Baker, Frederick Kluever.

Montreal, Can.—Cadillac Motors, Ltd., under Canadian laws; authorized capital, $50,000; to manufacture motor cars. Corporators—F. G. Bush, H. W. Jackson and others.

Brownstone, Ind.—Hackendorf & Robertson Garage Co., under Indiana laws; authorized capital, $3,000. Corporators—Frank Hackendorf, Charles F. Robertson, Cora M. Robertson.

Montreal, Can.—Kelly-Springfield Tire Co., Ltd., under Canadian laws; authorized capital, $5,000; to manufacture rubber tires. Corporators—W. R. Hastings, Robertson Fleet and others.

Aurora, Ill.—Thomas Dunham Co., under Illinois laws; authorized capital, $2,500; to manufacture motor specialties, etc. Corporators—Thomas W. Dunham, Lee Mighall, Harvey Gunsul.

Mount Vernon, N. Y.—Chester Hill Motor Car Co., under New York laws; authorized capital, $1,000. Corporators—Arthur Levine, 118 West 1st street; Samuel Levine, 103 Prospect avenue.

Bridgeport, Conn.—Aurora Vulcan Co., under Connecticut laws; authorized capital, $250,000; to manufacture automobile supplies. Corporators—S. Sherwood Day, H. N. Billings, Rita K. Hall.

Lewiston, Mont.—Lewiston Mfg. Co., under Montana laws; authorized capital, $40,000; to manufacture puncture-proof compound for automobile tires. Corporators—J. J. Mayne and others.

Hartford, Conn.—John J. Roche Co., under Connecticut laws; authorized capital, $50,000; to deal in motor cars and motor car supplies. Corporators—John J. Roche, Carroll F. Roche, Henry W. Nichols.

Rochelle, Ill.—Dexter Stocking Co., under Illinois laws; authorized capital, $5,000; to manufacture and deal in motor cars, accessories, etc. Corporators—Dexter Stocking, Thad M. Graves, Elmer E. Holmes.

Buffalo, N. Y.—Star Motor Delivery Co., under New York laws; authorized capital, $20,000. Corporators—John B. Corcoran and William H. Corcoran, both of 760 Ellicott square; Richard H. Connor, 199 Pearl street.

Oneida, N. Y.—Oneida Motor Car Co., under New York laws; authorized capital, $10,000. Corporators—Frank E. Petrie, 75 Broad street; Eugene P. Aubeur, 105 Elizabeth street; Frank H. Aubeur, 33 Lenox avenue.

Milwaukee, Wis.—Robinson Auto Heater Co., under Wisconsin laws; authorized capital, $25,000; to manufacture a device for heating motor cars by utilizing exhaust gases. Corporators—J. W. Robinson and H. L. Kellogg.

Cleveland, O.—Universal Carburetter Co., under Ohio laws; authorized capital, $10,000; to manufacture and deal in carburetters. Corporators—George A. Enyon, Frank H. Pelton, I. H. Bollan, Norton McGiffin, F. M. Treadway.

Buffalo, N. Y.—Oakland Distributing Co., under New York laws; authorized capital, $20,000; to conduct a general motor vehicle business. Corporators—Fredereick Baton, 799 Bird avenue; Thomas F. Donohue, Eggersville; William G. Grey, Buffalo.

Elgin, Ill.—Auto Service Co., under Illinois laws; authorized capital, $3,000,000; to conduct a motor livery service, deal in motor cars and do a general transfer and storage business. Corporators—Fred Hoagland, Elmer A. Sowers, Harvey King.

Charles City, Ia.—Western Motor Appliance Co., under Iowa laws; authorized capital, $25,000; to manufacture appliances and attachments for gas, gasolene and kerosene engines. Corporators—George C. Hintz, William Butz, W. J. Frevert, H. E. McCray.

New York, N. Y.—Greater New York Automobile Trucking Co., under New York laws; authorized capital, $10,000. Corporators—Leo Lang and Lena Lang, both of 185 Hemlock street, Brooklyn; Joe Yokel and Bertha Yokel, both of 545 West 111th street.

Buffalo, N. Y.—Auto Electric Equipment Co., under New York laws; authorized capital, $15,000; to manufacture electric generating machinery and appliances. Corporators—Edward W. Werick, Charles H. Werick and Fred C. Schoenthal, all of Buffalo.

New York, N. Y.—Flexible Rim-Tire Co., under New York laws; authorized capital, $25,000; to manufacture patented tires for motor vehicles, etc. Corporators—C. Elmer Clapp, 181 West 75th street; Alpheus H. Fayeur, 43 Cedar street; Ernest G. Ofeldt, Nyack.

New York, N. Y.—Suffolk Lubricating Oils & Gasolene Co., under New York laws; authorized capital, $1,000. Corporators—Sol Namorich, 591 Bedford avenue, Brooklyn; Louis Mannorick, 3-5 Gouvenour street; Anna Abramson, 591 Bedford avenue, Brooklyn.

New York, N. Y.—John M. Brisben Co., under New York laws; authorized capital, $26,000; to conduct a general motor vehicle business. Corporators—Thomas F. McMahon, 1402 Broadway; John M. Brisben and William H. Clover, both of 20 West 63rd street.

New York, N. Y.—Schildwachter Automobile Co., under New York laws; authorized capital, $30,000; to conduct a general motor vehicle business. Corporators—Augustus Linden, 414 West 120th street; Christian W. Schildwachter, 45 East 127th street; Charles G. Schildwachter, 63 East 128th street.

Changes in Capitalization.

Muncie, Ind.—Muncie Gear Works, to $500,000.

Racine, Wis.—Harvey Spring Co., to $300,000.

Milwaukee, Wis.—Wisconsin Motor Co., to $150,000.

St. Louis, Mo.—St. Louis Taxicab Co., from $50,000 to $25,000.

St. Louis, Mo.—Electric Garage & Service Co., from $2,000 to $15,000.

Cincinnati, O.—Bond Hill Auto Service Co., from $2,000 to $5,000.

Cleveland, Ohio—Buckeye Motor Trucking Co., from $1,000 to $25,000.

Cleveland, Ohio—Cleveland Rotary Motor Co., from $1,000 to $100,000.

New York, N. Y.—Allied Motor Accessories Co., from $10,000 to $140,000.

KRIT CHARGES DEALER WITH SLANDER; DEMANDS $10,000

Claims Oklahoma City Tradesman Made Damaging Statements—Attempted to Influence State Fair Visitors Against Krit.

Because of slanderous and otherwise damaging statements which it is alleged he has made, J. T. Wheatly, its former agent in Oklahoma City, has been made the defendant in a suit brought by the Krit Motor Car Co., of Detroit, for $10,000. Of this amount, $5,000 is asked for injury to business and the other $5,000 for punitive damage.

According to the complaint, the Krit was handled in Oklahoma City by Wheatly and John L. Sharp, as copartners, Wheatly, however, representing another line of cars on his own account. It was during the State Fair, October 2nd, 3rd and 4th, at which both lines were exhibited, that Wheatley is alleged to have made the slanderous statements, the names of those to whom he made them being given in the complaint.

Among other things, it is charged that Wheatly declared that the Krit creditors were dissatisfied with the terms of the reorganization which had been effected and that the company had been thrown into the hands of a receiver; also that it had an overstock of cars and had discontinued all save two of its branches, which meant that anyone purchasing a Krit car would be unable to get repair parts therefor.

Apparently the statements were made by Wheatly in an endeavor to make sales of the car he was handling in competition with the Krit. Immediately the information was conveyed to the Krit company, in Detroit, it lost no time in instituting suit.

Suit Follows Repudiation of Contract.

Because the Pennsylvania Rubber Co., of Jeannette, Pa., refused to recognize the transfer of a crude rubber contract from the New York Commercial Co. to Heidelbach, Ickelheimer & Co. suit was filed against it this week in the Supreme Court for New York county by the last named concern for $2,489.56. The Pennsylvania had contracted with the New York Commercial and when the latter went into bankruptcy the trustee transferred a contract for 17,340 pounds of rubber to the company which is suing.

Heidelbach, Ickelheimer & Co. tendered the delivery of the rubber, but the Jeannette company refused it; it was then sold for $12,212.83 to another buyer, whereas under the contract the Pennsylvania Rubber Co. would have paid $14,471.05. The difference between these two figures and an added expense of $231.34 makes up the amount asked. The complainant sues under the name of its several members, who are Alfred S. Heidelbach, Henry R. Ickelheimer, Alfred Lichtenstein and Charles Einsiedler.

Stepney and Rutherford Friends Again.

The suit and cross suit which were filed in the Supreme Court for New York county because of a disagreement by the Rutherford Rubber Co., of Rutherford, N. J., and the Stepney Tire & Rubber Co., of New York City, over a tire contract dated November 22, 1911, were settled and discontinued this week; the contract called for the sale of 10,000 low-priced tires to the Stepney company and a dispute arose over the payment.

The Rutherford company filed the first suit, asking for $3,789.92 as an unpaid balance, and the Stepney company replied with the statement that all the tires delivered were not worth more than $10,000, that they were billed at $43,376.81 and that inasmuch as $40,836.31 was paid, full value was received by the Rutherford company.

Later the Stepney company filed a cross suit, making a modest claim for $72,923 which it declared was due because of incurred expenses, lost profits and other items attributable to defects in the tires.

Franklin Closes Last of its Branches.

Pursuant to its policy of closing its factory branches, the Franklin Automobile Co., of Syracuse, N. Y., disposed of its two remaining branches last week, turning the Chicago branch over to Frank H. Sanders and the Cincinnati branch to Newman Samuel; Sanders has been with the Franklin sales department for ten years, during which time he managed several different branches; Samuel has been a salesman in the Cincinnati branch for two years and for five years prior thereto was the company's St. Louis dealer. The Franklin company opened its first branches in 1906, in Chicago and Boston, and the list at one time totaled 13, the others being in New York, Pittsburgh, Baltimore, San Francisco, Cincinnati, Albany, N. Y., Rochester, N. Y., Buffalo, Cleveland, Syracuse and St. Louis

Lowe Makes Answer in Barber Plug Suit.

Denials that William Barber, of Brooklyn, achieved anything worthy of note when he patented a spark plug June 26, 1903, is the substance of the answer to his suit filed this week in the United States District Court for the Southern District of New York by the Lowe Motor Supplies Co., Inc., of New York City; Barber claims a basic patent on the two-piece insulation used in several plugs, patented nuder the number 732,032.

BOSCH-HONOLD PATENT MAY INVOLVE CYCLECAR MAKERS

Warning Issued that it Controls Basic Rights to Magneto Ignition for Two-Cylinder V-Type Motors —What its Claims Include.

If they heed the warning issued by the Bosch Magneto Co., other manufacturers of magnetos, cyclecar manufacturers and near-manufacturers of cyclecars will pause and consider patent No. 974,967, issued to G. Honold, November 18, 1910. The patent is owned by the Bosch company and is claimed to control practically all successful forms of magneto ignition for two-cylinder gas engines of the so-called V-type. The two claims of the patent on which the Bosch people lay most stress are as follows:

"The combination of a dynamo electric generator having means for producing a plurality of substantially equal maximum rates of change of flux at alternating longer and shorter intervals, of ignition circuits arranged to be energized by said changes of flux, and two explosive engines having igniters within the ignition circuits and arranged in intersecting planes.

"The combination with two explosive engines having the axes of their cylinders inclined to each other, said engines being provided with igniters, of an electric generator having its armature driven by and at a fixed speed with relation to the engine, and having generator windings, means for producing an intermittent maximum rate of change of flux through the generator coils at alternately longer and shorter angular intervals between the times of igniton and ignition circuits including the generator windings and the respective ignition devices of the engine, whereby a maximum voltage is produced at the igniter of each engine at the time of ignition."

The warning issued by the Bosch people implies that prompt action for infringement will be instituted unless its rights are respected.

McGraw Declares 10 per Cent. Dividend.

At its annual meeting last week, the McGraw Tire & Rubber Co., of East Palestine, Ohio, reduced the number of its directors from 15 to 11 and declared a dividend of 10 per cent. The directors who remain after the reduction are as follows: E. C. McGraw, Lenore H. McGraw, R. W. McGraw, John Morgan, R. F. Taggart, L. M. Kyes, J. C. Chamberlain, F. H. Ray, J. C. Chaplin, J. S. Wilson. They in turn reelected the following officers: E. C. McGraw, president; L. M. Kyes, secretary; R. B. Taggart, treasurer.

In the RETAIL WORLD

A. R. Castle & Co., of Britt, Ia., are about to erect a new garage.

I. B. Bush, of Parkersburg, W. Va., is about to build a garage.

The Seabury-Carlson Co., of Logan, Ia., is about to build a new garage.

J. R. McGiffert, of Duluth, Minn., plans to build a garage on 24th street.

Dunnard & Cook, of Ceylon, Minn., will build a garage; the estimated cost is $5,000.

L. B. Shaw, of Riddlesburg, Pa., has opened a garage; it is located on 4th street.

The El Paso (Tex.) Garage has opened a new garage; it represents an expenditure of $10,000.

The Central Motors Co., of Owensboro, Ky., is erecting a garage; Elmer Little will manage it.

Clinton Davis, of Tipton, Ia., has secured an interest in the Northwestern Garage in that town.

H. J. Wilson has opened salesrooms in Emmetsburg, Iowa. He has the Studebaker line.

Harvey Hadley and Newton Poindexter, of San Francisco, plan to open a garage in Bend, Ore.

A new garage is being erected in Milledgeville, Ga. It will be styled Milledgeville Garage.

Cyrus G. Deer, of Cumru, Pa., has let the contract for a two-story garage; the cost will be $5,000.

Howard S. Johnson, of Summit, N. J., proposes to build a garage; the site is on Speedwell avenue.

Seeley Bros., of Rensselaer, N. Y., plan to build a garage on Ferry street; the estimated cost is $10,000.

W. E. Cady & Son, of Corry, Pa., have secured bids on a garage; it will be erected on East South street.

C. W. Hager has admitted R. H. Sanborn to partnership in the Alhambra Original Garage in Alhambra, Cal.

E. M. McBrier, of Montclair, N. J., plans to erect a garage at 203 South Mountain avenue; it will cost $3,500.

The Duluth Auto Tire Repair Co. has entered the trade in that Minnesota city; Louis Kazmier is the proprietor.

The Gay-Fourth Tire Repair Co. has opened a new shop in Columbus, Ohio. It is located at 139 East Gay street.

R. L. Oakley, formerly of Detroit, has been made Oregon distributer of Commerce trucks; he will locate in Portland.

Ray Carson, of Iowa Falls, Ia., has sold his garage business to Voss & Conard. It is located on South Dubuque street.

New Diamond Garage is the style of a new business in Sistersville, W. Va. It is located in the Hippodrome building.

Horace Rainey, of Columbia, Tenn., plans to erect a garage and salesrooms, 70 x 125 feet; the site is on South Garden street.

Raymond Bros. of Waterbury, Conn., have let the contract for a new garage; they will build at 453 West Main street.

Pirtle & Co., of Phoenix, Ariz., have secured permission to build a new garage on North Central avenue; it will cost $10,000.

Robinson & Co. is the style of a new dealership in Des Moines, Iowa. The company has the State agency for the Allen car.

The J. T. Stubbs Co., of Providence, R. I., has taken over the building at 75 Mathewson street; the company handles Hendersons.

The garage firm of Jenkins & Craig, of Stanhope, Ia., has been supplanted by a new combination under the style Craig & Olsen.

The Morristown Automobile School, of Morristown, N. J., will erect a garage; it has purchased a site at South and Boyken streets.

J. W. Leakin, of Baltimore, Md., has secured permission to erect a garage, 60 x 138 feet, on Cathedral street; it will cost $27,000.

Black & Kirkpatrick, of Rockville Center, Iowa, have sold their garage to E. L. Smith and Ben Obye; the latter will continue the business.

Clayton Jackson has purchased the interest of R. H. Munford in the Escalon (Cal.) Garage; the style now is Mead & Jackson.

Guy Johnson, of Morrison, Ill., is installing his garage business in the Morrison Specialty Co.'s building, which he recently purchased.

Harry Crouch has taken over the stock, garage and business of the Nevada Auto Co., of Nevada, Ia. He will handle Buick and Studebaker cars.

E. P. Madeley, of Rogers, Tex., has purchased from R. B. Lewis the Rogers Garage; he exchanged a farm for the garage and a parcel of real estate.

C. E. Warren, proprietor of the Red Apple Garage in Wenatchee, Wash., is to have a new garage; the site selected is located on South Wenatchee street.

The Sweeten Automobile Co., of Philadelphia, Pa., has awarded the contract for a one-story garage, 55 x 100 feet; it will build at 3430 Chestnut street.

Frank J. Langorio, of Pittsburgh, Pa., has been granted authority to build a two-story garage on Monitor street; the application states that the cost will be $17,500.

The Eastern Motor Co., of Atlantic City, N. J., has taken possession of new and larger quarters at 2720 Atlantic avenue; the company stocks Mercer, Overland and Paige cars.

R. R. Browne, formerly manager of the Erie Supply Co., of Toledo, Ohio, has branched out for himself; he has opened an accessory and supply store at 126 Erie street.

Albert C. Lusby has entered the trade in Los Angeles at 1200 South Olive street, in the building formerly occupied by the United Motors Co. He has the Abbott-Detroit agency.

The Block-Miller Hardware Co., of Lawton, Okla., has taken over the automobile business of R. T. McDuffie; it will be operated by J. M. Jones, of Oklahoma City, whose father recently purchased the Block interest in the hardware company.

J. L. Evans has purchased the interest of William Work in the Connellsville (Pa.) Garage; the other half of the business is owned by V. J. Clark, who retains his interest. An addition, 165 x 64 feet, will be erected, increasing the garage's capacity from 25 to 125 cars.

Frank P. Oswald, for three years vice-president and superintendent of the Overland agency in Grand Rapids, Mich., has entered business with John D. Hess, Jr. The latter recently secured the Kissel agency; the new business will locate at 21-23 Campau avenue.

The F. B. Stearns Co.'s branch in Cali-

Digitized by Google

fornia having been incorporated and removed from San Francisco to Los Angeles, the Stearns business in Northern California has been taken over by the Argonaut Motor Sales Co., of San Francisco; the Argonaut company also stocks Abbott-Detroits.

The Hupmobile retail business in lower Michigan, including Detroit, has been taken oved by the Grasser Motor Co., of which J. M. Grasser is the head. This company has acted as Hupmobile distributer in Northwest Ohio and from now on will operate in both Toledo and Detroit.

P. A. Wagner, for 35 years in the real estate business in Spokane, Wash., and W. J. Schuh, formerly proprietor of the Iowa Auto & Garage Co., of Dubuque, Ia., have formed a copartnership and will open a garage and salesrooms in Spokane; they plan to erect a 10,000 building on the South Side. Schuh will be president and Wagner secretary.

The Archambault Motor Car Co., of Milwaukee, Wis., has been dissolved; E. J. Archambault, the proprietor, is a baseball club owner and will devote his time to other affairs. The garage and salesrooms at 177-79 Ogden avenue, where the company handled Lozier and Michigan cars, have been taken over by the Hughes Motor Car Co., the Apperson distributer in Wisconsin.

The Deeds & Hirsig Mfg. Co., of Nashville, Tenn., has dissolved; J. B. Deeds, as the J. B. Deeds Buggy Co., will handle the wagon and implement business and W. G. Hirsig will operate the Lozier and Paige-Detroit agencies which were a part of the company's business. Deeds retains the old location on Broadway and most of the employes; Hirsig removed to a new location on Broadway.

The Divine Motor Car Co., of 2430-32 Michigan avenue, Chicago, a Garford dealer, has been succeeded by a Garford branch under the style Garford Motor Car Co. The new company has taken over both the business and location. T. J. Edwards, formerly located at the Garford factory, is manager. E. C. Devine, head and founder of the company which bore his name, has retired from business and will spend the winter in California.

Recent Losses by Fire.

Harlinger, Tex.—J. H. Bailey; garage destroyed. Loss not stated.

Anderson, S. C.—A. L. Todd; garage destroyed by explosion. Loss not stated.

Los Angeles, Cal.—H. W. Hawley; garage, car and two motorcycles destroyed. Loss, $4,000.

Memphis, Tenn.—Southern Automobile Co., North 3rd street and Washington avenue; garage and 11 cars destroyed. Loss, $20,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

W. F. Meyer has been appointed manager of the Washington (D. C.) branch of the Motz Tire & Rubber Co., of Akron. His appointment is in the nature of promotion, Meyer having been identified with the Motz interests for some time.

F. E. Miles has been appointed purchasing agent for the Palmer & Singer Mfg. Co., of Long Island City, N. Y. Previously he served the Mais Motor Truck and the National Motor Vehicle companies, of Indianapolis, in a similar capacity.

John Yoke, who previously was connected with the Maxwell factory in Detroit, has been appointed manager of the Maxwell branch in Omaha, which is conducted under the style Maxwell Motor Sales Corporation. He succeeds J. M. Opper, resigned.

Robert M. Barker, for the past two years advertising manager of the Chase Motor Truck Co., of Syracuse, N. Y., has resigned to accept a similar position with the Palmer-Moore Truck Co. of the same city. Before going to Syracuse, Barker was for six years in the advertising business in New York City.

F. A. Robinson, chief accountant of the Packard Motor Car Co., of Detroit, has been promoted to the post of comptroller. In addition to his new duties, Robinson, who has been identified with the Packard company for four years, will be the direct representative and assistant to General Manager Macauley.

F. H. Hoover has been appointed Eastern district manager for the Woods Motor Vehicle Co., of Chicago, and will direct the affairs of the Woods electric in all territory east of Pittsburgh. Hoover, who previously was connected with the Whitten-Gilmore Co., of Boston, will make his headquarters in Philadelphia.

Pettit Goes from Cars to Trucks.

William S. Pettit, who has made an enviable reputation as advertising manager of the Studebaker Corporation for the past two years, has resigned to go into the truck business as sales manager of the Commerce Motor Car Co. of Detroit. Pettit's experience with the Studebaker Corporation extends over a period of three years, during which he has had ample opportunity to study the methods of such successful sales managers as George E. Keller, Paul Smith and E. R. Benson.

In his new venture Pettit associates himself with Walter E. Parker and H. B. Bennett, the same group of capitalists who own and control the Mexican Crude Rubber Co., with headquarters at Detroit, and who also own and operate the Hotel Cadillac, Detroit, which means that there are ample financial resources back of the Commerce company. They build a friction drive truck that has been notably successful. Pettit is not only one of the best liked but one of the sanest advertising men in Detroit's large colony.

To Organize New York State Dealers.

After several false alarms, the logical body to bring about a State organization of New York dealers finally has taken the work in hand, the Automobile Dealers' Association of New York City having voted to direct its efforts to that end.

According to the latest statistics, there are now 1,800 automobile dealers in the State, and it is believed that a large majority of them readily will join the State-wide organization which is in view. No date has yet been set, but it is almost certain that the meeting for the purpose will be held in Albany.

Apart from other considerations, it is believed that a State organization of the sort can wield considerable influence, not only to obtain favorable legislation but to prevent the introduction or passage of adverse laws.

Simpson Claims he Was Frozen Out.

Edward W. Simpson, who in the latter part of 1912 formed the Simpson Auto Supply Co. in Grand Rapids, Mich., and whose corporation subsequently passed through bankruptcy, is not satisfied with the present condition of affairs and his filed a suit asking that a receiver be appointed and that the company be dissolved. The bankruptcy led to a reorganization through which Julius and Emil Tisch entered the management of the business, and Simpson now claims that they have informed him that he has no further interest in the company.

Braender and Willis Hold Different Views.

A slight difference apparently exists between the views of the E. J. Willis Co., of New York City, and the Braender Rubber & Tire Co., of Rutherford, N. J., regarding a tire account between the two companies; at any rate, the Braender company this week filed suit in the Supreme Court for New York county, claiming that between January 27 and September 1, 1913, it furnished the Willis company with tires to the value of $35,643.46 on which the Willis company paid and received credit of $34,069.46, which leaves a balance of $1,574.

THE POPULAR PRICED ELECTRIC CAR.

Why is there no such thing on the market as a popular priced electric pleasure car?

There have been expectations that proved "false alarms" on several occasions, but despite not a few reasons why there should be electrics purchasable at prices comparable to the prices of many gasolene cars, relatively high prices prevail. There is no question but that there is a field for such a vehicle. There are many who would prefer the quiet running and simplicity of operation of the electric if they could get the machine at the price of a "gas" car.

The ancient idea that an electric is able to run only a few miles before requiring a fresh charge has been exploded. Runs of 100 miles on a single charge are not uncommon, and the distance that can be covered in a day with the assistance, perhaps, of a "boost" during the lunch hour, is sufficient to satisfy enough people to form a purchasing class well worth considering. Recent trips, and others not so recent, have demonstrated that with a little forethought tours of almost any duration can be made without more trouble than with gasolene cars. And while makers of electrics never have attempted to build cars as fast as gasolene cars, the rates that can be attained are quite sufficient to satisfy reasonable people. An average speed of close to 22 miles an hour for the 250-mile run from Boston to New York, for instance, indicates a high maximum speed.

As to the problems involved in turning out popular priced electrics, there would seem no reason to believe that they are any more serious than those encountered, and effectually disposed of, in the production of gasolene cars. So far as frames, axles, wheels, steering gear, tires, springs and so on are concerned the two types are on an even footing, and the same is true of bodies. This leaves as the doubtful group the battery, motor and controller.

It is true that it costs a good deal to buy a single battery at retail. In fact, it would make a low priced electric look like a practically impossible proposition. But the same is true of the engine of a gasolene car. It simmers down to the question of quantity production and cost prices. The commercial law that one out of ten thousand costs amazingly less than one out of a hundred holds good with storage batteries as with anything else. As for electric motors, they are susceptible of quantity production methods that are most effective in reducing manufacturing costs.

As a matter of fact, it would seem that the only thing lacking to the production of a popular priced electric is someone with the "sinews of war" and the "nerve" to get into the business on a big scale. When he discovers himself he almost surely will be richly rewarded.

LOPPING OFF THE BRANCH HOUSES.

No trend in the merchandising of motor cars is more pronounced than that which points to the discontinuance of branch houses, which means, of course, leaving the sale of cars in the hands of local dealers. The number and importance of the manufacturers who have taken such action during recent months suggests many things, but none more strongly than that, with few exceptions, the territorial branch house is rarely a paying investment, or, at any rate, an investment that wears well or indefinitely.

Often the location of a branch house is necessary when proper representation cannot be found, or when it is desired to establish a particular car, or other exclusive article, in a particular market, and when the interests involved are sufficiently large or numerous the branch may endure; but, speaking generally, it is undoubted that many branches represent a very considerable duplication of headquarters' expense and effort and involve the use of more or less unnecessary red tape; and it is certain that the average dealer is always possessed of the notion that dealing directly with the factory carries with it benefits which he himself cannot specify but which he fancies exist.

While the economy that comes of saving duplicated effort and expense undoubtedly is the underlying cause of the recent discontinuance of so many automobile branch stores, there is no doubt that the several other factors all have to do with the case. The tendency is also an indication that many makers now realize that their interests are safe in the hands of dealers.

That cars and tires, however, are things apart, and like other separate but closely related wares, must be marketed along different lines, is evidenced by the fact that while car makers are discontinuing branches, tire manufacturers are increasing the number of their establishments of the sort.

193 ACCESSORY MAKERS TO EXHIBIT AT NATIONAL SHOW

Ninety Unaffiliated Exhibitors to Mingle with the 103 M. A. M. Members —Tires Will Be There but the "Tire Group" Will Not.

Though nearly all of the better known tires and the proud names of their makers will be missing from the forthcoming National shows, due to the action of the "tire group" of the Motor and Accessory Manufacturers, Inc., tire manufacturers, nevertheless, will not be lacking, at least six of those not affiliated with that organization having booked space for the New York show in January next. They are part of the 90 unaffiliated accessory exhibitors to whom space has been alloted by the Automobile Chamber of Commerce. Added to the 103 M. A. M. members who will display, they bring the total number of accessory manufacturers booked for New York to 193. The 90 unaffiliated space holders are as follows:

Miller Rubber Co.; Howe Rubber Co.; Thermoid Rubber Co.; Coloumb Tire Import Co.; United & Globe Rubber Mfg. Co.; Newmastic Co.; National Rubber Co.; Essex Rubber Co.; Standard Woven Fabric Co.; Chas. O. Tingley & Co.; Baums Castorine Co.; Platt & Washburn Refining Co.; Ajax Trunk & Sample Case Co.; Asbestos & Rubber Works of America; H. P. B. Electric Co.; Thurber Rotary Starter Co.; English-Mersick Co.; R. I. V. Co.; Nonpareil Horn Mfg. Co.; Marburg Bros., Inc.; H. H. Franklin Mfg. Co.; Burg Auto Trunk & Specialty Co.; A. B. Arnold; Majestic Mfg. Co.; Julian H. Faw; American Taximeter Co.; A. & R. Justice Co., Inc.; Eclipse Machine Co.; B & L Auto Lamp Co.; W. H. Brown; Houpert Machine Co.; Silvex Co.; Detroit Steel Products Co.; Hawthorne Mfg. Co.; Ernest Flentje; Golde Patent Mfg. Co.; Perfection Spring Co.; Thos. Prosser & Sons; K-W Ignition Co.; L. J. Mutty Co.; Ralph Waldt; McQuay-Norris Mfg. Co.; United States Gauge Co.

Mayo Mfg. Co.; Brown Co.; Stevens & Co.; F. A. Baker & Co.; Northway Motor & Mfg. Co.; Crescent Motor Co.; Champion Spark Plug Co.; Cleveland Hardware Co.; Allan Motor Co.; Rushmore Dynamo Works; Rich Tool Co.; J. R. Ashley Co.; Wm. R. Laidlaw, Jr.; C. A. Willeys Co.; Model Gas Engine Works; P. Reilly & Son; Chas. E. Miller; Frazer Lubricator Co.; Peter A. Frasse & Co.; Jones Electric Starter Co.; Universal Lubricator Co.; Bock Bearing Co.; Fentress-Newton Mfg. Co.; International Metal Polish Co.; Fitzgerald Mfg. Co.; J. Eavenson & Son; Havoline Oil Co.; Johns-Manville Co.; Donnelly Motor Equipment Co.; David Kahnweiller's Sons; Cox Brass Mfg. Co.; Asch & Co.; Universal Shock Eliminator Co.; Eveland Engineering & Mfg. Co.; Bausch Machine Tool Co.; Motor Patents Co.; Pyrene Mfg. Co.; Emil Grossman Mfg. Co.; Rhineland Mch. Wks.; New York Coil Co.; J. Alexander Mfg. Co.; John T. Stanley; Metal Stamping Co.; Wayne Oil Tank & Pump Co.; Townsend & Co.; Aristos Co.; J. Sonneborne Sons, Inc.

New York Limits Truck Loads and Speeds.

Limitations of truck weights, speeds, treads and loads have been issued by Commissioner of Highways John N. Carlisle of the State of New York and became effective Monday, 20th inst. Penalties of from $10 to $100 are provided for violations of the regulations.

A limit of 800 pounds per inch of tire width is placed on all power vehicles unless the commissioner specifically grants an excess; 90 inches is the maximum tread on State and county roads for power vehicles except traction engines, which may have a tread of 100 inches; with a load of four tons no vehicle shall exceed 15 miles an hour; with a load of six tons, including the vehicle, the speed shall not exceed six miles an hour when steel tires are used or 12 miles when rubber or similar tires are the equipment; special permission must be secured to move a vehicle which with its load weighs more than 14 tons, and no more than eight tons shall be carried on any one axle. On traction and road engine wheels which are fitted with flanges, ribs, clamps, cleats, lugs or spikes, these projections must not be less than 2½ inches wide and 1½ inches high and so placed that not less than two cleats on each wheel shall be on the ground at all times, and the weight must be the same on all parts of the cleats.

Importers' Show Opened to American Cars.

Influenced, it is explained, by the enactment of the Underwood tariff bill, the Importers' Automobile Alliance, which fathers the Importers' Show held annually in the Hotel Astor, New York, has voted to throw open its doors in January next to a limited number of American cars. It is stated that five American applications already are in hand, of which number two already have been granted space in the Astor—the Simplex and the Fiat.

Carbon Remover Coming from Seattle.

H. L. Davies has organized the Oxygen Carbon Remover Co. in Seattle, Wash., for the purpose of manufacturing a device suggested by the title of his enterprise. Temporarily he is located at 305 East Pike street in Seattle.

*Indicates Sanction by A. A. A.

Oct. 15-25, New York City—Annual electrical exposition and electric vehicle show in Grand Central Palace.

ALCO INVESTIGATION BUMPS UP AGAINST "STEAM ROLLER"

"I Vote $30,000,000 of Stock," Says Sheldon, and Insurgents Are Flattened Out—But President Marshall Promises Information.

What usually happens to any man—or group of men—who holds less than 51 per cent. of the stock of any corporation happened to the minority stockholders of the American Locomotive Co. at the annual stockholders' meeting in New York on Tuesday, 21st inst.

The meeting was made momentous largely because of criticisms which followed the company's recent abandonment of its Alco automobile department, Isaac M. Cate being the most strenuous of the critics. At the meeting, Cate, however, represented but 950 shares of stock and, although several other stockholders joined in his demand for an investigation, they were flattened out when George R. Sheldon, the New York banker, voted $30,000,000 worth of stock in favor of the "insiders."

During the session it came out that a committee of investigation is already at work, but as its report is not ready, a demand arose for an independent investigation conducted by men not identified with the Locomotive company in any way. One of the stockholders proposed the appointment of a committee of which William R. Willcox, former chairman of the New York Public Service Commission, was to be the head, but Sheldon and his $30,000,000 worth of holdings quickly put an end to that suggestion.

President Marshall and ex-Governor Griggs, of New Jersey, the latter one of the present investigators, both declared themselves in favor of submitting the final report to the stockholders, but no assurance to that effect was given; in fact, President Marshall was reminded that several years ago a special committee had made a report on the company's recently abandoned automobile department, and although stockholders were promised copies of it none had ever reached them.

Among the questions that were asked of President Marshall were these: "Why it was necessary to take $3,500,000 from the profits of the company to make up the losses in the automobile department; whether it was a fact that a majority of the directors held very little stock in the company and that they were interested in other companies that sold material to the American Locomotive Co.; the reason for the sale of $900,000 of preferred stock of the company in 1907, just before the panic, and the purchase of an equal amount of common stock, and whether money could be saved if the offices of the company were moved to Schenectady."

President Marshall said he would answer the questions later.

One shareholder wanted to know what salaries were paid and the information was given. The president and one vice-president, it was said, got $25,000 and the other vice-president got $30,000. In good years, it was explained, there was a salary bonus which sometimes amounted to as high as 30 per cent.

It was announced after the meeting that the same board of directors had been elected.

American Cars Staged at Paris Show.

In at least one respect, the annual French Automobile Show, which opened this year on the 17th of October and will last 10 days, instead of opening during the first week in December and holding the boards for three weeks, is a great deal different from last year's exhibition, which uncovered three or four new, or nearly new, poppet-valveless motors; this year there is nothing new in the poppet-valveless line, and very little that is new in any other line. All told, there are upward of 700 separate exhibits, the number being about the same as last year, and, as usual, American manufacturers are well represented.

Almost as a matter of course, the Ford company has the largest foreign—to French eyes—exhibit, the whole Ford line, roadster, touring car and town car, being displayed in front of a background of enlarged photographs showing the immense Ford plant in Detroit from the inside and the outside. In the drawing for exhibition spaces, the Hudson representative was allotted stand No. 1 and the exhibit is so placed that it faces everyone who enters the Grand Palais.

Among the other American makers whose cars steadily are looming larger in the eyes of the French motoring public, the Cadillac company displays both cars and chassis, as do the Overland, Buick, Mitchell, Krit, and Packard companies, the latter having only one "2-38" model on exhibition, owing to the early opening of the show.

Garage Didn't Pay for its Gasolene.

Charles Stork and John Wilmarth, who trade in Brooklyn, N. Y., as the Park Hill Garage, are defendants in an action instituted this week in the Supreme Court for New York county by the Standard Oil Co. of New York; it is charged that between November 2 and December 31, 1912. the garage was furnished with supplies to the value of $688.45 on which but $100 was paid, leaving a balance of $588.45, for which the Standard asks.

HIGH COURT BARS CADILLAC AND ITS "COLLAPSED WHEEL"

Declines to Interfere and Hasten Litigation in Lower Tribunal—Action Brought by Car Owner for $40,000 Must Be Retried.

That "collapsed wheel case" in which the Cadillac Motor Car Co. is the defendant and E. Wells Johnson, of Amsterdam, N. Y., the complainant, must be retried in the United States District Court in Syracuse, N. Y. Efforts of the Cadillac company to hasten the litigation, which harks back to 1909, when the wheel of Johnson's car collapsed and injured him, proved futile this week when the United States Supreme Court declined to grant a writ of certiorari.

The suit was tried and a verdict of $10,000 given to Johnson, but Judge George W. Ray set this aside and directed a new trial; inasmuch as the case likely will be appealed whichever way it goes, the Cadillac company sought to have the verdict stand so that an appeal could be taken at once; wherefore the Cadillac company asked the Circuit Court of Appeals for an order compelling Judge Ray to rescind his order for a new trial. The Appellate Court denied this request and the matter was carried to the Supreme Court. The denial of a writ of certiorari means that the action must be retried; when the trial is ended an appeal from the verdict may be taken, but until then the case must remain on the calendar of the court in Syracuse. Johnson asks $40,000, claiming the Cadillac company is responsible for a defective wheel, and the action is said to have cost already about $15,000.

Double Fabric Erecting New Factory.

The Double Fabric Tire Co., of Auburn, Ind., which was visited by fire last spring, is erecting a new brick and concrete factory which will be ready for occupancy within 60 days. The building is 180 x 80 feet and will be thoroughly modern in every respect, including sprinkler system, etc. The equipment will include a calender and rubber mill and other machinery necessary for the manufacture of the Interlock inner tire.

Alliance Off, Gibson Turns to Rochester.

The Gibson Motor Car Co., of which C. E. Gibson is the moving spirit, and which some five months ago was reported to have acquired a factory site in Alliance, Ohio, evidently did nothing of the sort. It is now stated that it has about leased a building in Rochester, Pa., where Gibson resides and where much of the company's stock has been sold.

NECESSITY FOR SAMPLE CAR

The Prospect Who Can't be Shown What He Came Miles to See Loses His Enthusiasm—Where Stock of Cars Would Have Doubled Sales.

An automobile merchant who is in the business of selling cars should have at least a sample of his wares on hand all the time—and, if possible, should carry a stock so that he is prepared to make immediate deliveries—often a big advantage over competitors.

The factory had been urging an Indiana dealer to carry a stock of cars. The dealer thought it was a clever scheme on the part of the factory to get his money tied up—and while he could have financed five or six extra cars without any great inconvenience he preferred to do business with two cars—one supposed to be his regular demonstrator and the other supposed to on his floor to show out-of-town customers and prospects who might happen in. As a matter of fact, it seemed as if fate arranged matters so that prospects and customers alike seemed to run in bunches of two or three, with the result that both cars were either in or out—and just at the moment when both cars were out someone usually dropped in to see the latest model.

Sales Which Wrong Management Lost.

The trade was mostly farmers—and when they came several miles to see a car they wanted to see it. Alas! they were often disappointed. In many cases farmers have been known to hang around for three hours waiting for a demonstrator to come back—and there was no car of the up-to-date model in the showroom to keep them busy with till the demonstrator got back. "In many cases we could have made the sale and had the car delivered before the demonstrator got back if we had only carried a stock and had a new car on the sales floor," remarked a salesman. "This living from hand to mouth—selling from sample and catalog stuff is not real business; we could double our sales, I am sure, if we only had the cars instead of having to wait a week or ten days for factory shipments. It is not the same as if there were eight or ten models; there's only two, touring car and roadster, and we know that 90 per cent. of our sales will be roadsters. As it is, we frequently lose sales that might just as well be ours."

PLANNING BUSINESS; ITS MEANING AND ITS EFFECT

Plan your business. The old saying, "Foresight is better than hindsight," is another way of saying that it pays to plan your business and run it instead of letting it run you. Planning means being prepared. It means being ahead of time—not behind time. It means a full day's work—and all of it the sort that counts.

Work Done Not Dependent on Time Spent.

There are men who work for 10 hours steadily, but who accomplish little compared to others who work only six or eight hours, but who plan their work carefully. Any salesman who has been on the road knows what a tremendous advantage it is to have all his work laid out so that he knows just where he is going to call that day and how much time he can spend at each place. He must lay out his work weeks in advance, so that within certain time limits he will have covered his territory adequately. He sits down with timetable and route book and gets the whole affair settled in his mind within a few hours' time. He maps out a route—he plans his work and he sticks to his plan.

To plan work inside is not a bit harder. It simply means sitting down with pencil and paper and giving definite thought to what you want to accomplish. Try it. The most successful dealers are the dealers who go at nothing haphazard, who plan every step. And it will always be so. Are you one of the number?

MAKING SALESROOM FARMERS' HEADQUARTERS IN THE CITY

The ever growing sale of automobiles in agricultural districts suggests many ways by which the live and progressive dealer may draw farm trade to his place of business without any extraordinary expense.

One of the ideas advanced and practised by a Western dealer is to make his place of business a veritable headquarters for farmers. He has a ladies' waiting room where a woman can come in and wait for her husband without feeling that she is in the way. He invites farmers to make free use of his place by leaving packages there; and they use his telephone and blow up their tires and fill their radiators at his place and, incidentally, buy their gasolene and oil and accessories there.

Every day some one drops in and he learns of prospects and gets the gossip of the different districts—all of which he cashes in at a profit.

Where 60 per cent. of your prospects are farmers, it certainly pays to cultivate this trade—and he does it.

No-Sale-No-Commission Sub-Dealer Plan.

One Indiana dealer who has been quite successful in lining up sub-dealers who work and make sales attributes his success to his frank, straightforward policy of "no sale no commission." In other words, his sub-dealers thoroughly understand that when they call on him to make the sale they do not get the commission.

"I tell them that when I furnish the prospect—and when I don't—that I expect them to make the sale if they want the profit. It is cheating to force me to make the sale and then try to grab the profit. If a man is square he must agree with me."

AWAKE-NDISING WORLD

CREATING "BAD TIMES" SALES

Results Which Systematic Work May Accomplish When Others Say "How Quiet!"—Salesman Whose Many Qualities Put Him at Top of List.

Business is largely what you make it.

While one salesman is complaining about the poor times and the astonishing quietness everywhere, another is winning the house record for the best accessory sales ever known.

Why is it?

It is not a matter of territory. Other territories are just as good. Some have more car users in them. That means they are larger. And yet one man outsells 40 others two to one. It is not "conditions." They are the same everywhere. It was application to business. It was the salesman's habit of calling on his trade every day with a cheery, optimistic way of looking at things. His customers were glad to see him. It was his way of going to them with practical suggestions as to how they might increase their business. It was showing them better business methods, where needed, without in any way offending the man by his tactfully put suggestions. It was friendliness. Yes, people do like to do business with someone they consider friendly.

Enthusiastic Belief in His Goods.

It was all these—plus a great many other things—but the greatest things were his enthusiastic belief in his goods and his regular, systematic visits to the trade, rain or shine.

Systematic work tells. The salesman referred to did not know he was beating everybody else. All he knew was that he was doing his very best. When he found he stood first he was delighted, but astonished. He had made business by going after it systematically—by looking for it in the side streets, by seeing opportunities in small stores that competing salesmen neglected. And here he topped a list of 40 when others were saying "How quiet!"

You can do it, too. Try his method. It works in selling automobiles.

BUYERS INTERESTED IN SHOW OF MECHANICAL PARTS OF CAR

There is something wonderfully fascinating about a display of automobile parts. People "like to see the wheels go around" just as much as ever. When you take them over to a table and lift up a highly polished piston and show them how many rings it carries; and how light, yet how strong, is the connecting rod; how simple and efficient the system of lubrication; how smooth and close-grained the material from which it is made they feel that they have really gotten into the vitals of the proposition. Three-bearing crankshafts and all the rest of it are just as seductive as in the earlier days. No matter how much or how little a buyer knows he finds it interesting. It is not only interesting but convincing. But—and here is where many exhibits are lacking—keep the metal parts smooth and polished as they were when they came from the factory. Do not let them become rusty and ancient looking—as they must by constant handling and exposure to the air, unless frequently oiled and carefully looked after.

SALE OF ACCESSORIES MINE OF PROFITS FOR GARAGEMAN

"The garageman who closes his eyes to the profit-possibilities of selling standard accessories of all kinds is deliberately throwing away money and opportunity at the same time." So said an Indiana dealer who sells accessories and makes money on them, too. "The trouble with the average dealer is that he pays no serious attention to the trade-developing side of the accessory and supply business. He simply treats it as a small business not worth looking after. Goods are kept on shelves in dark rooms out of the way. It is hard to find what is wanted. No one knows what is in stock. Things are allowed to get dusty and dirty. Naturally they depreciate in value. They cannot be sold in competition with the bright, clean goods of the merchant who gives the matter whole-hearted attention. In many cases even the dealer himself does not remember what he ordered or received. How can any department of a business make a satisfactory showing under such conditions?

Quantity Buying Gets Right Prices.

"On the other hand, my experience in selling supplies has been exceedingly satisfactory. I stock only standard stuff that I know will sell. I buy in quantities that get me right prices. Careful records are kept of the department. Names of purchasers are secured when possible. We not only make money but our accessory business has been directly responsible for first contact with people who later purchased cars from us. We believe in the accessory and supply end of the business, and it is not guesswork but careful analysis of two years' experience that makes us very sure it pays."

SALESROOM ORNAMENTATION FAST GOING OUT OF STYLE

The use of banners and pictures to decorate salesroom walls is fast going out of style. Dealers are beginning to realize that any object which detracts from the car or attracts attention away from it, is not really intended for the salesroom. An era of neat, plainly decorated salesrooms is in vogue. The salesroom should be merely a setting for the car—planned to focus attention on the car.

Fairs offer unusual opportunities to get in touch with genuine nineteen-fourteen prospects. In some places it is the big chance for the dealer.

"My Best Sale and Why I Regard It as My Best"

Attention to a Prospect Who Was Regarded as "No Good" Which Netted a Sale After Supposedly Better Men Has Passed It Up—Fifteen-Year-Old Boy and Sale He Made Unaided When Prospect Seemed Losing Interest.

By FRANK RALEDNIS, Omaha, Neb.

PERSISTENT AND CAREFUL SALES WORK THAT INDUCED CUSTOMER TO PAY HIGHER PRICE

My definition of Salesmanship is that it is "a science or art of managing any commodity or self, equal in value, excellence or weight, at a fair margin of profit, by a bold, honorable, enterprising, energetic human being," and in relating the following, I want to assure you it is frank and honest.

"Come back after supper, John," called a young man as the dealer and his customer were leaving. "I'll be here, and I want to talk to you."

"All right, we will be back," was the reply.

This dealer and customer had come in from a distance to buy a machine. The sales manager took charge of them upon their arrival, sized them up as "nothing doing" and turned them over to a travelling salesman who had come in from the territory. This salesman likewise gave up the work, and as the 5:30 whistles blew he was endeavoring to get rid of his parties.

It was I who asked the dealer to come back after supper. I knew he could not get a train for his home until 9 o'clock, and I surmised the customer was going to buy and wanted a machine, because my Rule No. 6 said so; Rule No. 6 is "When a dealer brings customers from a distance to your showroom they are 95 per cent. sold. Exert 5 per cent. tactics and you have the order."

I had a faint knowledge of the machine —I knew it was all right—my enthusiasm was great and I had sufficient grit to talk.

Promptly at 7 o'clock appeared the customers and I immediately brought out the subject. They outlined what they wanted and what they were willing to pay. Of course, it was entirely different from our established selling policy. I set about to change their minds. I became personally interested in their affair and considered myself as one of them—we figured together and asked questions.

I took pains to figure according to their ideas, at the same time bringing in point after point in favor of the particular machine at a higher price than what they wanted to pay and the one the sales manager and salesman were selling. We worked conscientiously for an hour and I was beginning to lose ground—they had made a mistake in figuring and, of course, odds were against me. I had made up my mind to cut the price, but just then a switch engine with a heavy load was passing our office and it seemed to say, "It's got to come —it's got to come—it's got to come."

This increased my vigor, my eye caught the error. I reached for the paper on which they had been figuring and rectified the error. It was done. The order was safely tucked away, duly signed and a cash deposit of $100 was joyously conveyed into the vault, ready for the morning's deposit.

From the above experience I laid down my Rule No. 11.

Rule No. 11: "Persistency plus carefulness helps produce orders."

By PHILLIPS, JR., Orlando, Fla.

JUVENILE SALESMAN DEMONSTRATES HIS ABILITY BY RETRIEVING A SALE THAT WAS WANING

I am a boy 15 years of age, and have figured in several sales of our cars. My father was manager of the leading garage here for two years, but they had two salesmen who took care of their sales, so I did not get a chance to sell a single car while there.

My best sale was one of a S—— "35" touring car which we had used about a month before the garage was sold. At that time we decided to sell our car, as we did not like to run a S—— car when we were handling another line.

Father and I went over in an adjoining county and ran across a prospect, who was to let us know the next afternoon if he decided to take it. He agreed to come over on the railroad and drive the car back if he decided to buy it, but he did not show up, so we 'phoned him.

He said that he had decided not to take it. I got the car cleaned up nicely and drove it over to see another prospect close by, but he did not offer me as good a trade as the first party, so I told him that I would let him know later what I would do, and I drove over to see the first party and sold it to him. If I had not shown it the second time, it is perfectly certain that I would not have sold it. Showing the machine was what sold it.

American Car Wins Australian Climb.

It is not often that the driver of any car has the distinction of beating in open competition the drivers of 76 other cars of 64 different makes and representing practically every nation on the globe. And yet that is exactly what an Australian driver of an American National car did in a hill climb that was held near Melbourne, September 13th, and which marked the opening of the Australian season. The driver is Allan Doone and the car is a stock 40-horsepower roadster. The contest is an annual one that is promoted by the Automobile Club of Victoria and the hill measures seven-eighths of a mile in length and has a grade of approximately one in eight. Not only did Doone beat all of the other drivers in the competition, topping the hill in 1:05⅕, and thereby averaging better than 50 miles, but in a later flight he made the ascent in 1:04⅗. His nearest competitor, who drove a 100-horsepower German Opel, required 1:08 for the ascent. Doone's first flight, incidentally, was made to the accompaniment of rain and lightning.

Query. How Fast Can He Travel?

What may be expected from automobiles in the way of speed in the near future is indicated by the fact that the driver of a 300-horsepower Fiat, after making a careful inspection of the Brooklands track, gravely announced that he would not risk his car on that speedway as he did not consider it safe for speeds of more than 125 miles an hour. When last heard from the man of speed was searching for a long, straight road where he could turn his huge machine loose and find out its capacity.

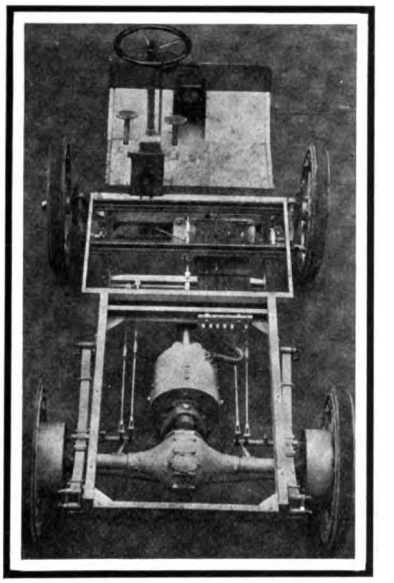
ELECTRICAL SHOW UNCOVERS NEW VEHICLES

Chief Element of Newness Furnished by G.V. and Champion Trucks and Bailey Four-Passenger Touring Model—Battery Makers Well Represented by Standard Wares—Model Garage Attracts Few Spectators.

The Electrical Exposition and Motor Show which was opened in Grand Central Palace on Wednesday, 15th inst., and which will be formally brought to a close on Saturday night, 25th inst., is considerably more of an electrical exposition than it is a motor show. Its seven automobile exhibits scarcely entitle the show to the designation "greatest ever" as a vehicle show—last year



CORNER OF SHOW WITH NEW BAILEY TOURING MODEL IN FOREGROUND

11 vehicle makers displayed their wares—but the seven nevertheless are representative of a good deal that really is new. There is a brand new light General Vehicle delivery wagon; the Bailey company has permitted the show lights to shine on its new four-passenger touring car; and the Henry Tobin company has uncovered a light delivery wagon incorporating a new method of transmitting the power from the electric motor to the road wheels.

But whatever the show lacks in vehicle exhibits it assuredly makes up for in other eye-filling spectables, what with electric toasters and percolators and irons and chicken hatchers, to say nothing at all of a small section of cow stable, a part of the United States Mint and other Government exhibits.

From the tiny and white and antiseptically clean and sweet-smelling section of cow stable it is but a step to a model dairy where milk is turned (literally, with the aid of a centrifugal separator) into cream, and a hop, step and a jump further there is the entrance to the model electric garage. On three occasions, the main room of the garage, which is but a section of the spacious floor enclosed in corrugated sheet iron, contained as many as three vehicles, three charging panels and a profusion of Electrical Exposition and Motor Show posters. Add to the main room a much smaller one labeled washing room and containing nothing more than an overhead washing device, a slightly larger adjoining room containing enough storage batteries for half a dozen vehicles and a third room containing several pieces of garage machinery, not in operation, and several types of Shaler electric tire vulcanizers, in operation, and the model garage is complete. Its most striking feature is its broad expanse of floor space and, though there is always some one in one of the four rooms to explain the mysteries of the charging apparatus and other apparatus, there never is any jostling of crowds between the galvanized walls. One attendant is sufficient to answer the questions of those who hanker after further information than that disclosed by a view through the open doors.

On the main floor, where all the electric vehicles are disposed, the space occupied by the General Vehicle Co. is directly at the head of the marble stairs leading to the exposition floor, though even if it were in a less conspicuous location it is doubtful if it would fail to attract attention, for it holds one of the really new things of the show. The new vehicle is one of a type

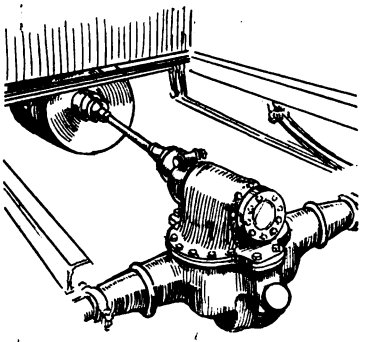
CHAMPION CHASSIS SHOWING DRIVE

that marks a radical departure from previous General Vehicle practice for the simple reason that it incorporates shaft drive to the rear axle through the intermediary of worm gearing; the worm is mounted above the ring gear. The capacity of the new vehicle is 1,000 pounds, and its most conspicuous difference from its predecessors is that it carries its battery in front of the driver under a sharply slanting hood which suggests not a little gasolene vehicle construction.

The setting of the vehicle itself is a clever one and the object of the "stage manager" to show the successive stages of evolution through which the General electrics have passed since the year 1901 has been very ably accomplished. Flanking the new vehicle, there is one of the original G. V. types which has the double motor pinion drive and at the other side there is another vehicle of the same general type except that

Digitized by Google

it is six years younger and instead of the double motor pinion drive has a single motor chain drive.



In the larger G. V. trucks a number of improvements have been made, not the least important of which is the adoption of a new type of controller box which is formed of sheet steel and therefore is completely fireproof; incidentally, it carries a new three-way running switch of the drum type which permits the operator to "kill" the truck while it is unattended. Another safety device that has been added is a cut-off switch which makes it impossible for the truck to be started while it is being charged, and also permits workmen to adjust the controller while the charging operation is in progress. The other more important alterations embrace the adoption of rigid conduit containers for all the wiring; the location of a plug receptacle for a portable lamp on the driver's heelboard; the adoption of grease cups for the spring shackle bolts; the addition of a sheet steel tool box under the rear of the vehicle; and the provision of emergency brakes on the vehicles of from two to five tons capacity.

At the space where G. M. C. trucks hold forth there is what appears at first glance to be a complete three-ton vehicle loaded to the "gunwales" with potted plants. Closer inspection, however, reveals that as far as the body is concerned at least, it is but half a truck. The chassis is complete, and and searchers for construction that is new might as well pass it by, for it is the same truck that basked under the light of the incandescents at the last electrical show. But the body construction is novel; from one side it is a complete body; from the other it is half a body with all the intricacies of construction laid bare.

Hard by, a massive Couple-Gear converted horse-drawn truck rears its elevated hood, under which a placard conveys the information that "We use drivers, not chauffeurs," the intimation, clearly borne out by the vehicle, being that the operation of the truck is simple enough for even the thickest skulled truck driver to grasp easily. The construction is not new, of course, though it is none the less suggestive of the economy of converting horse-drawn trucks into power drawn ones with the aid of a pair of Couple-Gear wheels and a battery.

Scarcely more complicated, despite the fact that it is a complete electric delivery wagon from stem to stern, the Champion, which is displayed by the Henry Tobin Co., of New York City, reveals drive construction that is new, not only to itself but new in its field as well. The vehicle itself is of 1,000 pounds capacity—it is made to carry 750 pounds, too—and is equipped with a single motor rigidly bolted to the rear axle construction and so pivoted at the forward end that the maximum of flexibility is obtained. The drive is direct through a double herringbone gear, the smaller pinion being mounted on the armature shaft. The larger pinion is direct connected to the driving gear at the differential mechanism, making plain the simplicity of the construction. In the larger-sized vehicle the battery equipment consists of 42 cells of 11-plate Hycap or 60 cells of Edison A-4; in the smaller one the battery consists of 24 cells of 15-plate lead or 48 cells of Edison A-4. The wheelbase in both models is 84 inches, the larger model having 32 x 3 tires and the smaller one 32 x 2½ tires.

In the single 2½-ton stripped chassis that serves as a demonstrating model for the salesmen of the Ward Motor Vehicle Co., there is nothing that is radical in construction, considering previous Ward trucks, and little that is really new, the designers evidently being satisfied to let well enough alone. One new feature that is calculated to put an end to no end of annoyance is the enclosure of all wiring in solid metal conduits.

G. V. WORM DRIVE MOUNTING

In pleasure cars, the four-passenger touring car that has been brought out by the S. R. Bailey Co. and that is exhibited side by side with the older and better known Bailey runabouts, is the newest thing on wheels, and except for the fact that it is slightly smaller and slightly lower than a gasolene car, might easily be mistaken for one. As far as the transmission elements of the car are concerned, they are no different from those in the roadster and these in turn scarcely have been changed at all since last they were displayed to the gaze of the curious. The new car has a roomy body in which four big passengers would not feel cramped. The battery, of course, is larger than that supplied with the roadster models and consists of 60 cells of Edison A-6, which, it is calculated, is plenty to propel the car from 90 to 100 miles on a single charge. The car sells for $3,300.

The only other exponent of the electric pleasure car is the Standard, which is exhibited by the Elizabeth Automobile Co. of the New Jersey town for which it is named. The car that represents the Standard line is a coupe model with accommodations for four passengers, the driver's seat being at the rear, though its position is no hindrance to unobstructed view of the road both before and behind.

As far as the accessory exhibitors are concerned—if those who display wares other than vehicles may be so styled—the battery makers are very much in evidence, though none of them have anything that is really new. At the Edison display, there are Edison batteries, of course, and the new vibrating rectifier that last year made its initial appearance. The Electric Storage Battery Co. has an extensive exhibit of its Exide batteries set off by illuminated transparencies showing the wide applicability of the battery in various businesses; the piece de resistance of the Philadelphia Storage Battery Co.'s exhibit are the thin plate cells for which the name Philadelphia is well known; Gould batteries are shown in all their various types and in a new type which has been developed especially for central station work and therefore is of more interest to power engineers than to dealers.

In other fields, the H. W. Johns-Manville Co. has an extensive and comprehensive exhibit in which automobile accessories have an important place, and the same may be said for the Westinghouse and General Electric companies. The Manhattan Electrical Supply Co., whose Mesco products are well enough known to need no introduction, has an illuminated dry cell exhibit and a single exhibit of ball bearings, made by the Rhineland Machine Works, serves to make plain that while the automobile industry is one of the largest users of such anti-friction devices, other industries as well use great quantities of them.

The complete list of exhibitors who display wares intimately or remotely connected with the automobile industry is as follows: Albert and J. M. Anderson Mfg. Co., Boston, Mass.; S. R. Bailey & Co., Boston, Mass.; Edison Storage Battery Co., Orange, N. J.; Electric Storage Battery Co., Philadelphia, Pa.; Elizabeth Automobile Co., Elizabeth, N. J.; General Electric Co., Schenectady, N. Y.; General Motors Truck Co., Detroit, Mich.; General Vehicle Co., Long Island City, N. Y.; Gould Storage Battery Co, New York City; H. W. Johns-Manville Co., New York City; Manhattan Electrical Supply Co., New York City; Philadelphia Storage Battery Co., Philadelphia, Pa.; Rhineland Machine Works, New Britain, Conn.; Clarence L. Smith Co., New York City; Wagner Electric Mfg. Co., St. Louis, Mo.; Henry Tobin Co., New York City; Ward Motor Vehicle Co., New York City; Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

THE DIFFERENCE BETWEEN SYSTEM AND RED TAPE

Reilly Explains How a System Which Handicaps a Business Is Not Efficiency—He and the Sales Manager Untangle the Tape That Tied Up a Nearly Finished Car—Instances of Inefficiency.

"That's all right, Jim, but, goldarn it!" and Reilly thumped the Sales Manager's desk with his fist, "that man wants to start on a tour tomorrow and he wants that car——"

"HE MONKEYED AROUND MAKING THE SALE OF THAT BOLT FIT HIS SYSTEM"

"Won't he wait a day or two?"

"It isn't that," asserted Reilly, hitching further forward in his chair and giving his hat a push further back on his head, "I told him he could have it today and——"

"Well," interrupted the Sales Manager, "if he's got to have it——. I didn't know it was such a rush job——"

"What's the matter with it? Why isn't it ready?" demanded Reilly.

Ascertaining Why the Car Was Delayed.

"I don't know; let's go out and see; it was coming through on schedule; something must have happened to it," and suiting the word the Sales Manager reached for his hat and, with Reilly, started for the Final Assembly floor to see why a car with special upholstery was not ready for the owner who wished to start an autumnal vacation tour on the morrow.

Down the long line of cars they went, each one moving slowly, step by step, toward the other end of the floor; when a car reached the door it was supposed to be ready to go out. Both men watched the line, but there was nothing which looked like special upholstery.

"Must have gone out," remarked Reilly. "No—isn't that it?" He pointed to a car which had been rolled over out of the line.

"As sure as tire trouble!" exclaimed the Sales Manager, inspecting the tag which hung on the windshield.

"What's the matter with this car?" both asked in unison as the assembly foreman approached.

"IF HE HAD STUCK TO SYSTEM THAT CAR WOULD HAVE BEEN TIED UP TWO DAYS"

"Somebody kicked all the paint off that hind wheel on the other side," he explained, leading them around the car where they could see that one wheel was missing.

"Where's the wheel?" asked Reilly.

"Up in the Paint Shop."

"When'll it be done?"

"Couple of days more."

The foreman looked at the Sales Manager, the Sales Manager looked at Reilly, Reilly looked at the empty axle and no one said anything. Finally Reilly uttered a subdued "Hell!" Then his face brightened.

"I've got it! The color's standard; why not take a wheel off of one of those cars that won't be this far down the line for a couple of days?"

The foreman shrugged his shoulders.

"Yes! Why not?" agreed the Sales Manager.

Getting an Inside Glimpse of System.

"Can't be done," answered the foreman.

"Can't! I could do it myself!" exclaimed Reilly.

"Anybody could do it, so far as the mere doing is concerned," said the foreman, "but it's contrary to the system."

"What's the system?" This from the Sales Manager.

"It's like this: A car starts in at one end of the Final Assembly line and moves from station to station; when it gets to this end it is supposed to be ready to go out for final inspection and test. When something happens like this the only thing to be done is to push the car to one side and wait for the wheel, for if we take a wheel off some other car it robs this other car of its rights according to the system."

"But if the other car got here before the

Digitized by Google

wheel was ready, couldn't you rob another tail-ender in the line and keep the whole line moving in that way?" asked Reilly.

"You could—but not according to the system," replied the foreman.

The three were still gazing in silence and pondering on the problem when the Old Man walked in the door from the factory yard. He stopped at sight of the thoughtful group. "Now what?"

The Old Man Effects a Quick Solution.

The trio told him of the dilemma, and as the situation was made clear the Old Man looked at Reilly with a curious little smile. "Get 'em a wheel, Bill; get 'em a wheel," he said to the foreman, patting the back of that individual's jumper.

When the car was rolled down the gangway fifteen minutes later Reilly and the Sales Manager followed it and watched operations as a yard man filled the "gas" tank and ran the car across the card to the corner where the Final Inspector did his work and could be found when he wasn't taking a little run around the block. At this particular moment he was on "a run around the block."

"Who's the father of that system?" inquired Reilly while the two waited for the Final Inspector's return.

"Search me; I don't know much about it. Some system, though, isn't it?"

"I should say it was, more or less. It's a wonder the Old Man doesn't 'can' it. I don't believe he inaugurated it."

"No, I don't believe he did," replied the Sales Manager. "He's stronger on results than he is on system."

Excess of System Worse Than None.

"System is all right," continued Reilly, "but too much system is a handicap. Take that instance this morning. What a simple little thing it was to get that car off the floor, and yet if the foreman had stuck to the system the car would have been tied up for a couple of days yet. And all the time the owner would have been fretting and fuming—and so would I. That car represents too much money—for the factory, the owner and myself—to be made the victim of such a nonsensical arrangement."

"But you've got to have some system," argued the Sales Manager.

"Certainly you have; I'll admit that," replied Reilly, "but red tape isn't system. A business that is encumbered with an overdose of system needs a good, vigorous man to take a hand and straighten things out. There used to be a supply store down home that died from an overdose of system. You notice I say 'used to be,' for it is a 'used to be.' The man who ran it was a chap named Casson and he needed some sort of system, for he was the darndest scatter-brain that ever happened. He couldn't run a barber-shop and keep his cash straight.

"He opened a supply store and, with the assistance of a few efficient employes, managed to get along fairly well until he got the system bug; the bug bit him hard. He became wildly enthusiastic over systems and grabbed at them all; I was in there one day and he started in explaining his systems, and it made me dizzy. He had more kinds of blanks and double and triple duplicates and indexes and cross-indexes than I ever believed existed, and he had filing cabinets all over the place. I asked him how the business was going. He said, 'Good.' I asked him how the system worked, and he said 'Fine! Great!'

"WHAT YOU ORDERED REQUIRES FORM 23—YOU USED 25"

"If a man wanted to buy a nut or a bolt, that cost maybe three cents, the clerk had to make out a blank to which there were several duplicates attached, and he monkeyed around till hell froze over making the sale of that nut conform to the system.

"A great many good stores have their clerks make out checks for sales and it seems to work all right. I can't exactly explain the difference, but Casson's system was wound around the business like ticker tape in one of these cartoons of a busted stock broker."

"Don't you have any system in your place?"

Example of Governmental Inefficiency.

"To be sure I do!" replied Reilly, uneasily sliding the brake lever back and forth on the ratchet. "But I do considerable business on the side. I don't let the system monopolize my time and energy. Any man has to have some kind of system to keep things straight, but there isn't any necessity for letting it become a bugbear.

"I read something pretty good in some paper the other day. It was about the red tape of our Federal government, which is an excellent example of why system does not connote efficiency. A young doctor was sent to Cuba during the Spanish-American war and he found hospitals with men in bad shape from wounds, typhoid and yellow fever. There was a shortage of quinine and other medicines and there were no dressings, so he hurried a demand to Washington for the necessary supplies. He was a very anxious man while he waited for the return of the ship with the stuff he had ordered. He was much relieved when the vessel arrived, but instead of supplies he got a letter which said, 'What you ordered requires Form 23 and you have written the requisition on Form 25. Please make the order out again on the correct form and send it to us so we can fill the order.'"

"Well?" demanded the Sales Manager. "How would you do it?"

Dealer Applies Point to Own Business.

"I'm not an efficiency expert and don't pretend to be," replied the dealer, "but I'll bet I could figure out some better plan than that; any dealer or manufacturer needs some way of knowing the head and tail of his business, but what I object to is permitting it to degenerate into pure red tape. I could make my salesman write out a long report on what happened every time he saw a prospect, submit the report to me, I could make a notation on the prospect filing card, file the report and tangle things up unnecessarily. But when the salesman sees a prospect, all I ask is that he make a brief notation on the filed card."

"Here he comes now," said the Sales Manager as the Final Inspector drove into the yard in the car he was inspecting.

"Can you look this car over now?" asked the Sales Manager.

"This one? Not now," replied the inspector. "I have to take them in order as they come down from the Final Assembly."

"But you can look it over and Reilly'll do the rest, can't you?"

Reilly Takes System Bull by Horns.

"No, honest I can't. I'd like to, but I have to go by the system and make out blanks, and so forth; it's quite a job."

"But I'll do the little road test; all you need to do is give it a once over on the outside," volunteered Reilly. "This car is promised today and I want to take it back."

"I'm sorry; but according to the system——"

"Oh, you and your system go to h——!" exclaimed Reilly, as he climbed into the car and threw on the starter.

The Sales Manager was still smiling and the Final Inspector was still agape as the dealer, in passing out through the gate, stepped on the cut-out as an expression of his opinion.

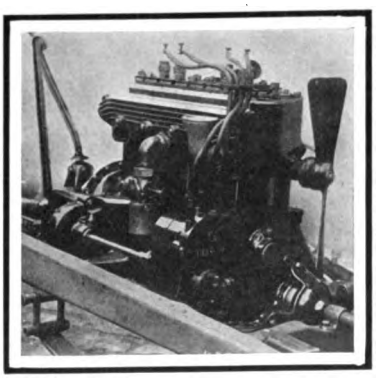
BRISCOE'S FIRST PRODUCTS REVEAL NOTHING RADICAL

Touring Model and Cyclecar Are Both Well Standardized Fours—Will Appear Simultaneously Here and in France.



Their plans and their production having progressed to the point where at least two cars have materialized from the ideas carried to France more than a year ago by the Briscoe brothers, Benjamin and Frank, details of the two cars that will monopolize the activities of Briscoe Freres, of 30 Rue du Point du Jour, Billancourt, Seine, France, at length are available and they reveal little or nothing that is radical in construction and a modicum of American standardization.

As yet, the two cars, one of which is a five-passenger touring car carrying a 16-horsepower motor and the other is a cyclecar pure and simple, have not formally made their appearance on the market, and not until after a sizable factory, which already is being equipped, has been completed, will they do so. It is expected that the factory will be ready for operation about the first of the new year, when production of an initial batch of 6,000 cars will be commenced. At the same time, production of the cars in an American factory also will be commenced, though just where the factory will be located has not been disclosed. It is certain, at any rate, that it will be a Briscoe Freres factory, and that the American production of Briscoe cars will not be turned over to some other American company already formed or to be formed. The Billancourt factory and the one to be operated somewhere in the United States will be under the same management. In the meantime, Briscoe Freres's American affairs are being directed from a temporary office located at 7 East 42d street in New York City. This will be closed when the American factory becomes a fact.

Following the expressed intentions of the Briscoe brothers to produce cars incorporating what to Briscoe eyes is considered to be the best of foreign practice together with the best of American practice, the two cars that will go to make up the line are decidedly Frenchy in appearance, though in construction they exemplify the simplicity that always is such a prominent distinguishing mark between the majority of foreign cars and American cars. The larger of the two cars, as already has been made plain, is a five-passenger vehicle with a roomy body carried on semi-elliptic springs both front and rear. Throughout the construction great attention has been paid the necessity for lightness, and to this end chrome vanadium and other alloy steels have been used very considerably.

BRISCOE CYCLECAR WHICH WILL SELL FOR $390, AND THE TOURING MODEL LISTING AT $900

MAGNETO SIDE BRISCOE MOTOR

The motor is a block casting with all of its movable parts enclosed after the latest American practice. The bore and stroke measure 80 x 130 mm, which approximates to 3 5/16 x 5¼ inches, making plain that the designers have taken a leaf of the foreign book of rules which at present palpably favors the small bore high speed motor. Though the nominal rating of the engine is only about 17 horsepower, it is claimed to actually deliver as much as 32 horsepower on the brake at 1,800 revolutions a minute. Valves are all located on the one side and are operated by adjustable tappets with fiber heads to reduce noise.

The cylinder block and crankcase casting is a single piece with the base of the crank member, which serves only as the oil reservoir, formed of a steel stamping held in place by a series of bolts. The crankshaft, which measures 1⅞ inches in diameter, is carried in two long, plain bearings. Cooling is by thermo-siphonic action, assisted by a large radiator and a two-bladed fan of the aeroplane type driven from the crankshaft by a flat belt. Ignition is effected by a high-tension Briscoe magneto mounted at the left side, as shown by the accompanying picture. Lubrication is carried on by pump circulation and, by way of increasing simplicity, external piping has been reduced to a minimum.

The engine is mounted on three suspension points, two arms virtually encircling the flywheel being at the rear and attaching directly to an unusually compact three-speed selectively operated gearset. Control levers are placed centrally and the steering wheel may be at either the right or the left side. Final drive is by means of a long propeller shaft, contained within a torque tube, to a bevel gear rear axle of the full-floating type. For the present, the selective type of sliding gears will be used for the transmission of power, though it is planned eventually in the larger car to use a new type of hydraulic change speed mechanism which will eliminate all gears and greatly simplify control.

The wheelbase of the car is 105 inches and it is carried on wire wheels shod with 30 x 3½-inch tires both front and rear. The car is to sell for about $900 with complete equipment, including electric lights fed from a storage battery, top, windshield,

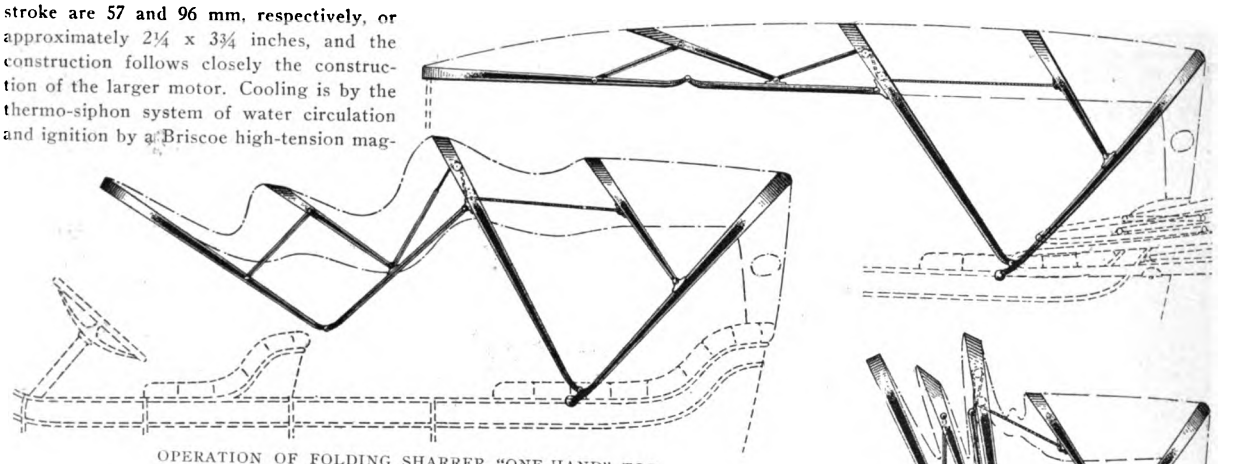
Digitized by Google

tires and speedometer. The weight of the car complete is to be 980 pounds.

The cyclecar, which will be marketed under the name Ajax, is materially different from the larger car in that it has all the attributes of the little vehicles in its class, including friction transmission of power and single chain drive. The body, as may be seen by the accompanying illustration, which shows one of the first experimental cars turned out, seats only two passengers and allows plenty of room for "luggage" at the rear.

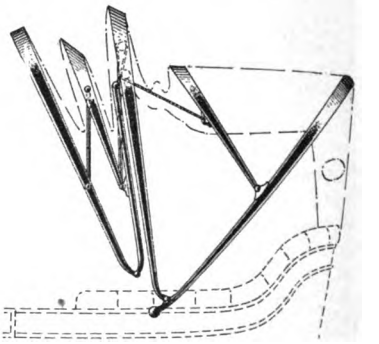
The motor is an unusually compact four-cylinder machine with detachable cylinder heads, and, needless to add, its four cylinders are cast in a block. The bore and the stroke are 57 and 96 mm, respectively, or approximately 2¼ x 3¾ inches, and the construction follows closely the construction of the larger motor. Cooling is by the thermo-siphon system of water circulation and ignition by a Briscoe high-tension magneto. As with the larger motor, the intake piping is incorporated with the exhaust, so as to provide warm gas to the cylinders; lubrication is carried on by a pump.

For the transmission of power the usual friction disks and single chain to the solid rear axle are used, the differential mechanism being eliminated as unnecessary. The rear suspension of the car is an interesting type of cantilever, the short front arm of which is carried downwards and holds the radius rod. The front of the chassis is supported on full elliptic springs of the usual type. Detachable wire wheels fitted with 650 x 65 mm. tires are part of the standard equipment, which will be listed with the car at the price of $390.



First California Tire Shipped Eastward.

Marking an epoch in the tire industry, the Savage Tire Co., of San Diego, Cal., has shipped a carload of its tires to the Colorado Savage Tire Co., of Denver, which has been organized in that city by Chauncey W. Hauser and Lawrence Sullenberger. The order is the product of the factory in San Diego and is the first eastward shipment ever made of tires manufactured on the Pacific Coast.

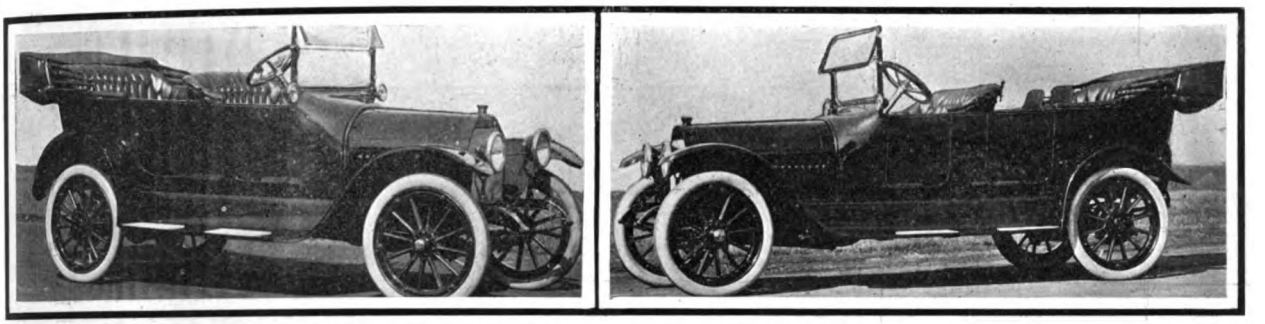


ONLY ONE HAND REQUIRED TO MANAGE SHARRER'S TOP

Flexible Cable Support that Prevents Sagging and Adds Strength—Forward Section Supported Without Side Frames.

An automobile top is a covering for protection against the elements—a covering that can be pushed back out of the way when not needed. But a top is something else, too. It is a paint-scratching, finger-pinching, temper-taxing, time-taking device, or it is—well, it is more or less lacking in those most undesirable qualities, according to the way it is designed and constructed. According to the people who make it, the Sharrer top, which is but just making its appearance on the market, is totally lacking in all qualities it should not have, and possesses just the good points that a top needs. And the accompanying illustrations show that there is more in the opinion expressed by the Sharrer Patent Top Co., Inc., of 245 West 55th street, New York, than can be accounted for by mere pride of possession.

OPERATION OF FOLDING SHARRER "ONE-HAND" TOP



FINAL FOLDING STAGE

The top is attached to the car at one point only—that is, one point on each side of the car—and that is at the rear seat. When the top is extended the rear half is carried by the two main bows, which are supported by steel tubing frames extending forward and backward at an angle from the point of attachment to the car, and by an intermediate bow attached to the rear main frame. The forward extension has a frame around its edge with a hinge about the middle of its length. A bow hinged to the forward frame-work gives support to the forward fabric and it is braced, as shown, by short rods. The feature that makes this form of construction possible, however, is a flexible cable attached to the intermediate bow of the rear half of the top, running over two pullies on the forward main bow and thence to the bow of the forward extension. The cable, which is invisible, gives the top the support it needs when extended, taking the extra strain off the fabric, and also prevents the frame from falling and scratching paint and bothering occupants of the car when being folded or opened.

When the forward straps or other means of attachment to the top of the windshield or the front end of the car, as the case may be, are loosened, the top can be pushed back with one hand, supporting its own weight all the way back and finally folding compactly and with the fabric neatly disposed between the frames so that the boot or dust-cover is easily slipped on. The opening process is equally simple, and for this reason the makers state that the top not only can be opened or closed with one hand by a man, but by a child, for that matter.

The framework of the Sharrer top is of steel tubing and straight grained ash, and is finished in any desired way. The fabric is waterproof mohair, cravenette or pantasote and both back and side curtains have celluloid windows. Either Jiffy or Collins curtains can be used. The method of suspending part of the weight on cables results in a light construction, so that the Sharrer top weighs but little, comparatively speaking, though it is extremely rigid and has no side sway. It is made to fit any size or style of body.

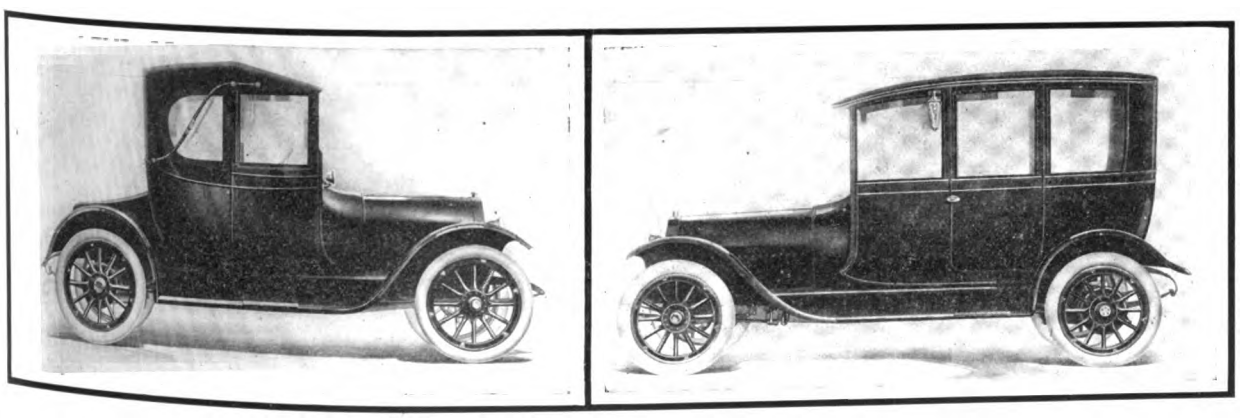
FOUR-CYLINDER STUDEBAKER LISTING AT $1,050, AND THE "SIX" WHICH SELLS FOR $1,575

TWO STUDEBAKER CARS TAKE PLACE OF THREE

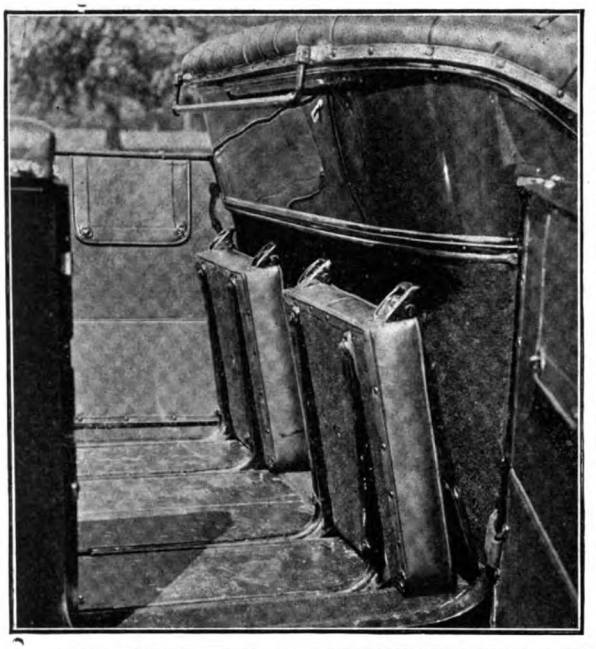


Larger of the Two "Fours" Dropped and Smaller One Practically Rebuilt But Without Radical Change—Electrical Equipment Added—Left Drive For Both Four- and Six-Cylinder Models—Other Refinements.

When, about a year ago—in November last, to be exact—the Studebaker Corporation of Detroit, Mich., very radically reconstructed its line and brought forth two new four-cylinder models and a "six" that since has proven all that its engineers hoped for it, it was not to be expected, in view of the very thorough manner in which the line was revamped, that other material changes would be forthcoming for some little time. And now that the revisions of the newly revised line have been made public, it is revealed that the premise was a perfectly logical one. For though the line has again been very considerably revised and only the memory of the larger of the two four-cylinder models remains as one of the results, the revision does not by any means amount to a reconstruction, as was the case last year, and instead is confined to the adoption of a number of unmistakeable improvements that bring the two remaining cars more than ever up to the last minute in design and construction.

Coincident with the improvements that have been made, most prominent of which to the eye is the shifting of the steering gear to the left side and the control elements to the center, the adoption of slightly tapering engine hoods, and bodies that are streamline in effect as well as in appearance, the prices of the two cars have been increased, though the increase no more than compensates for the equipment that has been added. The "four," for instance, now lists at $1,050 instead of $885, but it is a larger car in nearly every respect and now has a complete electric lighting and engine starting system, which it never had before; the increase in the price of the "six" is a nominal $25—the old price was $1,550—in spite of the fact that it has all the improvements that characterize the "four"; it always had complete electrical equipment, however.

Bodies, hereafter, will be confined to three types, including touring models quite as a matter of course. The Sedan, too, has been retained and the third body is an unusually attractive one which may be on occasion either a conventional roadster or in effect a coupe, completely enclosed but without the disadvantage of the usual coupe body which is apparent in its weight. The new model is styled a Landau-Roadster and its picture, which is reproduced herewith, conveys a better idea of its appearance and construction than could all the words in old Noah Webster's famous volume. The touring models are made in two sizes only, the "four" carrying five passengers and the "six" providing accommodations for seven passengers. The Roadster-Landau on the six-cylinder chassis has plenty of room for three persons, and the same type of body on the "four" chassis is identical except that it is slightly smaller.



In revising their line, Studebaker engineers very evidently have paid quite as much attention to bodies as they have to the more or less hidden parts of the chassis, and as a result they have all the little

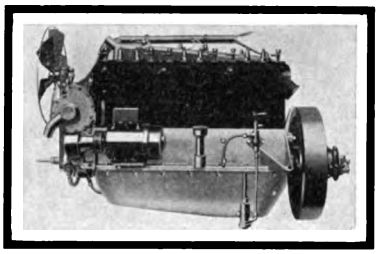
UPPER LEFT—STUDEBAKER FOLDING TONNEAU SEATS. UPPER RIGHT—GROUPING OF DASHBOARD INSTRUMENTS. LOWER LEFT—NEW CLUTCH AND LUBRICATION METHOD. LOWER RIGHT—ENGINE SHOWING STARTER MOUNTING

kinks and wrinkles that mean so much to the dealer as talking points and to the owner as comfort points. In the first place, bodies are roomier than they have been, and in full recognition of one of the principal advantages of left-side control, entrance to the driver's compartment from that side is quite unobstructed, a feature to which clear running boards contribute in no small way; spare tires are carried at the back of the tonneau. Entrance to the tonneau also has been made easier by the adoption of full U-shaped doors, and it goes without saying that upholstery and the shape and position of the seats have received such attention as may have been necessary to render them still more comfortable.

One little feature of tonneau construction which will serve as an apt illustration of the thorough manner in which the comfort of passengers has been examined is revealed in the manner of disposing of the auxiliary seats. When they are not in use, they fold neatly into a recess in the back of the front seat, instead of pivoting against the sides of the tonneau and the knees of those who ride in it. In the driver's compartment control has been facilitated by a clever grouping of the Stewart speedometer, the electric indicator dial and the sight feed of the oiling system. Not only are they thus brought simultaneously in the vision of the driver, but a single, hooded incandescent serves to illuminate all three. This unit, by the way, is mounted in a rather deep cowl which serves to house the gasolene tank after the manner that steadily is growing in popularity. The construction, needless to point out, provides for a short, straight feed to the carburetter by gravity, and at the same time permits the lowering of the front seats without danger of necessitating reduction of fuel capacity to obtain the same result.

Allowing for the necessary difference in wheelbase length and in the size of essential parts in the two chasses, they are practically identical, so that a description of one, therefore, will serve for both. In the matter of spring suspension, however, there is an important difference in construction. Under the rear of the four-cylinder chassis there are full-elliptic springs in which the

Digitized by Google

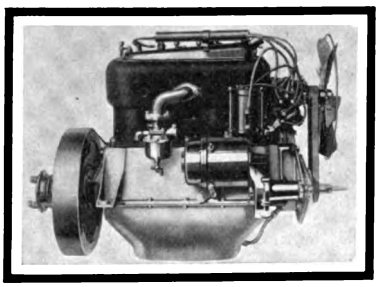


under members are hung beneath the axle, thus providing for a low-hung chassis. In the "six," the rear springs are of the three-quarter elliptic type, as has been the case in the past. The front suspension in both chassis embraces the conventional semi-elliptic members.

To start at the beginning of the chassis and work backward, both motors have their cylinders cast in a rigid block and in both cases the bore and stroke measure 3½ inches and 5 inches, respectively. Except for two or three deviations from past practice, the motors have not been altered and present their original compact appearance with the water pump and the magneto driven from a transverse shaft in front. The first difference concerns the pistons, which now have flat tops instead of the domed tops they had at first. Repeated experiments, it is given out, have demonstrated the superiority of the flat top piston over the other, and as a result Studebaker engineers have not been slow to adopt them. Instead of turning on the cast iron bearing of the piston bosses, wrist pins now turn in bronze bushings, allowing for adjustment and replacement.

The other alteration is a more extensive one and is embraced in a complete revamping of the electric lighting and engine starting system which, instead of being included in a single unit, has been split into two units, which are separately mounted and driven. Under the new plan, the generator is placed on the left side of the motor and is noiselessly driven by a shaft and pinion in mesh with the camshaft gear. The starting motor is at the right side and is connected to the engine through the intermediary of a roller clutch and a chain. A single pinion gear reduction, encased within the unit, together with the chain and sprockets, permits a gear reduction of about 20 to 1. Current for starting and for the lamps is drawn from a six-volt Willard battery that is hung to the chassis frame. The charging operation commences when the car speed reaches 10 miles an hour and is at its maximum when car speed is 20 miles an hour.

Due to the employment of a simple overrunning roller clutch between the electric motor and the engine, there are no gears to shift for starting and, as the electric motor and its connections become stationary immediately the starting current is turned off, the system is practically noiseless. Both the generating and cranking units are made to Studebaker specifications by the Wagner electric company of St. Louis. Adoption of the new starting and lighting system, or, rather, the development of the old one into a new one of greater efficiency, has resulted in a change in ignition methods, too. Instead of a magneto, there is now a simple Remy distributer and coil, current being drawn from the main storage battery. Mixture is supplied by a Studebaker-Schebler carburetter and, as heretofore, the cooling water is circulated through the system by means of a pump.



Further along on the chassis, the clutch, which remains of the cone type, shows a number of improvements, and in both models its size has been slightly increased. Instead of bearing simply on a shoulder, it now moves by the engagement of two

EXHAUST SIDE STUDEBAKER "SIX"

grooves and rings, and lubrication is supplied from a grease cup on the H-plate communicating with the bearing by means of a flexible steel tube. Gearsets remain the same and provide three forward speeds and reverse, the unit in each case being rear axle mounted after the usual Studebaker practice.

Another change in the four-cylinder model that is calculated to increase efficiency and to reduce up-keep expense lies in the substitution of a full-floating rear axle for the semi-floating design that has been used in the past; the four-cylinder model and the "six" now are exactly alike,

INTAKE SIDE STUDEBAKER "FOUR"

as far as their axles are concerned, for in the "six" this member always has been full-floating. Brakes, too, have been slightly altered and both sets now are equalized through rods extending through slots in the frame. The wheelbase of the "four" measures 108 inches and of the "six" 121 inches, the former dimension representing an increase of six inches. Wheel dimensions in the "six" remain unchanged, all four wheels being shod with 34 x 4 Goodrich tires carried on Booth demountable rims; in the case of the "four," however, the wheel sizes have been increased from 30 x 3½ to 32 x 3½.

In the matter of equipment, there is very little to be desired, the list in each case including demountable rims, Stewart speedometer, electric lighting and engine starting system, electric horn, silk-mohair top with Jiffy curtains and envelope, adjustable windshield and a complete set of tools, spare parts and a tire repair kit.

Welding that Requires Caution.

Electric or oxy-acetylene welding not infrequently is suggested as an additional safeguard against trouble when a breakage has occurred and has been repaired by some purely mechanical method, such as bolting the parts together. While welding may, and will, prove beneficial in many cases, it sometimes may result in warping or, possibly, injury to the metal, and before the work is carried out there should be an understanding as to whether or not there is any risk of this sort.

Protecting Storage Battery Terminals.

Old suggestions often are as good as new ones; and in view of the increasing number of electric lighting, starting, horn-blowing, gear-shifting and other installations requiring storage batteries, there is much to be gained by remembering that battery terminals and leads, well cleaned and then smeared with vaseline, will resist corrosion where unprotected metal will disappear rapidly under the active action of the acid solution.

Draining the Gasolene Filter.

A good way to make sure that the gasolene filter is drained at least as often as it should be is to use it when gasolene is required for washing a spark plug or any such purpose. Of course, there are many cases where this is the obvious, if not the only way; but there are others where there is a more convenient draincock that may cause the drain on the filter to be neglected.

Simple Emergency Compression Relief.

The cranking of a big motor that is difficult to start can be greatly facilitated by inserting bits of sheet metal under the valve stems to partly relieve the compression, taking care, however, that the lift is not increased sufficiently to cause the valves to strike when they go up and either break or bend.

"Gassing" that is Destructive.

The less "gassing" there is when a battery is being charged the less wear there will be on the active material on the plates. Excessive gassing dislodges the material and proportionately shortens the life of the plates, the material being wasted.

AMATEURS DEFEAT "PROS" IN CHICAGO RELIABILITY

Rain Causes 18 Entrants to Dwindle to Three Starters, of Whom One Forms Trade "Team"—Much Mud Makes Going Hard.

The amateur team of the Chicago Motor Club overwhelmingly defeated the Trade team of the same organization in the two-day reliability run that brought them together during Friday and Saturday, 17th and 18th insts., and though the total score was 190 to 2, its size serves as no indication of the number of drivers on each team. George Spangle at the wheel of a Midland was the sole representative of the Trade, and but two cars, a Ford, piloted by F. J. Meyer, and a Cole, driven by L. W. Owen, completed the amateur team. These three drivers were the only ones who competed for the A. J. Banta trophy over a slippery, sloppy route that led the tourists out to Sulphur Springs and back.

Of course, it was planned that a great many more than three competitors should at least start in the contest, and because only these three came to the starting line quite a few Chicago motorists are more than ordinarily free with the expression "cold feet." The whole trouble was that it rained torrents the day before the date scheduled for the start, and as a result only three entrants had the courage to face the roads which their own experience proved to be in truly terrible condition.

Those on the original trade team who backed out at the last moment were W. E. Stalnaker (Premier), Thomas J. Hay (Hupmobile), Harry C. Watts (Renault), Charles E. Gregory (Chalmers), H. N. Fowler (Ford), and J. G. Tennant (Abbott-Detroit). The members of the amateur team who failed to put in an appearance at the starting line were Reed L. Parker (Stearns-Knight), J. S. Patterson (Midland), Geo. A. Lillig (Stearns), George Knabe (Pierce-Arrow), Owen O'Malley (Rambler), Chas. M. Reynolds (Locomobile) and E. M. Porter (Haynes).

On the outbound run to Sulphur Springs the "going" was particularly hard; it was so hard in fact that it was long after the noon hour before the trio of hardy tourists reached the end of their 80-mile jaunt. Despite this fact, however, both Spangle and Meyer completed the first leg without incurring penalty. Owen was not so lucky, and a motor stall resulted in the two points penalty chalked up against his team. During the return journey, Spangle, on whom those of the trade team who did not essay the trip had pinned their hope, was compelled to make a long stop because of some sort of ignition trouble, for which he was debited the 190 points that stand against his team.

That the result of the run will sound the death knell of contests promoted by the Chicago Motor Club is the expressed opinion of not a few intimately connected with club affairs, for, it is pointed out, the lack of interest reached its culmination in the practical abandonment by the members of the Trade vs. Amateur run.

More World's Records Made at Brooklands.

Those 11 world's records that Hancock set up on the Brooklands track in England on September 18th are world's records no longer. In a successful assault on both the 1,000-mile and the 12-hour records, Chassagne, Resta and K. Lee Guinness, who took turns driving a Sunbeam car on October 1st, set up new figures for the ones established by Hancock, 1,000 miles being covered in 11:06:38.87, which is at the almost incredible speed of 90 miles an hour.

The new 12-hour record is 1,078 miles 460 yards, which is at the rate of 89.95 miles an hour; the old 1,000-mile record was made with an Argyll car and stood at 13:05:57.68, which figures out at 76.36 miles an hour, and the old 12-hour record, made with the same car, was 914 miles 604 yards, which is at the rate of 76.2 miles an hour. It is worthy of mention that the new 12-hour record is ahead of the best existing record for 14 hours by more than six miles. The car with which the new records were made has six cylinders measuring 80 x 149.6 mm., or 3 5/32 x 5¾ inches, and is rated at but 23.8 horsepower, according to the British formula. The new records, which are better than the old ones by as much as three miles an hour at the start and some 13 miles an hour at the finish, are as follows:

Two hours, 195 miles 189 yards; three hours, 287 miles 856 yards; four hours, 380 miles 628 yards; five hours, 473 miles 464 yards; six hours, 566 miles 589 yards; seven hours, 653 miles 147 yards; eight hours, 748 miles 247 yards; nine hours, 840 miles 1,533 yards; ten hours, 910 miles 969 yards; eleven hours, 989 miles 828 yards; twelve hours, 1,078 miles 460 yards; 1,000 miles, 11:06:38.87.

Cyclecar Reliability Contest Abandoned.

That cyclecar reliability tour that was to have been promoted by the Chicago Motor Club and would have led the tourists around Lake Michigan commencing Monday, 20th inst., has shared the fate of Around-Lake-Michigan tour for full-fledged cars; it has been called off. The reason for its abandonment is given out as lack of entries, only four owners having signified their intention of inaugurating the sport.

MUD HAMPERS DISBROW IN SHORTENED ST. LOUIS MEET

Wet Track Causes Abandonment of Half of Program and Prevents Establishment of Records—Takes Two of Six Events.

J. Alexander Sloan—the name being practically synonymous for Disbrow, Heinemann, Hearne and Endicott—invaded that part of St. Louis, Mo., in the immediate vicinity of the Maxwelton mile dirt track on Sunday, 19th inst., and, unusual to relate, every existing world's record remains intact. But it was neither Sloan's fault nor the fault of Disbrow, Heinemann, Hearne and Endicott, that no new figures were set up. It was the fault of the track, which was sloppy because of the superabundance of rain which had made necessary the abandonment of Saturday's meet. It was so sloppy, in fact, that Sloan called off the first three numbers of the program, leaving six, and of the six Disbrow only took two.

But after all, the glory was pretty well spread around, for Heinemann got his two races and so did Endicott, though the best that Hearne could do was a couple of seconds. As usual, Disbrow essayed a mile flight and completed it with his Simplex in 58.61, which is pretty fast considering the condition of the track. Heinemann took both the five- and three-mile races, Endicott got the Australian pursuit race and the so-called novelty race, from which nearly all the novelty had been rubbed, and Disbrow took both the handicap event and the five-mile heavy car race. The summary:

Five miles, class C, 231-300 inches—Won by L. Heinemann (Case); second, T. Milton, Jr. (Mercer); third, H. Ullbrecht (Case). Time, 7:20.11.

Three miles, class E, under 450 inches—Won by Heinemann; second, H. Hearne (Case); third, W. Endicott (Case). Time, 5:08.75.

Five miles, class E, under 600 inches—Won by Disbrow (Simplex; second, Gus. Monkmeier (Staver-Chicago); third, Endicott. Time, 5:32.20.

Australian Pursuit race—Won by Endicott (four miles); second, Ullbrecht; third, Heinemann. Time, 4:58.54.

Novelty race, three miles (two miles run, wheel changed, and third mile run)—Won by Endicott; second, Hearne. Time, 3:58.15.

Three miles, free-for-all handicap—Won by Disbrow; second, Endicott; third, Monkmeier. Time, 3:04.37.

One mile time trial by Disbrow. Time, 58.61 seconds.

BEATING THE HARDWARE MAN AT HIS OWN GAME

Accessory House Which Keeps Its Customers from Buying Accessories in the Hardware Store by Stocking "Automobile Hardware"—Principles Which Underlie the Invasion of the Rival Trade.

The boy in the Little Lord Fauntleroy suit never dreamed of the come-back when he sought to amuse himself by slapping the plebian lad in the eye. But when the plebian child returned the favor that was—well, it was contrary to Hoyle, as the young aristocrat understood the book.

Of course, the analogy isn't perfect, perhaps, but something of the same thing is happening and is likely to happen to a still large extent in the accessory and hardware trade. In these cases the hardware man may be said to have delivered the first slap, which the accessory man is in a way to return in full measure.

Problem of Competing with Hardwareman.

For some time it has been emphasized by those who are familiar with conditions in the automobile trade that the hardware man has, in a measure, "got the jump" on the automobile trade in the handling of accessories and has taken a considerable business that should by rights remain in the hands of automobile dealers, garagemen and accessory stores. How to regain the lost foothold has been a problem for those who have been desirous of preventing the inroads of the hardware dealer upon the accessory trade.

For many dealers and garagemen the problem is still as acute as ever, but in the metropolitan accessory trade there is one concern which has been combatting the hardware man with his own weapon, which has been beating him at his own game, and with resultant profit to itself and immeasurable satisfaction and convenience to its customers. This is the Auto Supply Co., of Broadway and West 59th street, of which the head is George H. Robertson, who is not yet forgotten as the winner of the 1908 Vanderbilt Cup Race. Robertson's fame as a racing driver is not his only asset, for the real success of the supply company is due to its being operated in a businesslike manner, and to this also may be attributed the adoption of hardware as a feature of the enterprise.

This company realized long ago that the hardware man was quite likely to take up accessories and that if he did so the regular accessory and supply houses would suffer; the problem was and is how to keep the hardware man from taking a slice of the accessory trade, and this supply company decided that it was by living up to its trade motto, "Everything Pertaining to Automobiles." The course of reasoning was that if the car owner was to be kept out of the hardware store it must be made possible for him to buy anything he needed in the accessory store, and the result was that the Auto Supply Co. immediately began to add hardware to its stock.

Stock Has Grown as Demand Increased.

The accessory stock has always been kept complete and the hardware stock has grown in proportion as the trade has become educated to the fact that it does not have to go to the hardware man to buy automobile hardware and has learned to ask for what it wants in the accessory store. Today a car owner can go to the Auto Supply Co. and buy anything he needs in the accessory line, practically anything in the automobile hardware line, and can select from an assortment of motoring clothing that is more complete than is carried in many out-and-out clothing stores. The stock is selected upon the principle that it is policy to have everything the motorist wants—caps, robes, gloves, cushions, coats, all accessories and everything he is likely to require in hardware from nuts to bar steel and bronze.

Briefly expressed, the theory is this: The motorist needs certain articles of hardware. If he goes to a hardware store for them he may buy accessories there, too. If he can get anything he wants in the accessory store there is little likelihood of his ever going near the hardware store, wherefore the accessory man will get all he is entitled to—and then some.

Harvey Adams, vice-president of the supply company, who has been in a measure responsible for the growth of the business, makes plain the extent to which any other dealer may pick a few hardware plums when he describes the development and operation of the business.

Business Now in Three Departments.

"We began putting in hardware seven years ago," he said, "and put in but a small stock at first, but now we run the store in three separate departments—sundries, hardware and clothing—and the former takes up the entire basement. We were further down Broadway in those days, and while we carried what we considered a good stock of accessories we paid little attention to hardware as we stock it today. When a man wanted anything in that line we sent him to a hardware dealer or sent a boy after it.

"This demand by our customers was the beginning of our hardware business. There is a quantity of such goods which is required by car owners and garagemen, and since these people were in our store so much we wondered why it wouldn't be well to stock the wares for them instead of turning this trade away. We began by putting in those things for which we had the greatest demand and added to the stock as other demands arose, until we can furnish nearly anything that is called for.

"To the man who is going into this busi-

Digitized by Google

ness on an extensive scale, an essential is, I should say, a capable hardware man as the head of the department. It is not enough to leave it in the hands of an accessory man if the business assumes any considerable scope, for accessories are one thing and hardware is another. The average hardware man or salesman will not fill the bill, for the trade in an accessory store should be handled in a manner which is not characteristic of the other line of business.

Delays Encountered in Hardware Store.

"I had this brought home to me when we were sending our customers outside for the things we didn't have. We would send a boy to a hardware store a couple of blocks away and he would be gone what seemed an unnecessarily long time. Finally I decided to go myself and see if I couldn't make the trip as quickly as I thought the boys ought to. I went to a hardware store one day and asked for what I wanted. Before I asked for it I had to wait until a clerk got ready to wait on me, and he didn't seem to care whether I got what I was after that week or next.

"After I gave him the order he shouted up a dumbwaiter to have it sent down from somewhere upstairs. The man upstairs certainly cared less about how long I had to wait than did the clerk, and I was rather impatient by the time the order was filled. I never said much to the boys after that when they were longer than I thought they ought to be. When we first began to stock hardware it consisted largely of hammers, pliers and things of that sort which any man is likely to want to use, and the department at that time didn't require any one man's whole time.

"But as it grew and became more extensive we felt the need of a real hardware man to put in charge of the department and we cast about for one. My experience in that one store was enough to convince me that an ordinary hardware man was not what we wanted, but we finally found one who possessed the proper qualities of salesmanship and who knew hardware."

Stock Includes All Motorist Needs.

No genuine hardware store could look more like an establishment of that kind than does the basement of the Robertson quarters, where almost anything is obtainable. One class of goods consists of nuts, bolts, screws and such articles, and the assortment of styles and sizes is complete. Drawer after drawer is filled with them. Over in one corner are saws, hammers, and those tools which often come in handy or are a necessity in the care of a car. Grease cups, valves and similar parts occupy another section, while another part is devoted to oil and gasolene cans, funnels and pails.

"But we are adding to the stock all the time," explained the manager. "If we get one call for something we don't stock it, but if the call is repeated and there seems to be a demand, we put it in. That is how we have accumulated the entire stock.

"It will surprise you, the number of articles that are sold merely because the car owner happens to see them when he is buying something else. He may have come in to get a couple of bolts, and while he is here he may see a display of drills. That reminds him that he wanted a drill badly the other day, so he buys a drill. Maybe he notices a pile of canned paint or varnish or the stock of brushes; he often is made to remember that he has had it in mind for a long time to touch up a few spots on his car, so he buys a can of paint and a brush. There are countless things of that description which are sold in that way."

Displaying Wares Helps Their Selling.

Why they often are sold in this manner is not difficult to see when one visits the hardware store in the basement; it is operated on the same principle which is advantageous in any retail business—that of putting goods where the customer can see them. The paint brushes are kept in a cabinet of drawers and are arranged according to sizes, but upon the outside of each drawer is fastened a sample of the brushes which are inside. This not only enables the salesman to put his hand on the right drawer without studying the label, but it places the wares out into full view of the visitor to the store. Neither does it take extra space.

Many articles, such as S wrenches, are attached to a display board which carries a full set from the smallest to the largest size. The man who wants a wrench doesn't have to guess at what he wants; he can put his finger on the exact size with certainty. These boards are used also for window display; they are easily portable, and when they have served their turn in a show window are taken back to the basement and hung upon the wall to resume their duties as silent salesmen.

With such a variety of stock as this it is comprehensible why a hardware man is needed to manage the department, and it also is not difficult to understand that he must likewise have an understanding of automobiles. If a car owner visits the hardware department and asks for a piece of tubing for his gas lighting line, the ordinary hardware man might not select the size with readiness, but the hardware-accessory man—who is essentially a new and coming species—knows offhand just about what the car owner needs. The same thing applies with cooling system hose and many other things.

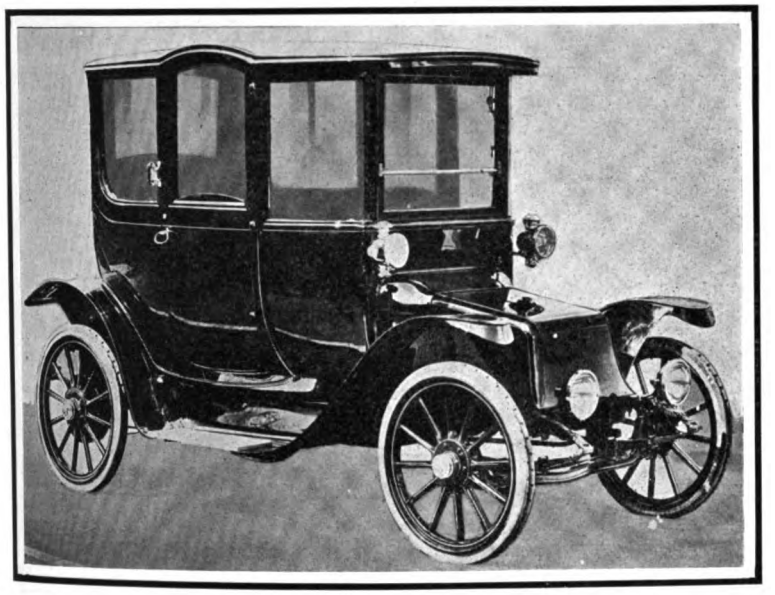
The display windows are a feature which make the Automobile Supply Co. well known in the metropolis; an expansive front extends along the Columbus Circle side and is devoted mostly to hardware and accessories, while the Broadway side, a smaller space, generally is devoted to a seasonable exhibit of motoring clothes—hats, caps, gloves, robes, coats and other warm and cosy-looking apparel.

Accessory Business on Up-to-Date Plan.

The feature of the Columbus Circle side during the past week has been a moving exhibit advertising Weed chains. It is one of several advertising "stunts" secured by the Weed Chain Tire Grip Co. in a window trimming contest it recently promoted and consists of a "rag man" on a skeleton chassis which slides and skids as a little electric motor does its work. The Automobile Supply Co. recently produced the "Safety" window suggested in Motor World of August 21, which called the motorist's attention to the need of safety for his car and the many devices which have been designed to aid him in achieving that end.

The accessory department, which is on the street floor, and is, of course, the main portion of the business, shows further adherence to the motto, "Everything Pertaining to Automobiles," in its offering of such wares as Thermos bottles, cushions, picnic lunch outfits and other things which the car owner wants and might go elsewhere for if he didn't see them displayed in his favorite accessory store. The stock of clothing is especially complete, and aside from his suits the motorist can find anything he requires. Probably one thing which causes customers to come back a second time is the sales service; prompt treatment is insisted upon and no one is allowed to wander at large without receiving attention from a salesman.

Suggests Electric Heater for Cars.



The store even has two counter mirrors for the benefit of women customers. In discussing the accessory trade in general Adams ventured the suggestion—which is free to anyone who cares to consider it—that there is a demand for an electric heater or foot warmer, easily attachable and selling at a reasonably low price. At present the most satisfactory device, he stated, is the charcoal warmer for tonneaus and closed cars. But with so much electrifying of cars, he said he believed a heater which could be connected by the mere insertion of a plug in a connection would prove popular if it didn't cost too much. He carried his suggestion still further and said he thought it would be well to consult first with the generator and battery makers as to whether present electrical systems would carry such a warmer.

LIMOUSINE MODELS ONLY IN CHICAGO ELECTRICS

Method of Slinging Battery Improves Appearance and Riding Qualities —Cars Have Slow Speed Motors and Direct Drive.

Recognition of the fact that the electric is particularly well adapted to city work under all sorts of conditions and in all sorts of weather, has caused the Chicago Electric Motor Car Co., of Chicago, to adhere to its practice of building only enclosed models —vehicles, however, that can be so thrown open by the lowering of windows as to afford ample opportunity for the play of the breeze in warm weather, while the roof shuts out the beating sun. Three models are built on two chassis that are alike except in the matter of wheelbase, one having a measurement of 96 inches between the axle centers and the other 104 inches.

CHICAGO ELECTRIC LIMOUSINE SHOWING ARCHED ROOF

The longer chassis is used for model 142, which is built for five passengers and is of the limousine type. The rear seat is 54 inches wide and easily accommodates three passengers, while the driver occupies a single Pullman type seat on the left side, in front of the main seat and in line with the middle of the door. The fifth passenger is carried on a folding seat at the right of the driving chair. Both doors can be used for entrance and exit, the seating arrangements being such that the doors are not blocked. The interior body length is 78 inches. The steering has been so worked out that the car can be turned completely around in a street 38 feet wide—a matter of importance in city work, where space for making turns often is at a premium.

Model 141 is on the short wheelbase chassis and, aside from its length, differs from the other car chiefly in the matter of seating arrangement; like the model 143, it carries five passengers. The rear seat for three passengers is 53 inches wide and the driver sits on the left end. The other two passengers occupy a front seat facing backward; this seat is 45 inches wide and 20 inches deep. It is intended that in heavy traffic, or under any circumstances in which the driver's work is difficult, the seat directly in front of the driver shall be left vacant, so that his vision will not be interfered with. The interior length of the body is 70 inches. The 96-inch wheelbase makes possible a turn in a 34-foot street. Model 143 is similar to model 141 except that the right front seat is a revolving chair, so that the occupant can turn in any direction. Otherwise the specifications are the same.

The general characteristics of the bodies are the same in all models. There is no high battery box in the rear. The battery, which consists of 40 cells, 11 plates, MV Exide, is divided, there being 20 cells in the rear and 20 cells in front. All the battery weight is carried between the axles, there being no battery weight over the axles. The extremely low placing of the battery brings the center of gravity very low, and the battery boxes are out of sight, though the cells are accessible.

Over the doors the roof is arched; and this not only looks well and gives extra headroom when entering or leaving the car, but in rainy weather the water drains off to the sides and does not drip at the doors. All body panels are of aluminum and the framing is of hard wood. The mouldings are of what is known as the full belted variety and permanent aluminum deck drains are provided.

In the construction of the chassis all work is done with a view to the use of solid rubber tires; steels are selected and the springs designed with this object. The framing at the sides is of pressed steel, unusually wide and 4 1/16 inches deep, and there are no less than eight heavy cross members stiffened and braced by gusset plates. The rear axle is a Timken, full-floating and roller-bearing throughout; the I-beam front axle is of the same make. As to the springing, it goes without saying that it is about as perfect as it is possible to make it; the construction of the car as a whole lends itself well to the good springing.

The motor is a Westinghouse, slow speed, series wound, and is direct connected to the rear axle by a straight line drive with propeller shaft and double universal joints; there is no gear or chain reduction between the motor and the rear axle drive. The slow speed motor is said to possess advantages in hill climbing, and its low speed also has a beneficial effect in the matter of bearing wear, commutator life and so on. The controller also is a Westinghouse product and provides for five speeds forward and reverse. A magnetic blow-out is installed. All contact surfaces are large and the wiring throughout is heavy. As the controller is very close to the motor the wiring is short and is accessible through the flooring. No resistances are used; all speeds are running speeds, and the successive controller positions give 5, 8, 15, 18 and 22 miles an hour.

The control lever and the steering lever are horizontal; the controller lever can be locked with a Yale lock. One ratchet lever operates the brake and an emergency electric cut-off and there is also a foot brake, without ratchet. The reverse cannot be thrown in until the brake has been applied. The brakes proper consist of internal expanding shoes on the rear hubs 14 x 2½ inches, and a 10-inch drum on the propeller shaft. On all models the wheels are 36 inches in diameter front and rear, with 4-inch dual tread clincher tires. The tread in all models is of the usual standard width, 56 inches.

Valve Stems that Cause Squeaks.

A source of squeaking that is rather common with a good many motors of not the latest type is a dry valve stem, most likely to occur on the exhaust side. Such a squeak often is hard to locate exactly, but a little prodding around with an oilcan while the motor is running will quickly stop it by lubricating the dry places.

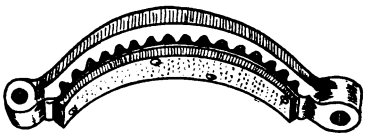
FORD WAGE SCALE REVISED; PAYROLL INCREASED 13%

New Classification of Operators Responsible for "Raises" Given Practically Every Workman—A Grading System Adopted.

Due to the adoption of a new wage scale, growing out of the institution of a grading system, the wages of practically all employes in the Ford Motor Co., in Detroit, have been increased, the total representing a 13 per cent. enlargement of the company's payroll.

As explained by John R. Lee, who made a study of the subject in a number of the large industrial plants in this country, where there were originally six general grades of labor in the Ford establishment, three subdivisions have been outlined in each general grade.

"As an illustration, in our so-called 'C' grade, we classify all machine operators and car assemblers," says Lee in explaining the new system. "As a subdivision in 'C' grade we have beginners, those just starting to work. Men entering our employ in this grade all receive the same wage. As soon as the man has demonstrated his ability and becomes an operator of average proficiency, it is expected that his foreman will advance his wage by a certain fixed sum and his skill rating to 'C2,' and again after the man has advanced from an operator of average ability to a first-class workman another raise in pay is given him and his skill rating advanced to 'C1.' There is a still further subdivision in the two grades (B and C), which include approximately 80 per cent. of our help, and this grade is a grade or rather a rate of wage paid on account of long service. An employe who has been with the company two years or more, and is a first-class workman, receives special consideration for his service over and above the wage paid for a first-class workman in his grade.



"In place of the very large number of rates that were paid throughout the shop, we will use under the new plan but eight different amounts, ranging from a minimum of 26 cents for ordinary laborers to 54 cents for skilled mechanics, and in each general grade and subdivision thereof a certain fixed rate applies, which may not be deviated from."

Kirkham Takes up Cyclecar Engines.

The Kirkham Motor Mfg. Co., of Bath, N. Y., has added a cyclecar engine to its productions. It is of a two-cylinder, 30-degree, air-cooled, four-cycle, V-type, having a stroke and bore of 3 inches and developing 9 horsepower on the block. It utilizes mechanical valves and it may drive either by a belt on each side of the crankcase or can be used with a clutch integral with the flywheel; or for friction drive the flywheel is employed as one of the friction disks. The engine is equipped with a special Kirkham timer with the idea of dispensing with the magneto and bringing the price within reasonable bounds.

To Increase Life of Brake Lining.

Where there is friction there must be heat, and if there is a good deal of friction and no provision is made to get rid of the heat, trouble is a strong probability. In the case of automobile brakes, there is a great deal of friction when the brakes are in use, and as there is not, as a rule, any means for disposing of the heat otherwise than by natural and slow radiation, the friction material suffers and its life is shortened. Such, at least, is the position taken by a foreign

FERODO BRAKE LINING

concern that has brought out a radiation device which is shown in the accompanying illustration and is styled "Ferodo."

Under the friction material there is a band of steel about 3/16 inch thick, and between the steel band and the outer band there is a strip of thin steel having transverse corrugations. The metal conducts the heat, and the air circulating freely between the corrugations carries it away. It is stated that the radiating device increases the life of the friction material 130 per cent., while the resilient corrugated backing improved the brake action.

Holt "Caterpillar" Wins Contest.

The annual tractor contest recently held at Magdalene, Argentine, was a triumph for American machines, which took the first four prizes, while a French tractor took the fifth. The prizes were well worth competing for; the first, which was taken by a 60-horsepower Holt caterpillar, built by the Holt Mfg. Co., of Stockton, Cal., and Peoria, Ill., was $15,000, the second $10,000 and the third $5,000. The contest was held under the direction of the Argentine government. The Holt machine also won the Russian tractor contest at St. Petersburg.

Effect of Benzole in Cork Floats.

It has been found that benzole has the effect of causing cork to swell, so that in carburetters using benzole it is necessary to use metal floats.

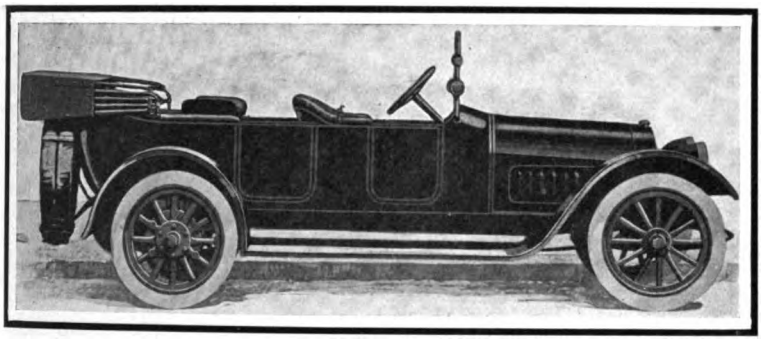
NEW YORK-CHICAGO TRIP UNDERTAKEN BY ELECTRIC

Battery-driven Roadster Expected to Finish in a Week—Charging Arranged for in Advance—Fast Run Made from Boston.

Long distance runs under electric power apparently have the effect of creating a desire for more of the same thing. At any rate, the recent run of 258 miles—from Boston to Burlington, Vt.—made by a Bailey electric roadster driven by Col. E. W. M. Bailey, as stated in Motor World of October 9, was followed by a trip from Boston to New York made in a single day and at an average speed of 21½ miles an hour. This, however, was merely a sort of prelude to a really ambitious tour, for on Sunday last, October 19, Bailey and his faithful roadster started from New York bound for Chicago, and if it is found possible to adhere to the schedule arranged the windy settlement should be reached on Saturday, October 25.

It is expected that the car will average from 120 to 190 miles a day, according to road and other conditions. In accordance with Bailey's expressed opposition to the idea of making the longest possible runs on a single charge, the battery will be replenished at every point where recharging is needed and where current for the purpose is available. Arrangements for charging have been made in advance, as far as possible, and of course the facilities for this work will have a very material effect on the success of the tour. Poughkeepsie will be the first stop for current, while Rochester is scheduled to be passed on the second day, the route leading through Buffalo and to Erie for the night stop. It is planned to reach Cleveland on Wednesday, Toledo on Thursday, South Bend on Friday and Chicago on Saturday. Night letters announcing the progress made are to be sent to the automobile department of the electrical show at Grand Central Palace.

This Car Has a Dozen Cylinders.



The latest Sunbeam racing machine is a 12-cylinder car rated at 47 horsepower, and that its multitudinous cylinders manage to pull at least fairly well together is indicated by the speed the machine attained on the Brooklands track. In a handicap race of 8½ miles, the "twelve apostles" pulled the car along at an average speed of better than 110 miles an hour, and the speed on the stretches is said to have been 120 miles an hour. The motor was not at that time properly tuned up, so that even more speed is expected.

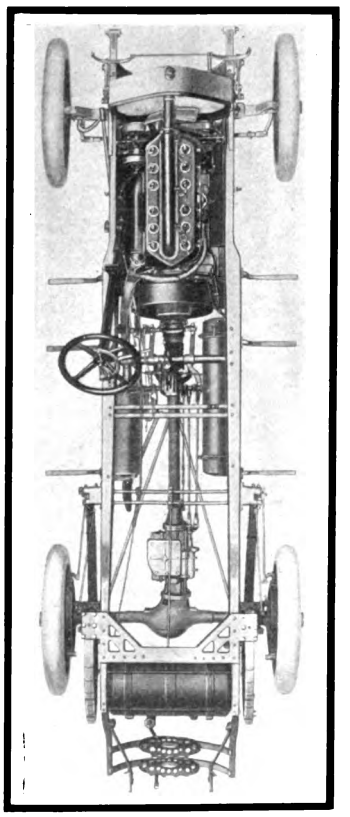
LEFT STEERING ADOPTED ON LATEST McFARLAN "SIX"

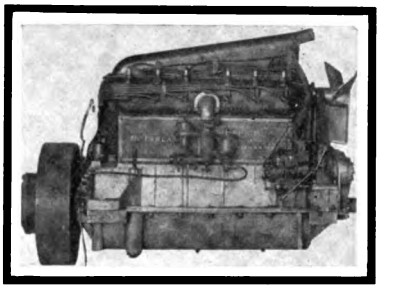
Single Chassis in Newest "Series"—Seven Body Types Mounted—Compressed Air System Improved and Retained.



When a manufacturer of automobiles so far settles his mechanical problems that he anticipates no radical changes—barring the coming of some engineering upheaval that will turn the present order of things topsy-turvy—he usually has also settled upon a characteristic outward appearance that distinguishes his car from the cars of other makers, and, under the circumstances, if he is wise he will depart from that individuality of appearance as little as possible in order that as his car has been known, so it will continue to be known. And this evidently is the way the situation is viewed by the McFarlan Motor Car Co., of Connersville, Ind., for though numerous detail improvements have been made, the characteristic features have been retained and anyone who knows the McFarlan "six" of the last series will know the "six" of the new series.

SIX-PASSENGER McFARLAN "SIX" SHOWING SLOPING HOOD

The word "series" must be used with reference to bodies so far as the latest McFarlans are concerned, for there is but one chassis—there were three previously, all "sixes"—on which seven bodies are mounted. The McFarlan people have selected all that was best in all the older chasses and worked them into the latest model, as far as possible, together with such good things as have been added recently to the long list of mechanical helps to pleasant motoring.



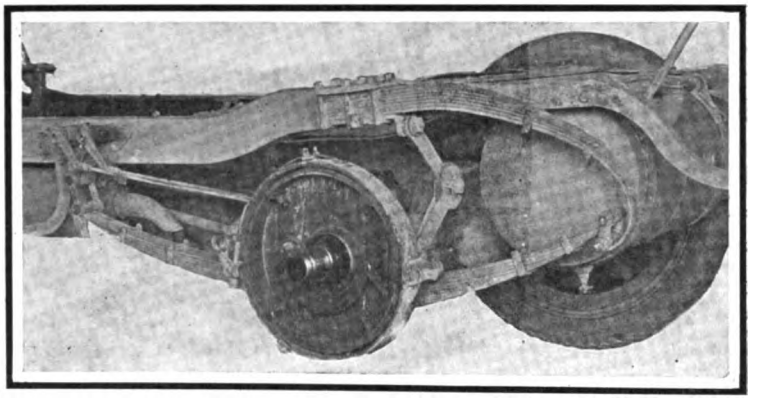
The fact that the McFarlan car heretofore has been steered from the right side and that its builders were strong advocates of that arrangement, makes it reasonably clear that there must be extremely good reasons for left steering, for now the steering wheel has been moved across the car: the levers are centrally placed, as before. Aside from this, perhaps the most momentous change in the car is the adoption of three-quarter scroll elliptic springs in place of full ellipticts, and their clipping under the axle—that is, underslung—instead of above. The lower half of the spring is 56 inches long, which means that the car is easy riding, assuming that the springs are as long on quality as they are on longitudinal measurement—which is a safe assumption. Hartford shock absorbers are fitted, with their arms extending transversely—that is, in the plane of the axle rather than in the plane of the springs. The front hanger of the rear spring is formed integrally with the casting that carries the bearing for the brake cross shaft.

McFARLAN "SIX" CHASSIS

while the end of the half spring on the top is clipped to a lateral extension of a heavy steel plate that extends clear across the frame and serves as a big, strong gusset and brace. The front springs are semi-elliptics, and are over-slung.

The driver of the new McFarlan car has no excuse for ill-adjusted brakes, for they can be adjusted while standing by the car. It is not even necessary to stoop down to get at the rods, for there is a little door in each mudguard that gives access to the parts as well as to the front hanger of the rear spring. The brake toggles have been redesigned to give the bands an even pressure all around the drums; the rods are short and stout and not liable to break.

INTAKE SIDE OF MOTOR



The McFarlan car is equipped with an electric lighting system with a motor-driven generator for furnishing the required current. The generator, the size of which has been increased in the latest model, is "a big, husky instrument," to use the words of the makers, and now runs at crankshaft speed. It is coupled to the shaft that drives the water pump. But though the car has an electric lighting system, it has no electric starter. It is a crankless car, however, for it has a compressed air starter of the two-unit type, there being a four-cylinder air pump—of new design—and a separate air motor. Air is stored in a tank under a maximum pressure of 150 pounds to the square inch and is sent to the cylinders through a rotary distributer that works on the same principle as an ignition distributer, except that there are ports instead of contacts. A button on the dash controls the starting system. The pump is thrown into driving connection with the engine by hand when the air gauge on the dashboard shows that the pressure in the tank—which, incidentally, is larger than formerly—is getting low.

The pump is automatically lubricated by the same system that lubricates the motor, and so requires no special attention in this respect. Air pump and generator are mounted together on a single bracket, which is removable. Thus either of these machines can be gotten at without difficulty, while their removal leaves the water pump acces-

Digitized by Google

sible. And the ball coupling between the generator and air pump cannot get out of alignment. Another improvement consists in replacing the mechanical governor formerly used to regulate the output of the generator with a magnetic governor that is said to require no lubrication and no attention to keep it in proper condition.

Then there are other improvements. There is a new radiator suspension, the radiator being hung on trunnions instead of being bolted to the cross member of the frame. Steering has been made easier, from a muscular point of view, by the employment of ball-bearing steering knuckles. The magneto is a Mea. The windshield is of the built-in type and requires no auxiliary supporting devices—it is self-supporting, so to speak—and further, the top straps attach to the windshield instead of being carried down to the front of the car.

McFARLAN REAR CONSTRUCTION SHOWING SPRINGS AND FUEL TANK SUPPORT

The motor has its cylinders cast in a single block; it is of the T-head type and its smooth, clean design is due largely to the fact that the intake and exhaust manifolds are partly cast with cylinders, so that a lot of external piping is not required. Similarly, the water manifold is a single piece bolted to the top of the motor. All the valve stems are enclosed. The magneto and carburetter are on the right side and the air pump, electric lighting dynamo and water pump on the left and in line, the air pump at the rear and the others in the order named. A big, flexible tube carries the exhaust to the muffler, and troubles due to vibration at this point are eliminated. The motor is hung on a three-point suspension with the single point at the front.

As for the general lay-out of the car, it has undergone no change, as a bird's-eye view of the chassis shows. The multiple disk clutch runs in a casing built into the flywheel and operates in oil. The angularity of the enclosed propeller shaft is taken care of by Spicer universal joints. Bolted to the rear axle casing is the gearset. In the last series, in which there were three models, two had the gearcase in the rearward position and one had a unit power plant; now the rear axle location is standard. The gasolene tank, at the rear of the frame, is cylindrical instead of having the oblong cross-section that characterized some of the older machines. The air tank, having nearly double the capacity of the oil tank, retains its position on the right side of the chassis, under the frame.

A slight slope to the hood modifies the angle between the hood and the cowl and improves the general appearance of the car not a little. All the bodies have been made larger than on previous models, and a new four-passenger coupe body, of which the McFarlan people are quite proud, has been added. No side- or dash-lights are fitted to the cars of the new series; instead, there are double-filament headlights. The instrument equipment is mounted, in modern fashion, on an instrument board under the rear edge of the cowl. The outfit of the car includes Collins "one-minute" curtains and, of course, the usual equipment of things that are considered necessary to the enjoyment of a car of up-to-date design and construction.

Rushmore Starter Develops 375-Pound Pull.

As an indication of the power developed by some of the modern types of electric engine starters, and of the energy absorbed by them in developing it, statistics just made public by the Rushmore Dynamo Works of Plainfield, N. J., are of more than passing interest. Attached to a four-cylinder Simplex engine having cylinder dimensions of 4⅞ x 6½ inches and compression pressure of 85 pounds, a Rushmore starter "spins" the gasolene engine under ordinary room temperature conditions at the rate of 100 revolutions a minute with the throttle at its maximum opening, and during a test continued to maintain this speed for a period of 45 minutes on a standard 6-volt, 120-ampere-hour storage battery. During the operation, the electric motor consumed current at the rate of 90 amperes with the voltage at 5.6. The Rushmore starter was attached to the engine through the usual gearing on the flywheel and with the usual 1¾-inch armature pinion developed a pull of 27.4 pounds which, considering the gear reduction, is equal to a pull of about 375 pounds at the flywheel rim. The electric motor itself, however, weighs but one ounce over 30 pounds.

Proposes Public Double-Decked Garage.

After a subway garage was recommended as a solution of Chicago's parking problem the suggestion was taken up in Detroit, but the project never took definite form; now a semi-submerged double-decked garage is proposed by F. G. Baxter, an architect, who would have his proposed structures erected in certain public squares and available boulevard spaces.

His suggestion is a double-decked, ornamental parking place in Cadillac square, replacing the present waste that is used principally as a resting place for bums, and possibly in Washington boulevard, Grand Circus park and other downtown breathing spots.

"The structure I propose would consist of two stands, one six feet below the street level and the other six or seven feet above," said Mr. Baxter. "The incline leading to the upper platform or out of the lower would be easily climbed by motor cars. Cars would enter from one end.

"The parking platforms would be 70 feet wide and 260 feet long. Cars would pass up the center until reaching an open space along the side, where they would back into the space and line up at an angle along the side. This would give about 30 feet in the center for maneuvering cars. A traffic officer could direct this."

Genuinely Unusual Engine Starting Idea.

Carrying the engine starter idea probably a little further than it ever has been carried before, the makers of the British Jackson car have evolved an arrangement whereby the engine is started automatically by the weight of the driver as he enters the car. In its simplest aspect, the system involves the use of a movable step which is connected with a rack and pinion mechanism operating directly on the clutch shaft. When the driver steps on the step, the rack is brought into engagement with the pinion and the weight of the driver when moves the step downward, pushing the rack over the pinion and starting the motor. Immediately the driver lifts his foot off the step it is spring-returned to its normal position, taking the rack out of engagement with the pinion.

DEVICES THAT FACILITATE ENGINE CLEANING

Construction and Operation of Miniature "Sand" Blasts That Use Cleaning Fluid Instead of Sand—Their Wide Range of Applicability and Their Superiority Over the Pail of "Gas" and the Brush.

If cleanliness is next to godliness in that portion of the universe not given over to, or inhabited by, man's mechanism—meaning inanimate mechanism—it is certainly next to efficiency in the world of whirring wheels and slippery bearings; dirt breeds friction and wear, and both of these undesirables are the arch enemies of efficiency. Q. E. D.

In the modern garage, the modern tendency toward cleanliness daily is becoming more marked. Which is as it should be, for dirt is the abhorred of all but a very few, whose opinion is not worth much anyway. And in the opinion of the clean majority it is not only the dirt that is in plain sight that must be cleaned away for the good of every ones' peace of mind and the efficiency of machinery, but the dirt that lies hidden from casual gaze—beneath the engine hood, for instance—also must be cleaned away, for ever if it does not offend the eye it is practically certain to offend the engine in reasonable time.

It is one of the defects of the modern cooling system that road dust and dirt continues to be invited inside by the fan, and as it is not likely that the defect will be remedied at least for some little time—if it is ever remedied—nothing remains but to apply the cure in lieu of the prevention. As nearly everyone knows, every engine is more or less oily. It is not easy to keep the outside of the engine entirely free from oozing oil and undoubtedly it is quite impossible to do so in the majority of cases. Hence, the dust that is drawn in through the radiator by the fan and distributed impartially over the engine "sticks around," to use an expressive idiom. To be rid of it, and to be rid of it quickly and easily and in a thoroughly satisfactory manner is the problem that presents itself to the thoroughly up-to-date garage proprietor with his eyes on the little things.

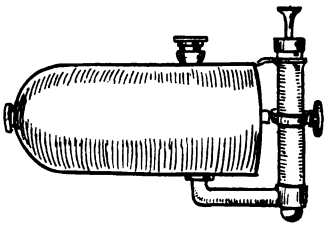
FOUR TYPES OF GARAGE MOTOR CLEANERS THAT DIFFER ONLY IN DETAILS

The Danger of Sloppy Cleaning.

To the average garage mechanic, however, the problem is no problem at all, for, being unaccustomed to look upon the economical side of things that the business garage proprietor finds now more than ever to be so essential to any kind of success, a pail of gasolene and a stiff brush or a wad of waste makes a very potent appeal. That this antiquated method has its drawbacks, not to say its dangers, is apparent on the surface, for aside from the high cost of fuel, which brings a tear to every eye, the board of fire underwriters is likely to look at the practice askance even if the boss does not. Nevertheless, the pail of gasolene and the brush has become more or less of an institutiton in a great many garages, despite its bad features, only two of which have been outlined.

The successful operation of the modern garage requires the use of modern apparatus. That it no longer is possible for a garage proprietor to exist under the old methods that permitted the proprietor of a stable to make his wife all sleety with diamonds has been demonstrated too often, as is made plain by the records of the bankruptcy courts, to require reiteration. Efficiency—business efficiency and mechanical efficiency—is the keynote of present-day methods, and not until this fact has been assimilated by the garage proprietor can he be expected to "make a go of his job."

The cleaning of engines that always require cleaning is not a very big item on the books of any garage, but it is an item that is plenty big enough to warrant thoughtful attention; and, incidentally, it is the ones who give thoughtful attention to the little things who eventually find it necessary to give attention to big things.



To get back to engine cleaning: There are two ways in which this can be done, and of them the old way—the dirty, sloppy, dangerous brush-and-pail-of-gasolene way—is too well known to need further discussion. The modern way to tackle the job, which is a mean little job in any case, is to do it

Digitized by Google

with modern apparatus that has been designed especially for the service and therefore can be expected to operate in an economical and thorough manner. To take the place of the brush and the pail of "gas" there have been developed within a comparatively short space of time seven or nine different types of engine cleaners that are as far ahead of the brush and the pail as the automobile is ahead of its prototype of ten or a dozen years ago.

Sand-Blasts Using "Gas" for Sand.

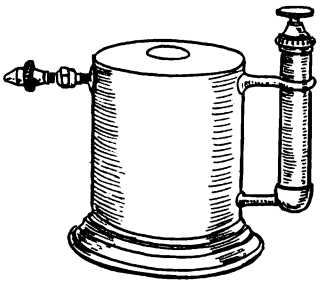
In effect, these devices all are exactly the same, and there is but one principle involved in all. To be brief, they all act exactly like a sand blast, only sand is not used, of course. In all of them either gasolene or kerosene takes the place of the sand in a sand blast under ordinary circumstances, though it is quite possible to "load" them with soap-suds or soda-water or anything else that may appeal to the operator or that may be useful in removing accumula-

STEVENS MOTOR CLEANER

tions of dirt and grease from parts that are not easy of access even with a brush and a pail of "gas." All of the various devices of the kind are a little bit different, of course, though none is even a little bit complicated despite its external appearance.

Take the Binks, for instance, that is produced by the Star Brass Works of Chicago, Ill. It consists of nothing more complicated than a strong galvanized iron tank carrying a pump which is mounted on and screws in with the cover at the top through which the cleaning liquid, whether it be gasolene or kerosene or anything else, is poured in. To operate the device, about two gallons of gasolene, for instance, are placed in the tank, the top is screwed tight and 30 or 40 strokes given the pump handle. The result is that the air pressure drives the gasolene out in a very finely divided spray under considerable pressure and that the spray very effectually "cuts" the grease and the dirt and washes it away. Obviously, the very small amount of gasolene that is used evaporates very quickly and there is none of the slop and the danger always present when a brush, dipped in a pail of gasolene, is none too carefully wielded by a mechanic anxious to finish an always dirty and never appealing job.

Aside from the economical value of any device of the kind which uses but a tiny fraction of the gasolene ordinarily used under other circumstances, its value to the owner of the engine is not difficult to see. Where an attempt is made to clear away the accumulated oil and dirt by slopping gasolene over the engine, there is grave danger that a good deal of the grit will be washed into the bearings with disastrous

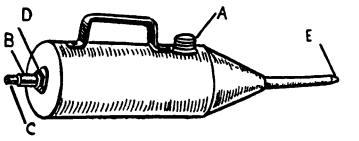


WAGNER KEROSENE WASHER

results. If, on the other hand, the dirt is permitted to remain on the engine, it is quite as likely to work itself into places where it should never accumulate.

Operating Precautions That Are Needed.

It is obvious, of course, that when any of these pressure engine cleaning devices is used with gasolene great care must be taken that no open flame is near the operator, for it needs no explanation to make plain that the fine spray of fuel and air is more inflammable than is gasolene contained in a can. Also, inasmuch as most pressure cleaners will force the gasolene 10 or 12 feet, whatever flame or danger of fire there is must be proportionately further away from the nozzle than it ordinarily would be away from the pail of gasolene. They must, in fact, be used out of doors whenever possible, unless, of course, they are loaded with some non-inflammable cleaning fluid.



The Turner motor washer, which is

TURNER HAND WASHER

manufactured by the Turner Brass Works of Sycamore, Ill., is quite a little different from the Binks, as the accompanying illustrations show. Whereas the pump in the Binks is contained within the tank, in the Turner it is mounted outside. The tank itself is made of drawn steel and it is extremely doubtful if it would be possible to blow it up with the pump that forms part of the equipment. So that the operator may know when he has sufficient pressure in the tank, a gauge, reading to 100 pounds, is supplied. The hose is 10 feet long and is fitted with an adjustable nozzle that will deliver either a fine stream of cleaning fluid or a spray.

The Auto-Cleaner, which is made by the Bishop & Babcock Co. of Cleveland, O., and distributed by the Cleveland Faucet Co., is quite like the Turner, the essential differences being made plain by the picture. The pump in the Auto-Cleaner is slightly larger than it is in the Turner and the cleaning nozzle is longer, so that it can be reached into places ordinarily quite inaccessible to the brush-and-gasolene operator. The outfit complete consists of a three-gallon seamless galvanized steel tank with the hand pump attached—though connections can be supplied to attach the tank to an air compressor system provided there is one in the garage—gauge and safety valve, 10 feet of flexible hose and the nozzle which is adjustable. In use, the tank is pumped to about 80 or 100 pounds pressure and either gasolene or kerosene can be used with very nearly equally good results. The Rapid, which is produced by the Rapid Auto Cleaner Co., of Newark, N. J., is another that differs from the three previously

ROMORT PRESSURE CLEANER

described only in details. The pump, as may be seen in the picture, is mounted at the side of the tank, the outfit including a pressure gauge, the necessary flexible hose and an adjustable nozzle.

Scope of Usefulness that is Wide.

Needless to point out, the field of usefulness of such devices is not confined to the cleaning of engines, though doubtless they are most useful for this purpose. They can be used quite as effectively in cleaning chassis, for instance, and the intricacies of gearsets and differential mechanisms. Radiators also suggest themselves as a fertile field for the exploring spray from one of them, and when the liquid has been exhausted the tank can be used as a blower to induce some of the dust accumulated by upholstery to settle somewhere else. For chassis parts such as wheels and axles and fenders, the cleaner can be loaded with soap-suds or a solution of washing soda and water and the activities of the man with the sponge and the hose rendered shorter and more productive of good results.

Of course, all of the devices that have been described are rather large and are more suited for garages where a great

Digitized by Google

amount of engine cleaning is done than they are for smaller garages where only an occasional job of the kind is done. For the smaller garage and for the private owner who objects to soiling his hands and his clothing on work that should be done at regular intervals for the preservation of the engine, several smaller cleaners of a size suitable to be carried in the hand are available, four of them being illustrated herewith.

The first, which is the Turner, and like its larger brother is produced by the Turner Brass Works of Sycamore, Ill., suggests not a little the more or less common gasolene torch that forms a part of the equipment of nearly every garage. In operation, it is exactly like the larger Turner, which is to say it is partly filled with either gasolene or kerosene or soapsuds, pumped up by means of the pump that forms the handle and it is ready for work. The whole thing holds only a quart of liquid and therefore is quite light and can be poked into all sorts of out-of-the-way places where a larger and heavier machine might not prove so useful. The nozzle is adjustable to throw either a stream of liquid or a fine spray.

The Stevens cleaner, which is made by the Stevens Mfg. & Supuly Co., of Chicago, Ill., differs considerably from the Turner both in shape and in the manner of operation. Like the Turner, however, it can be adjusted to throw a spray or a stream. The tank is made of seamless brass and holds one quart of liquid. Pressure is raised by means of the little pump that forms part of the handle and the stream is released by pulling out a tiny button that normally is held in place by the grasp of the hand on the handle.

Devices that Work Without Pumps.

In both construction and operation, the Romort engine cleaner, which is distributed by the Union Hardware & Metal Co., of Los Angeles, Cal., differs from all of the others. The air and the gasolene or cleaning fluid, whatever it may be, do not mix except at the nozzle. The device itself—looking more like a great cartridge than almost anything else—is shown by the accompanying picture. In charging the device, the cleaning fluid is poured in after removing the cap marked A. The tank contains no compressed air, the source of supply being attached at the threaded stud C at the end opposite to the nozzle end. D is the nut that holds the air attachment in place. When the knurled nut B is turned, the nozzle E is opened and at the same time the air passes through the tank, picks up the cleaning fluid at the nozzle and issues as a fine spray (F). As with the others, the stream can be adjusted.

The Wagner cleaner, which is produced by the Wagner Specialty Co., of 18 West 63rd street, New York City, is another that differs from all of the others, the essential difference this time being that the device has been constructed primarily for kerosene and the makers caution against the use of gasolene with it. The device itself scarcely requires description, it is so simple. It is shown in its entirety by the accompanying picture. Essentially it consists of nothing more than two small tubes drawn into one at the nozzle. One of the tubes is connected to the source of air supply, six pounds pressure being sufficient to operate the washer, and the other draws kerosene from any convenient receptacle.

Electric Ignition for Cigars.

It doesn't need any argument to prove to anyone who ever has tried to light a "smoke" in a moving automobile that it isn't

CENTURY CIGAR LIGHTER

the easiest thing in the world to do with a match. Therefore it ought to follow that anything that will make the lighting of said "smoke" a simple and easy matter ought to get a real welcome from smoking motorists.

With the "Century" electric cigar lighter shown in the accompanying picture all that is necessary is to hold the end of the little device against the end of the cigar, press the button and "start the pump." Electricity produces a hot glow in the "business end" and the tobacco is soon ignited. The lighter is made by Mabey's Electric & Mfg. Co., of Indianapolis, Ind.

Winter Care of Tires and Tubes.

That metal is perishable under certain conditions is also too true to admit of debate, and it follows therefore that tires are more likely to suffer from neglect when cars are laid up for the winter than are other parts of the car. The proper way to insure against trouble when they are brought out of their state of seclusion, according to L. C. Rockhill, manager of the automobile tire department of the Goodyear Tire & Rubber Co., is to remove them from the rims and store them somewhere, piled one on the other and not standing up, where the temperature is neither too high nor too low. A dark room is preferable, of course, for light has as deleterious effect on rubber, but if one is not available, the casings should be covered with canvas. If plenty of French chalk is sprinkled between the tubes and the casings, the tubes can be left in place, though they should be inflated just enough to make them stand up round. The better way, however, is to treat them as the casings are treated—pile them one atop the other, partly inflated, and cover them with canvas.

When Equipping for Double Ignition.

It is one of the advantages of the T-head type of motor that with the majority of them it is quite possible, with the aid aid of a little ingenuity and some tools, to equip them with an extra set of spark plugs and so make surer ignition and in some cases materially to increase the power output. Where the plugs are over the intake valves, for instance, which is their usual location, a second set of plugs can be placed over the exhaust valves in place of the compression relief cocks, of course, but as there are several makes of combined cocks and spark plugs on the market this need cause no great amount of worry. The one thing to remember when an extra set of plugs is added is that it is absolutely essential that the gaps in both sets be exactly the same, for unless this is so the benefit of the second set will be very problematical. High tension current always has taken and always will take the path of least resistance. Hence, if the gaps in one set of plugs, or in one plug, is smaller than in the other plugs to which they are connected, the spark at the plug or plugs with the wider gaps will be very weak and feeble and will have little effect in "setting off" the mixture. With most magnetos, the manufacturers furnish a guage and it is a good plan to set all the plug gaps to this gauge. Obviously, when a second set of plugs is added, each plug in the set is connected directly to the terminal of the original plug in the same cylinder.

Lamps Should Be Cleaned When Lighted.

A precaution that is said to add to the life of a tungsten filament lamp by preventing breakage of the delicate threads is to clean the glass while the lamp is burning; the filament is less likely to break when hot than when cold. Feather dusters are considered harmful and should not be used about the lamps.

1,061,015. Tire Tool. Gustav Schaefer, New York, N. Y. Filed Dec. 26, 1911. Serial No. 667,626. (Hooked tire removing tool.) 1 claim.

1,061,020. Attachment for Vehicle Lamps. Elwood H. Shinn, Masonville, N. J. Filed Dec. 18, 1912. Serial No. 737,423. (Lamps moved by steering gear.) 4 claims.

1,061,053. Head and Tail Light Control. Willard G. Davis, Nicholasville, Ky. Filed April 13, 1912. Serial No. 690,552. (Lamps connected to be moved by steering gear.) 1 claim.

1,061,062. (Measuring-Pump. Lloyd D. Freeland, Portage, Wis. Filed April 3, 1911. Serial No. 618,538. (Crank-operated fuel or oil measuring pump.) 17 claims.

1,061,086. Resilient Wheel. Hormidas Lafleur, Leominster, Mass. Filed Nov. 27, 1912. Serial No. 733,777. (Wheel with curved spring spokes and sliding guide spokes.) 1 claim.

1,061,087. Automobile Light-Controlling Device. Benjamin D. Lake and Nathaniel G. Marks, Springfield, Ky. Filed Aug. 28, 1912. Serial No. 717,553. (Lamps connected to steering gear.) 2 claims.

1,061,204. Tire. William T. Smith and Charles C. Royer, Bellefontaine, Ohio; said Boyer assignor to Myrtle Smith, Bellefontaine, Ohio. Filed March 19, 1909. Serial No. 484,503. (Tire with core of rubber disks.) 1 claim.

1,061,223. Counterbalanced Unloading Device for Trucks. Fred A. Cook, Portland, Ore. Filed Nov. 11, 1911. Serial No. 659,870. (Tilting truck body.) 6 claims.

1,061,272. Engine-Muffler. Clarence E. De Witt, Mount Jewett, Pa. Filed Nov. 29, 1912. Serial No. 734,112. (Muffler with removable frustro-conical sections.) 4 claims.

1,061,308. Explosive-Engine. Robert McKee, Philadelphia, Pa. Filed March 19, 1909. Serial No. 484,364. (Reversible four-cycle motor.) 15 claims.

1,061,310. Vehicle Spring. J. Walter Moore, Fort Edward, N. Y. Filed Jan. 14, 1911. Serial No. 602,700. (Coil springs and linkage system.) 2 claims.

1,061,313. Armored Pneumatic Tire. William Robert Morrison, Chicago, Ill. Filed Feb. 2, 1911. Serial No. 606,095. (Steel-clad pneumatic tire.) 4 claims.

1,061,342. Vehicle-Spring. Claud M. Waltz, Summitville, Ind. Filed Aug. 26, 1912. Serial No. 717,104. (Spring leaves with longitudinal grooves.) 3 claims.

1,061,344. Vehicle Wheel. Martin S. Weist, Sedalia, Mo. Filed June 26, 1912. Serial No. 706,053. (Telescopic spokes with cushioning coil springs.) 1 claim.

1,061,391. Tire-Patching Device. Gustave J. Martel, Chicago, Ill. Filed Sept. 7, 1911. Serial No. 648,134. (Means for attaching patching strap.) 1 claim.

1,061,396. Explosive-Engine. Harry W. Moore, Nebraska City, Neb., assignor to Ralph A. Duff, Nebraska City, Neb. Filed Sept. 13, 1911. Serial No. 649,010. (Engine with two-diameter pistons and cylinders.) 5 claims.

1,026,709. Automobile Headlight. Conrad Shermund and Raymond Alfred Mallett, Sacramento, Cal. Filed Nov. 22, 1911. Serial No. 661,750. (Headlights connected to steering gear.) 2 claims.

1,026,728. Steering Mechanism. Martin L. Williams, South Bend, Ind. Filed March 9, 1908. Serial No. 420,012. (Steering mechanism with cam-like movement.) 4 claims.

1,026,732. Apparatus for Distributing Fuel in Internal-Combustion Engines. Hans Th. Bruns, Nuremberg, Germany. Filed Jan. 24, 1911. Serial No. 604,496. (Pressure fuel feed system.) 5 claims.

1,026,749. Ball-Cage for Ball-Bearings. Hermann Kapper, Treptow, near Berlin, Germany, assignor to The Firm of Deutsche Waffen & Munitionsfabriken, Berlin, Germany. Filed Feb. 10, 1912. Serfial No. 676,838. (Two-piece sheet metal ball retainer.) 2 claims.

1,026,761. Fuel and Water Regulator for Steam Boilers. Robert Miehle, Chicago, Ill. Filed Sept. 26, 1907. Serial No. 394,605. (Thermostatic steam boiler control.) 11 claims.

1,026,783. Wheel. Walter Black, Mendota, Ill. Filed Nov. 5, 1910. Serial No. 590,841. (Wheel with springs between inner and outer rims.) 2 claims.

1,026,803. Automobile-Tire. Ezra M. Hamilton, Willow Springs, Cal. Filed Dec. 17, 1910. Serial No. 597,937. (Wheel with transverse tubular cushions between tread and rim.) 2 claims.

1,026,810. Spring-Wheel. Joseph Kuehl and Joseph Stefanowski, Detroit, Mich. Filed July 1, 1910. Serial No. 569,897. (Wheel with springs between tread and rim.) 1 claim.

1,026,813. Hinge-Joint for Windshields. Peter N. Landine, Milford, Conn., assignor to The Rostand Mfg. Co., Milford, Conn.; a corporation of Connecticut. Filed Dec. 5, 1911. Serial No. 664,109. (Hinge with locking device.) 6 claims.

1,026,822. Resilient Wheel. Frederick C. Oldham, Brooklyn, N. Y. Filed Oct. 19, 1910. Serial No. 587,961. (Wheel with spring-and-plunger spokes.) 2 claims.

1,026,827. Propulsion of Motor-Vehicles. Henri Pieper, Liege, Belgium. Filed Jan. 23, 1911. Serial No. 604,225. (Electric vehicle control with means for charging battery from motor when coasting.) 5 claims.

1,061,807. Tire. William A. Binion, Newark, N. Y. Filed Nov. 22, 1911. Serial No. 661,701. (Cushion tire with springs and plungers.) 1 claim.

1,061,816. Demountable Rim. Joseph H. Champ, Cleveland, Ohio, assignor to The Standard Welding Co., Cleveland, Ohio, a corporation of Ohio. Filed April 5, 1912. Serial No. 688,574. (Q. D. rim and locking device.) 5 claims.

1,061,893. Transmission Device. Thomas H. Williams, Buxton, Iowa. Filed June 5, 1912. Serial No. 701,801. (Transmission with fluid control.) 20 claims.

1,061,905. Tire-Fastener. Luke G. Fleming, Tarrytown, N. Y. Filed Oct. 5, 1912. Serial No. 724,047. (Locking device for Q. D. rim.) 3 claims.

1,061,910. Automobile Number Carrier and Drop. George H. Hewitt, Jr., Jersey City, N. J. Filed Dec. 20, 1909. Serial No. 534,094. (Means for carrying and dropping automobile identification tags.) 3 claims.

1,061,927. Tire. Salvatore Scognamillo, New York, N. Y. Filed Sept. 25, 1911. Serial No. 651,206. (Tire with core formed of continuous coiled springs.) 1 claim.

1,061,938. Gearshifting-Lever Lock. Otto W. Hahn, San Francisco, Cal. Filed May 23, 1912. Serial No. 699,185. (Device for locking gear lever to H-plate.) 4 claims.

1,061,943. Automobile Transmission-Lock. Harvey M. Johnstone, Lincoln, Neb. Filed March 22, 1912. Serial No. 685,446. (Device for locking gear lever in neutral position.) 2 claims.

1,026,653. Combination Spark-Plug. William C. Brunt, Boston, Mass. Filed Dec. 9, 1911. Serial No. 664,752. (Terminal with insulating handle.) 8 claims.

1,026,662. Control of Vehicle Driving-Wheels. Felix A. Eisner, Rochester, N. Y. Filed July 10, 1908. Serial No. 442,927. (Hydraulic four-wheel drive system.) 16 claims.

1,026,667. Tire-Inflation Mechanism. Royal L. Foster, Fort Riley, Kans. Filed Nov. 26, 1910. Serial No. 594,350. (Tire inflating device carried on wheel.) 1 claim.

1,026,693. Fuel and Water Regulator for Steam-Generators. Robert Miehle, Chicago, Ill. Filed June 12, 1908. Serial No. 438,097. (Thermostatic boiler regulation.) 22 claims.

1,061,641. Folding Top for Vehicles. Elial M. Staples, Elizabeth, N. J. Filed Feb. 28, 1912. Serial No. 680,441. (Temporary support for automobile top.) 3 claims.

1,061,677. Transmission Speed-Reducing Gearing. Arthur King, St. Louis, Mo. Filed Dec. 21, 1911. Serial No. 667,149. (Planetary gear.) 4 claims.

1,061,716. Starter for Internal-Combushtion Engines.) David W. Anderson, La Fayette, Ind. Filed Dec. 28, 1911. Serial No. 668,334. (Distributer for fluid pressure starter.) 1 claim.

1,061,719. Engine Starter. Edwin D. Bangs, Milwaukee, Wis. Filed March 5, 1912. Serial No. 681,723. (Compressed air starter.) 2 claims.

1,061,722. Device for Shaping the Outer Casings of Pneumatic Tires. George Wilson Bell, Stockport, England. Filed July 25, 1912. Serial No. 711,382. (Tire mould.) 5 claims.

1,061,743. Dump-Wagon. Charles D. Heile, Oak Park, and Ernest George Snyder, Chicago, Ill., assignors to H. McFarlane & Co., Chicago, Ill., a corporation of Illinois. Filed Aug. 14, 1911. Serial No. 643,815. (Tilting body on turntable.) 2 claims.

1,061,756. Piston. Charles Y. Knight, Coventry, England. Filed Sept. 28, 1910. Serial No. 584,179. (Piston with removable outer sleeve below piston rings.) 2 claims.

1,061,759. Friction Transmission Mechanism. John W. Lambert, Anderson, Ind., assignor to The Buckeye Mfg. Co., Anderson, Ind., a corporation of Indiana. Filed May 31, 1910. Serial No. 564,151. (Friction transmission for four-wheel drive.) 2 claims.

1,061,775. Silencer for Engines. Charles H. Newton, East Orange, and Erwin S. Sanfield, Newark, N. J., assignors, by mesne assignments, to Standard Co., Torrington, Conn., a corporation of Maine. Filed Jan. 2, 1912. Serial No. 668,989. (Muffler with large expansion chamber and a single diagonal baffle-plate.) 5 claims.

1,061,798. Concrete Garage. Ralph F. Yourtee, St. Louis, Mo. Filed March 12, 1912. Serial No. 683,283. (Method of constructing concrete garage.) 1 claim.

1,061,796. Two-Cycle Engine. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to the Winton Motor Carriage Co., Cleveland, Ohio. Filed Jan. 20, 1908. Serial No. 411,753. (Two-cycle motor with gas pocket in piston.) 6 claims.

1,061,799. Spring-Wheel. Benjamin Anderson, Gebo, Wyo. Filed Sept. 4, 1912. Serial No. 718,517. (Wheel with curved spring spokes.) 1 claim.

1,061,420. Shock Absorber. Herman H. Sunvold and Halfdan Larson, Sacred Heart, Minn. Filed July 1, 1912. Serial No. 707,030. (Strap and spring rebound check.) 1 claim.

1,061,450. Differential Mechanism. Arthur Coleman, Higgins, Tex. Filed Sept. 5, 1912. Serial No. 718,746. (Bevel differential for worm-driven axle.) 5 claims.

1,061,458. Vehicle Wheel. William Downham, Jr., Philadelphia, Pa. Filed July 1, 1911. Serial No. 636,352. (Tire seated in V-grooved rim.) 1 claim.

1,061,511. Piston-Pump for Automobile Fire Apparatus. Albert C. Webb, St. Louis, Mo., assignor to The Webb Motor Fire Apparatus Co., St. Louis, Mo., a corporation of Delaware. Filed Feb. 5, 1912. Serial No. 675,410. (Mechanically driven reciprocating fire pump.) 3 claims.

1,061,523. Tire Armor. John J. Bukolt, Stevens Point, Wis. Filed May 9, 1912. Serial No. 696,174. (Tire armor of jointed metal plates.) 7 claims.

1,061,524. Tire-Armor. John J. Bukolt, Stevens Point, Wis. Filed Aug. 8, 1912. Serial No. 714,045. (Tire armor of jointed metal plates.) 9 claims.

1,061,528. Valveless Two-Cycle Motor. Oscar Deprez, Brussels, and Armand Richir, Anderlecht-Brussels, Belgium. Filed Jan. 26, 1911. Serial No. 604,852. (Twin cylinder motor with common combustion chamber.) 8 claims.

1,061,537. Vehicle-Wheel. Lucien R. Gruss, San Francisco, Cal., assignor to Auto Compressed Air Wheel Co., Chico, Cal., a corporation of California. Filed March 16, 1911. Serial No. 614,822. (Wheel with cushion cylinders between hub and rim.) 9 claims.

1,061,536. Gasolene-Engine Starter. Daniel Fuhrer, Bluffton, Ind. Filed April 27, 1912. Serial No. 693,626. (Starter of the priming type.) 3 claims.

1,061,580. Elastic Wheel. Charles Adams-Randall, New York, N. Y. Filed Sept. 7, 1906. Serial No. 333,689. (Wheel with radial coiled springs around hub.) 2 claims.

Get into business *to stay.*
Enjoy a year-round trade.
Share the *permanent* success of the—
"World's Champion Car"

National

Be more than a mere dealer

Join the *National* "family" and you become an integral part of our selling organization, the same as though you had your desk in our home offices. We not only work *for* you, but *with* you.

First, we write the fairest contract possible. Let us prove it by comparisons.

Then we give you the best guarantee—a guarantee of good faith and reliability, based on the quality of our cars and our dependable business methods. We give you practical service—not mere promises.

We want every National dealer to build as permanent a business as we are building at our factories.

One question in a million brains

All over this country serious-thinking men like you are asking—

"What is the future of the motor car business?"

We believe that more cars than ever before will be sold. The future of the motor car business is *good.*

Good for what?

Good for the *good* builder and *good* dealer.

You simply can't be a *good* dealer for a *bad* builder.

Your hard work and cleverness cannot outweigh the faults of the builder. Why spend *your* money and *your* labor to try and make good for a bad builder?

A car can rise no higher than its source—its builder.

A dealer can rise no higher than his car.

Catalog specifications, the paint on the hood, and salesmen-speeches are futile if the car is not 100% quality, if the builders back of it are not reliable, service-generous, perfectly responsible and here-to-stay.

We know *our word* is as good as that of any builder

Yet we ask you to look at the *honest value* of the *National* car. Consider its thirteen years of success; consider its prestige as International 500-mile race record holder; World's Stock Champion; fastest mile with stock car and unequaled heritage of international successes. *No other car* offers you such a security or guarantee as the *National.*

The *National* is a *good* car; backed by *good* builders.

What is the dealer's biggest mistake?

We asked this question of several men.

Answers differed, but they all admitted this one: "They make promises they can't keep."

Often, too, the dealer was sincere. The fault was with the builder who over-estimated the worth of his car. You, the dealer, suffer in such a case.

In the *National* this error is eliminated. You simply tell the truth—this is strong enough. The plain, honest facts about the *National* would be gross exaggeration about inferior cars. You need never fear the result of a sale of a *National.* The owners are your best friends. The fulfilment of your promises are *built* right into the life, power and sinews of every *National* car.

Visit the *National* factories. It will be a treat, a revelation, and an education. If you cannot come, write to us, and let us go into details with you about our dealer's proposition. It costs nothing to investigate.

National Motor Vehicle Co., Dept. 90 Indianapolis, Ind.

WHICH?

Body or Chassis?

The most important subject in connection with Auto-buying discussed in new booklet

The least understood part of the motor car—the *chassis*—which really represents seventy-five per cent of your car purchase, is discussed in a vigorous, open-faced manner in the latest booklet describing

FOURS PATHFINDER MOTOR CARS SIXES

It throws a new light on the dark region beneath the hood and floor boards which the inexperienced buyer will immediately appreciate.

You seldom hear a motor car salesman enthuse about the chassis, but he makes frequent reference to the "easy-riding qualities" of the car he is selling without telling you WHY.

Whichever you believe most in, body or chassis, you cannot afford to be ignorant of the *vital* part of your purchase.

Look Under the Pathfinder Hood

If you like the body design and the accessories on the dash, take a look beneath the hood of the Pathfinder and get posted on both sides of the question.

One thing is positively certain about the trend of the times in the automobile industry.

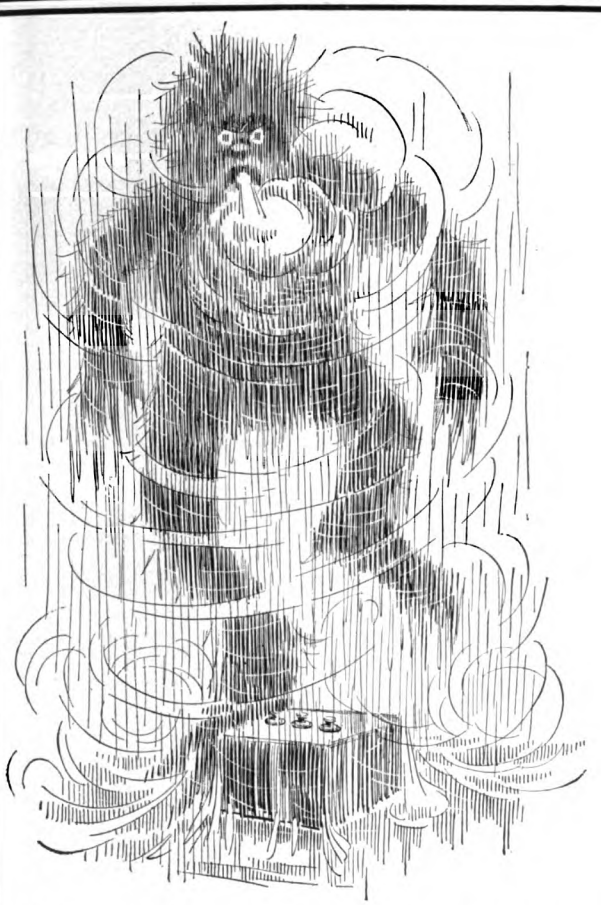
When manufacturers find they have reached the limit in extravagant accessories, they will pay more attention to the "business end" of the motor car, the *chassis*.

The Pathfinder is easily distinguished from the rank and file of medium-priced cars by its scientific chassis construction.

The Pathfinder Company was the first to give a complete chassis description in its literature and still remains the only company featuring detailed chassis construction in its catalog.

Here's a splendid opportunity for you to get an educational prospectus on the development of automobile buying by writing for our "Guide to Automobile Buying" and standard catalog.

The big question in your mind about the mysterious chassis will be comprehensively answered by our chassis analysis.



This desirable Pathfinder literature is FREE for the asking—Get it. Your name and address on the margin of this page will do.

NEW DEPARTURE BALL BEARINGS

American-Made for American Trade

The Proof of the Bearing Is In Its Service

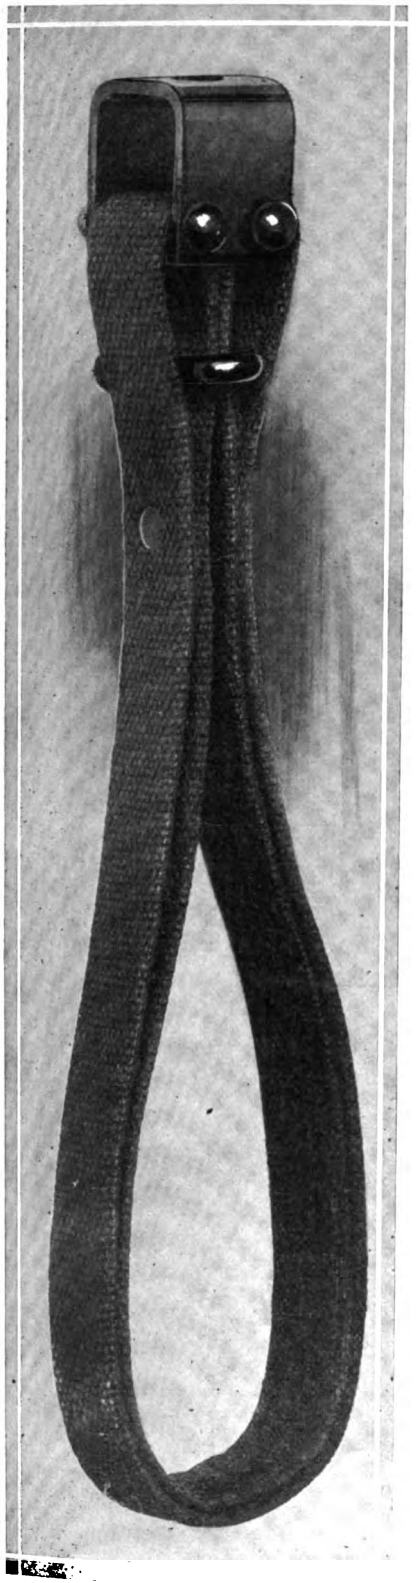
The garage man knows better than anybody the comparative service merit of the bearings installed in motor cars he cares for and repairs.

We recently sent out letters to garage men throughout the country, asking them their opinion of New Departure Ball Bearings, based on their experience with it.

The complete summary of all responses received the first week shows that 96 per cent. of the garage men who have been using New Departures found them absolutely satisfactory. Many of them went as far as to say that it has proved superior to all others.

This remarkable evidence of the quality and efficiency of New Departure Ball Bearings is absolutely indisputable. Users of foreign-made ball bearings, whether garage men or manufacturers, should give this American-made bearing a thorough trial.

Every manufacturer, purchasing agent, superintendent, and designing engineer should have the Engineering Edition of the New Departure Ball Bearing Catalog and the brochure on "Bearing Friction and Its Elimination."



Every garage proprietor and superintendent should have the new Ball Bearing Garage Manual, now in its third edition. Either one, or all of these books, will be sent free on request. Drop us a line now.

The Gilmer Rebound Strap

WHY is it that other rebound straps are not put on cars like Gilmer Rebound Straps?---one-half or one inch only of play between the axle and the strap.

What other rebound strap has the strength to admit of this ideal method of application?

Gilmer Rebound Straps are standard on many American cars noted for their sturdy rear axle construction. One inch rebound play is all that is allowed on these cars so there can be no question as to the strength and efficiency of Gilmer Straps when many of America's foremost engineers have shown their preference for them---this in the face of more attractive priced competing goods.

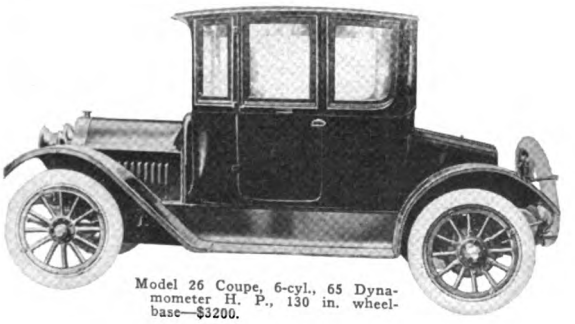
Examine a HAYNES Car

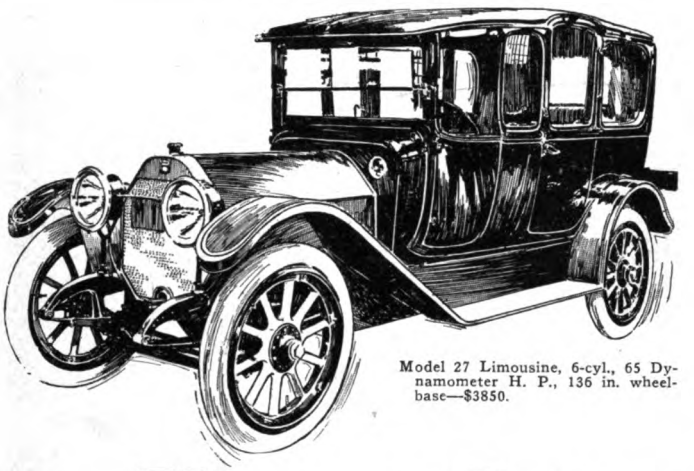
with the Vulcan Electric Gear Shift the first chance you get

Every wide-awake auto dealer ought to keep up-to-date on automobile improvements. Here's a feature you want to see—a feature that's the biggest improvement the automobile has seen for many a year.



You merely press push buttons and electricity does the work

These push buttons are located in a small dial placed in the center of the steering wheel. There is a button for each of the three speeds forward, reverse and neutral, also buttons for starter and horn, as you see in the picture.



Exceedingly Simple— Both Electrically and Mechanically

The Vulcan Electric Gear Shift is very simple, both electrically and mechanically. You probably know what electro-magnets are — they are nothing more or less than iron bars wound with electric wires. When an electric current is sent through the wires the iron bars become powerful magnets. When you press a push button controlling any of the gears and depress the clutch, the electric current is sent through the electro-magnet controlling the gear you want shifted, and the shift is instantly made with a pull of 150 pounds.

Model 26 Coupe, 6-cyl., 65 Dynamometer H. P., 130 in. wheelbase—$3200.

Digitized by Google

Model 27 Limousine, 6-cyl., 65 Dynamometer H. P., 136 in. wheelbase—$3850.

After you've seen this big feature in the HAYNES Car, you'll understand why it's making such a hit

You'll agree that the Vulcan Electric Gear Shift is the slickest piece of work-saving mechanism you've seen for a long time, and the biggest automobile improvement.

Bigger than other successes of recent years

The self-starter was a great thing, so was electric lighting. But here's a greater feature. Starting the car is an occasional need—lighting the lamps takes place even less frequently—but the gears are shifted time and time again every time the car is in use. The device, therefore, that entirely eliminates the throwing of the gears by hand and removes the danger of stripping the gears, is far more important than either of these features.

Haynes Dealers are making a big clean up

Without the Vulcan Electric Gear Shift Haynes cars would be great cars. Their reputation for reliability and power is a matter of common knowledge. They are the product of 20 years' automobile-making experience. They have everything in the way of comforts and conveniences that makes driving a delight, and owning a car a lasting satisfaction. The table of features given below will convince you that the Haynes from every standpoint is a most desirable car.

Leading features of the latest models

Specifications of the New Haynes

Motor—Bore 4¼ in., Stroke 5½ in. L-head **Haynes**. Cylinders cast in pairs. **Model 26, A. L. A. M., 43.35** H. P., Dynamometer 65 H. P. **Model 27, A. L. A. M., 43.35** H. P., Dynamometer 65 H. P. **Model 28, A. L. A. M., 29.9** H. P., Dynamometer 48 H. P.
Weight—Model 26, 3800 lbs.; **Model 27, 4000 lbs.; Model 28, 3400 lbs.**
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Carburetor—Stromberg.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on **Models 26 and 27**; McCue, Model 28, Gurney Bearings.
Front Axle—I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Hand lever shift optional at $200 reduction.

Tires—Models 26 and 27, 36 x 4½. **Model 28, 34 x 4.**
Springs—Front Semi-elliptic 39⅛ x 2, rear 48 x 2.
Brakes—15¼ external and 15 internal Models 26 and 27. 12 and 16 internal on **Model 28.**
Finish—Indiana dark blue body. Pacific Tour gray, optional
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Cowl-board Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge, and speedometer. Models 26 and 27 have rim wind clock.
Other Standard Equipment—Top, top cover, mechanical tire pump, rain vision ventilating windshield, **Vulcan Electric Gear Shift**, two large electric head lights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 12 volt, 60 ampere hour storage battery, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim, and Collins curtains. Models 26 and 27 have shock absorbers.

STANDARD OF THE WORLD

ROYAL——MODEL——OHIO

R. E. NORTHWAY *of the Manufacturing Department*

HI

C. D. PAXSON *of the Sales Department*

Talk to you thru the OHIO on the Keynote of Automobile Success, "Concentration and Elimination:"

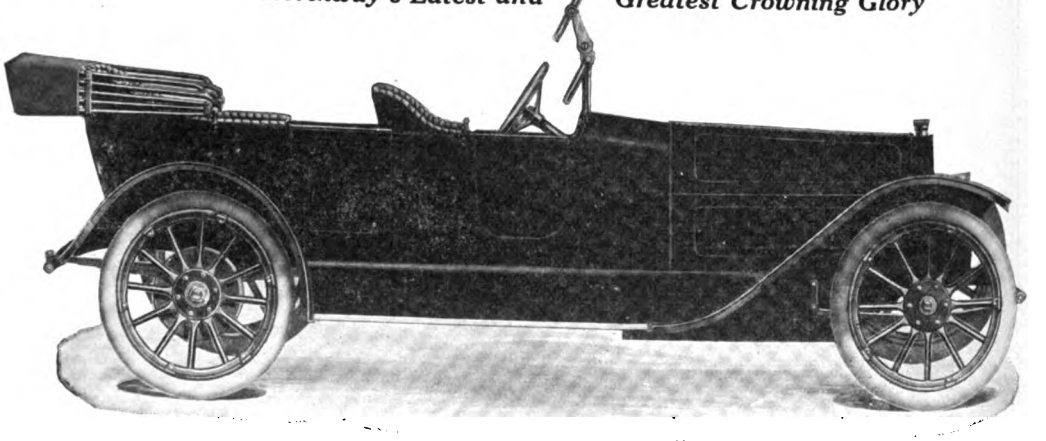
The two vital points in connection with the marketing of Automobiles at the present condition of the business are the QUALITY of the car and the PRICE. We believe that the keynote of Automobile success for both dealer and manufacturer is CONCENTRATION and ELIMINATION.

After twelve years of selling experience covering the entire United States, and by having my finger on the pulse of the trade during all this time, I feel that I know just what the public wants, and that is, A car of Quality and Reliability at a popular price. I have had experience in every stage of the industry, passing up every rung of the ladder as Driver, Repairman, Racer, Owner, Agent, Distributor and Manufacturer, and as such I know that there are just fourteen things that constitute the IDEAL Automobile, and these fourteen things are: MATERIAL, CONSTRUCTION, POWER, RELIABILITY, SIMPLICITY, DURABILITY, LINES, FINISH, RIDING, QUIETNESS, SERVICE, DESIGN, CO-OPERATION, and PRICE, all of which are concentrated in the ROYAL OHIO Models for 1914, and the production of such an ideal car will give to the Agent a car that will be an easy and ready seller. For a car to be a ready seller it must have behind it some striking feature that stands out prominently, and I don't think there is a factory in the world that is making a popular priced car who has the valuable asset that we have in the person of Mr. R. E. Northway, for he is today recognized as one of the greatest engineers in the country; his name is an absolute guarantee of quality and reliability.

His knowledge and experience has brought our factory up to the highest plane of efficiency by concentrating all his efforts and ability on two models, thus eliminating all unnecessary expense from a manufacturing standpoint. From a marketing standpoint we have eliminated three-quarters of the selling expense by one selling organization handling the entire output of four different factories, and consequently we are able to place on the market a car for $1,275.00 that cannot be duplicated at the price, and producing a Six-cylinder Model for $1,985.00 that is the equal of any car on the market at $2,500.00.

C. D. PAXSON.

To manufacture the MOST PERFECT Automobile at the LEAST possible cost is the one great aim of Automobile manufacturers, and to do this it requires, above everything else, KNOWLEDGE, ABILITY, EXPERIENCE, CAPITAL, and CONCENTRATION.



After years of experience and exhaustive tests and expensive experiments as the founder of the Northway Motor Company and original designer of that Company, I am now producing my very latest and what I believe will be my greatest success. I am endeavoring to produce in our two 1914 models, cars that both you and I will be proud of. I am using nothing but the very best material obtainable, employing the most skilled mechanics, and, above all, I am concentrating my ability, efforts, resources and capital on two models only, for I believe we can and are producing a better car at $1,275.00 by concentrating on it than we or any other factory could build for even $1,500.00 if we undertook to build four or five models.

My greatest aim is to make this one of the most efficient production factories in the country, so as to make it possible for us to produce a car of quality and reliability at a popular price, such as is being demanded by the public, and I honestly believe that no better cars are built for the money than we are producing in our ROYAL OHIO models for 1914. We have the facilities, the ability, and the capital to produce and manufacture the car.

Yours very truly,
R. E. NORTHWAY, Gen. Mgr.

AN INSTANTANEOUS SUCCESS

SINCE THE FIRST ANNOUNCEMENT OF THE

MOTOKART

in the columns of the Motor World our orders have far exceeded capacity. We have been compelled to temporarily limit the acceptance of further orders pending the extension of our manufacturing facilities.

Now, with greatly enlarged capacity, we beg to announce to the trade that in thirty days we will be in a position to fill all demands and make prompt shipments to all parts of the country.

The Motokart is the leader in a new field, one that offers exceptional advantages to the dealer. Straight merchandising, no trading for second hand cars, a positive public demand and a liberal margin of profit are among the features that commend the Motokart to experienced dealers.

Note these specifications:

3⅝ x 4 in. Two Cylinder, Four Cycle, Water Cooled Motor, Friction Drive, Pressed Steel Frame, Semi-elliptic Springs, 26 x 2½ in. Wire Wheels, 69 in. Wheelbase, 44 in. Tread, Box Body 51 x 32 x 32 in., Load Capacity 400 to 500 pounds—and then consider the SELLING FEATURES: Water Cooled Engine, No Gears to Strip, Small Traction Area, facilitating handling in crowded streets; Easy Spring Suspension protecting fragile merchandise, Metal Body, Large Cubical Box Area, Low Tire and other Maintenance Cost, Resilient Easy Running Wire Wheels, and last, but not least, the PRICE—$400.00, practically a Dollar a Day for a year.

Write now for territory—before the other fellow

Did you ever notice the axles of an automobile bounce up and down going over a rough road? This shock, strain and twisting is borne by the bearings of the axles and transmission.

Hyatt Roller Bearings cushion and absorb shocks, relieving gears and shafts of excessive strain.

The hollow flexible roller of the Hyatt Bearing is responsible for this great saving in wear and tear.

Two books, one about motor car bearings in general for prospective purchasers, the other for automobile owners, will be sent on request

Oldsmobile 1914

Four or Five Combination, Phaeton, Touring Body Type,

$2975

Seven Passenger Touring Body, $175 extra.
Limousine - $4300

Seven Passenger Touring Car, Model 54

Lower in price, and even higher in quality, than any of its predecessors—the Model 54—1914 Oldsmobile—is creating more concrete evidence of live dealers' interest than any other high grade six on the market.

THE PRICE

$2,975 practically eliminates competition with dealers handling cars priced from $4,000 to $5,000—for the Oldsmobile is as good as any of these. The lines of this car are of distinctive Oldsmobile design—a standard which has led all competition, whatever the price.

WE ARE SIX CYLINDER PIONEERS

Oldsmobile pioneered the six-cylinder motor, and it is unnecessary to dwell on the value of the years of ripe experience in the manufacture of six-cylinder cars—which is back of the Model 54. The Oldsmobile unit power plant 3-point suspension (bore 4¼, stroke 5¼), is a wonderful piece of machinery.

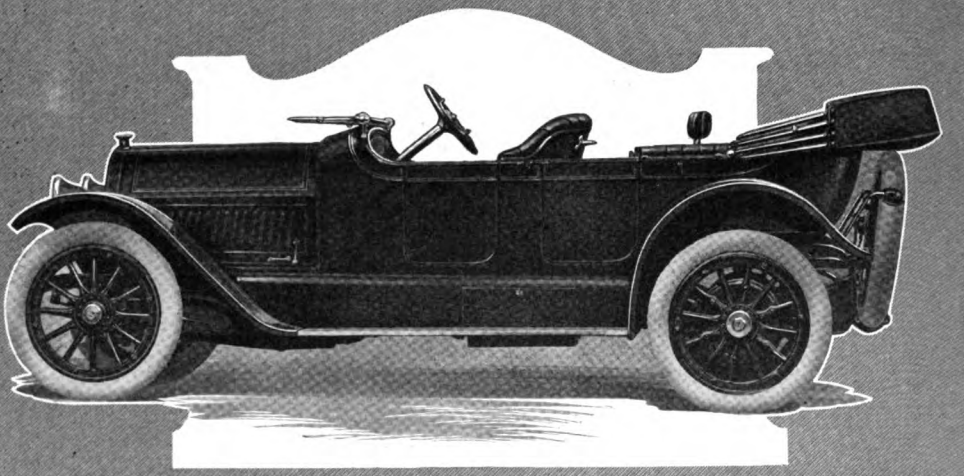
MATTERS OF COMFORT, UTILITY AND REFINEMENT

We learned how to build comfort into the Oldsmobile in the early days of the industry. If we knew of any better equipment or little matters of refinement than are on the Model 54 we would be the first to install them; but we have put everything into this car that spells utility, comfort and refinement.

Here are a few of the equipment details: The very latest and improved Delco system of self-starting, lighting and ignition. Noil motor driven tire pump. Combination electric and oil side and tail lamps, special Oldsmobile design. Special design Oldsmobile electric head lamps. Special design three-way adjustable ventilating windshield. Top, boot, and patented adjustable side curtains—60 miles speedometer. Adjustable stem setting and winding Waltham clock. Rear tire irons, capacity for two tires. Demountable rims, one extra. Imported horsehair tonneau mat. Electric light in tonneau. Extension electric trouble lamp.

PROMPT DELIVERIES

Never in the history of this Company have we been so well prepared to take care of our dealers by prompt shipment of cars as ordered. We began the delivery of our new models August first, and each day sees the regular quota of cars coming through the factory, tested and inspected down to the minutest detail, on schedule time. You can absolutely count on all delivery promises being adhered to rigorously.



WRITE US AT ONCE

In a short while, orders for all cars available for the coming season will be closed, and we shall be unable to go beyond this point. We urge, therefore, that if you wish to sell a car that measures up to the highest standards of quality, workmanship and design, you write us at once, letting us know your prospects, size of territory desired, and your facilities for properly representing the Oldsmobile line.

Those who are within the world of Cadillac ownership are enjoying luxuries to which you must remain a stranger so long as you are outside that world

Motoring as you know it, and motoring as the owner of a 1914 Cadillac knows it, are two distinct and different things.

The new Cadillac neither rides nor drives like any other motor car.

It is not that the two speed direct drive axle has changed the principle of the Cadillac engine.

But it has conferred upon it, powers which it did not possess without it.

It has altered the performance—changed the character of that performance—and changed the sensations resulting from that performance.

So, those who are within the world of Cadillac ownership, are enjoying luxuries to which you must remain a stranger so long as you are outside that world.

And they are marked, these differences—these peculiar luxuries of the Cadillac.

So marked, that we doubt if you can drive the memory of them out of your mind after a single ride in the Cadillac.

They are not easy to describe—though you will be conscious of them before the car has travelled half a mile.

But, let us see if we can give you an idea.

You know what the Cadillac—and the Cadillac engine—were before the advent of this 1914 car.

You know that it was notably free from tremor.

You know that it did not lunge forward, but forged forward, majestically, like a battleship.

These were the natural fruits of Cadillac construction—refined and developed to an extraordinary degree.

And now, new qualities and new functions have been conferred upon it, by means of a second—supplemental—principle.

This other principle—the two speed direct drive axle—takes the Cadillac at its high point of development and extends it.

Eliminating all technicalities from the subject, the advantage of the high direct drive gear ratio consists in the fact that through it, a given speed of the engine produces an increase of 42 per cent in the speed of the car.

Out of this central improvement grow those differences in operation to which we have referred.

Keeping in mind the more slowly moving engine, ***you sense at once that infinitely greater steadiness must follow.***

Holding fast to the same mental picture, ***you see that vibration must be reduced almost to the vanishing point.***

Imagine the car with the low direct gear, operating at an engine speed of 700 revolutions per minute.

The car will travel 21 miles per hour.

Shift the electric switch and pass into the high direct drive gear ratio, and the speed of the car increases to 30 miles an hour ***with no increase in the speed of the engine.***

Unconsciously, when you change gears, you look forward to the apparent effort and labor of the engine to be increased.

It does not come.

The trembling does not come.

No shock, no disturbance is communicated to the car or its occupants.

The steady pressing forward of the car is uninterrupted—the smoothness is continuous.

Yor forget the engine, you forget the car. There is only quiet—and a soft swinging through space.

Is it any wonder that Cadillac owners are volubly enthusiastic?

They have this velvety mode of travel of which you have yet to learn.

They have attained it by methods which lower the fuel consumption, decrease friction and reduce appreciably the cost of operation.

They have artistic body designs which make it difficult to suggest any sense in which their beauty could be heightened.

They have progressive, scientific engineering development.

They have the certainty of the Cadillac Delco system of electrical cranking, lighting and ignition.

They have the improved Cadillac carburetor, hot water jacketed and electrically heated.

They have entrance and exit for front seat passengers on either side,—right hand drive and right hand control with all of its advantages and no disadvantages.

They have the simple electric switch for shifting from high direct to low direct gear, or vice versa.

They have Cadillac standardization, true alignment and interchangeability of parts.

They have the product of an organization inspired by the highest ideals.

They have the Cadillac glorified and refined.

They have a car entitled to the distinction, "Standard of the World."

INVADER OIL

OILS differ in respect to their body or thickness---their ability to resist heat---their ability to resist cold---the amount of carbon they contain.

¶ The differences can all be measured and expressed in figures.

¶ ***Gasoline motors*** differ in minor mechanical details, but they are all alike in that they generate a higher temperature than any oil can withstand and they all require an oil to burn up cleanly.

¶ In other words, all gasoline motors require an oil which will stand the ***most heat*** before burning and deposit the ***least carbon*** after burning.

Territorial agents are in a posi... same prices as the main office

THE Waverley SILENT Electric

WAVERLEY FRONT-DRIVE-FOUR PRICE $2900

INTERIOR FRONT-DRIVE-FOUR

INTERIOR REAR-DRIVE-FOUR PRICE $2800

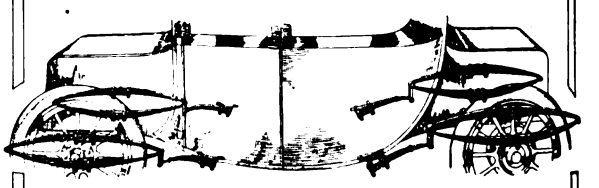
INTERIOR-FRONT & REAR-DRIVE BROUGHAM PRICE $3000

FASTIDIOUS REQUIREMENTS MET IN THE 1914 WAVERLEY

THE reasonable requirements of your fastidious customer will be found—where else, if not in a Silent Waverley.

WAVERLEY FRONT-DRIVE-FOUR—The classic lines, the approved dignity, the comfortable seating arrangement, the luxurious furnishing, the unrivalled spring suspension of the Waverley Front-Drive-Four—these are reasonable requirements, and yet where else will you find them all combined except in the Silent Waverley?

Take note of a single detail. The driver's seat revolves, permitting its occupant to leave or enter the car by the left hand door without disturbing the other passengers—significant of the care with which the fastidious customer's taste has been consulted in the 1914 Waverley.



WAVERLEY REAR-DRIVE-FOUR—Has your customer a preference for the sociable rear seat drive—a natural preference to which he has a perfect right? Where else will he find so wide a choice in seating arrangement? The Silent Waverley Rear-Drive-Four offers two—the usual arrangement of two double seats placed vis-a-vis, and the different plan shown in the illustration—a double rear seat with two revolving chairs in the right and left front corners.

WAVERLEY FOUR-CHAIR-BROUGHAM—These are both very practical and deservedly popular seat plans; but there is still another, that of the Silent Waverley Four-Chair-Brougham, the sociable car supreme, where the usual rear seat is divided into three separate, luxuriously upholstered chairs, the middle one placed slightly behind the other two for the sake of extra seat space (61 instead of 52 inches). The driver occupies the left hand chair with no one sitting in front of him and the fourth passenger has a folding chair in the forward right hand corner. This is the Waverley designer's happy arrangement to meet the very particular requirements of your *MOST* fastidious customers. Where else will you find its equal?

WAVERLEY BROUGHAM FRONT AND REAR DRIVE—Or again is your customer in doubt, as he has a right to be? The Silent Waverley Front and Rear Drive Brougham will give him the dual control preferred by some—the privilege, that is to say, of driving from either front or rear seat.

WAVERLEY LIMOUSINE-FIVE—For the customer who requires a larger car there is the Silent Waverley Limousine-Five, the electric de luxe, where the driver has not only a separate seat with full view ahead, but even a separate door for his special use.

The Silent Waverley Electric is so far from being a "standardized car" that every special need of the most fastidious purchaser will be found in one of its several different models.

SPRING SUSPENSION

Digitized by Google

THE Waverley SILENT Electric

SEVENTEEN YEARS OF LEADERSHIP

BEHIND the name, the Silent Waverley, is an interesting story—a story of leadership in every department of coach design and electric engineering.

WAVERLEY—THE PIONEER ELECTRIC

The electric exhibited at the first American show
The first electric with direct geared drive
The first electric with successful shaft drive
The first electric coupe
The first electric limousine
The first electric with full view ahead
The only electric with four separate chairs
The only electric with low center of gravity
The only electric with low entrance
The only electric with long wheelbase
The only electric with no battery under seats or floor

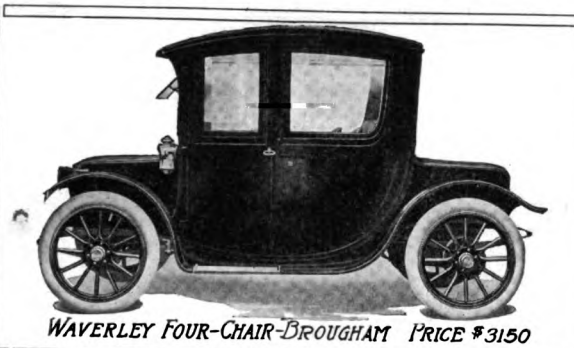
The Silent Waverley has been not only the pioneer electric in every forward movement—it has seen many of its features first condemned then imitated in practice.

WAVERLEY HERRINGBONE GEARS—From the first the Silent Waverley Electric has been equipped with Herringbone gears while many experiments have been made with chain drives, bevel gear shaft drives and worm gears.

Nevertheless, the highest authorities among gear experts have continued to maintain that for strength, quiet running qualities and high percentage of efficiency, the Herringbone gear is the best of all gears.

Efficiency tables put out by leading parts manufacturers of bevel and worm gear drives show the lower the horsepower the lower the efficiency, and compared with the gas car the electric is always a machine of extremely low horsepower. The efficiency of Herringbone gears shown by test in Silent Waverley Electrics is 98.7 per cent., the same as in a 40 or 4000 horsepower transmission.

Waverley gears have been right from the start while experimenters have been shifting from one form of drive to another.



WAVERLEY, FULL ELLIPTIC SPRINGS—In its spring suspension as well as in its power transmission the Silent Waverley leads all other electrics. Full elliptic springs with torsional supporting side springs, as applied in the Waverley, insure greater riding ease than will be found in any motor vehicle, choice of solid, cushion or pneumatic tires.

If you, Mr. Dealer, are thinking of adding an electric to your present line of gas cars you will make no mistake if you investigate first and foremost the Silent Waverley Electric. We are not cutting our commission to dealers.

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street NEW YORK CITY

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

Rushmore Electric Lighter and Starter

Regal

Left Hand Drive—Center Control

*Model "T"—5 Passenger Underslung Touring Car—**$1125***

Scientific Care of Every Detail— Secret of *Regal Quality*

THE New Series of Regal Cars has increased our reputation as builders of automobiles of quality. This fact is now recognized by dealers and consumers the world over.

And the secret of Regal Quality is—*scientific and conscientious care in the construction of every single detail.* Thus, perfect details result in pefect Regal Cars—automobiles of utmost efficiency, long-life, power, beauty and economy.

The new Regal Cars are *finished products*—complete in every detail of mechanical construction and body beauty. They actually *look like* cars costing $2000 or more because of their refinement features and external appearance.

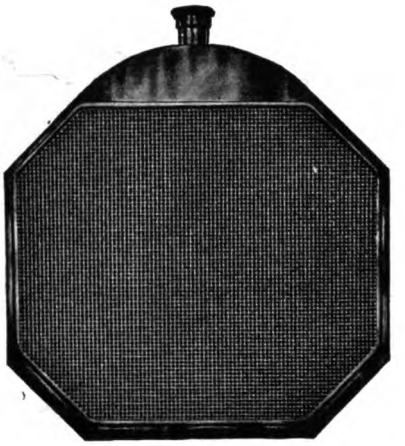
Every desirable advancement is found in these new cars. No more motor car value can be purchased anywhere this year for such prices.

Values Offered You—

We have incorporated the efficient and positive Rushmore Electric Starter and Lighter as standard equipment on all Regal Cars. The desired left hand drive and center control have been adopted. Other features of our standard equipment are: Electric headlights, with dimming attachment. Long, low, sweeping body lines with cowl dash. Starter, lighting and speedometer switches on instrument board. Special adjustable curtains. Rain vision and ventilating windshield. Demountable rims. Tire irons. Foot throttle and muffler cut out.

The New Series—

Our New Series includes Model "T", a large and beautiful 5-Passenger, underslung, touring Car at $1125—Model "N," an efficient, speedy, underslung roadster, $1125—Model "NC," an elegantly finished and appointed, underslung coupe selling at $1600 and Model "C," a big, powerful, 5-passenger overhung car for $1350. The underslung values of extreme safety, economy and beauty are developed to the highest point in our Underslung Models.



Dealers—Write Today

We desire wide-awake, aggressive dealers in certain territory still open. You may be just the right man. We give our dealers excellent co-operation and unusual factory service. Write or wire us for our New Series Literature, *with complete specifications and prices*, and our attractive dealers' proposition.

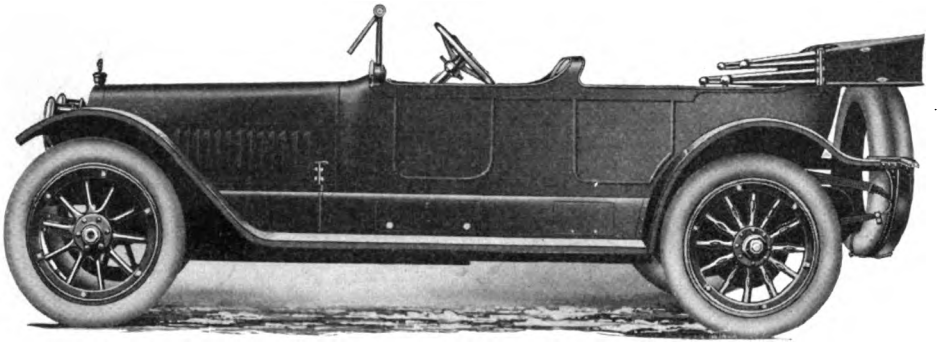
Literature sent to prospective purchasers on request.

Regal Motor Car Co. 263 Piquette Avenue, Detroit

Digitized by Google

OUR departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.

We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.



Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky inefficient radiator and a "superheated" customer, then be sure this car was *not* equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

Two New Stearns-Knight Models—Distinctive in Design and Construction

Stearns-Knight Six-Cylinder Six-Passenger Touring Car

FEATURES of body design never before seen in any American car distinguish the new Stearns-Knight four- and six-passenger touring cars. The upholstery and trimming are radically different from the ordinary type, without losing any of the comfort and luxury for which Stearns-Knight cars are famed. Smooth, dull leather, crossed by leather bands with buttons at intersections—the seats flanked by rounded arm rests—produce an unusual effect of roominess and comfort.

The auxiliary seats of the six-passenger type combine an equally unusual design with increased facility in handling. Practically invisible when not in use, a slight pull upward places them in position—the work of a moment only.

Other features of these new cars—the cowl-back of the front seats—the absence of upholstery above the edges of the body—the "one-man" quickly-operated top and convenient curtains—and many other details, combine to make these cars exceptional in appearance and in utility. Combined with the wonderfully efficient Stearns-Knight motor and chassis, they represent the best of all that is new in motor car design.

DEFENSE or TRIBUTE

The Cost of Each

The price of the Ellis Gasolene Purifier is $3.50, prepaid to anywhere in the United States.

Measure the outside diameter of fuel feed pipe and give dimension with order.

To install, cut section same length as Purifier from fuel feed pipe, thread ends of pipe and screw Purifier on.

Once in use, drain the Purifier once a week or so by turning thumb screw on under side of Purifier. This is all there is to the only defense there is against carburetor trouble.

This is all there is to the only defense there is against carburetor trouble.

Carburetor trouble levies its tribute on every motorist. They have to pay this tribute constantly, and in the lifetime of a car it bulks up in an alarming manner. Not alone in money, but in time and worry does so-called carburetor trouble exact its tribute. It affects a car's efficiency, maintenance, as well as the owner's enjoyment in a score of other ways.

The manufacturer and dealer feels some of the burden of this exaction. The carburetor is always a weak point in an otherwise perfect car. Its tribute is a good deal like blackmail, this so-called carburetor trouble. All pay tribute for relief, but it is only temporary. Is there no remedy—a permanent, lasting remedy for "carburetor trouble"? There is, if you go about it right. ***Carburetor trouble is a misnomer. It is the fuel's fault.*** Impurities in commercial gasolene cause the trouble. They overshadow any carburetor's ability to perform its work. Fix the fuel and stop paying tribute.

The Ellis Gasolene Purifier

is a patented device consisting of a series of screens and filters which, when tapped onto the fuel feed pipe, intercept every particle of dirt or sediment commonly found in gasolene. It also traps and disposes of any and all water which invariably accumulates in a carburetor.

The greatest benefit of an Ellis Gasolene Purifier is that in filtering all impurities from gasolene, it allows the carburetor to do its work free and unhampered by impurities in fuel which it is incapable of handling. The cause of 90% of carburetor trouble lies in the fuel. The Ellis removes the cause of "carburetor trouble" and effectively defends its users against manifold troubles, worries and expenses.

Price of Defense Against Carburetor Trouble $3.50

Hupmobile

TWO or three weeks ago Hupmobile dealers from all parts of America and Europe as well came together in convention at the factory to see this new car.

And one man swept the convention by saying what everyone else had thought but had not said.

For ten minutes he had been telling of the hold of the Hupmobile on his big Western territory; and the crowd went wild when he suddenly drawled, by way of climax:—

"Boys—when yuh talk to me about competition — I — don't — know—what—yuh—mean. I never met up with it!"

And do you know, my dear sir—you who are thinking of buying a car—that this dealer merely expressed a condition that exists everywhere?

Stop and think—have you ever heard any but kind words of the Hupmobile?

Isn't it always spoken of separately—by itself?

Isn't it always singled out, and not grouped, as other cars are grouped together in a low priced class?

And do you know why?

Why This 1914 Car Is Unique and Alone

The Hupmobile is in a class by itself because it has a sturdy pressed steel frame.

The Hupmobile is in a class by itself because it has a pressed steel Pullman body.

The Hupmobile is in a class by itself because it is the biggest user of aluminum of any moderate priced car.

The Hupmobile is in a class by itself because it is the biggest user of high priced steel of any moderate priced car.

The Hupmobile is in a class by itself because it has a powerful long-stroke motor, 3¼ in. x 5½ in.

The Hupmobile is in a class by itself because it has an individual, distinctive design.

The Hupmobile is in a class by itself, in other words, because by its careful and exhaustive attention to the most intimate details of construction—and by its use throughout of the finest materials obtainable, no matter what the cost, it has justified our belief that it is the best car of its class in the world.

Hupp Motor Car Company, 1254 Milwaukee Ave., Detroit

"32" Touring Car or Roadster—$1050 f. o. b. Detroit

In Canada, $1250 f. o. b. Windsor

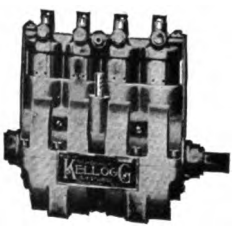
Packard, Peerless, Winton, Stevens-Duryea, Lozier, Stearns, Palmer-Singer, Havers, Franklin, Chalmers

and the makers of many other high grade cars use and highly endorse the

Four Cylinder KELLOGG Tire Pump

Because the makers of these cars have used the Kellogg for four years and found it to give consistent and satisfactory service;



Because they have found the Kellogg the only power air pump good enough to become a part of their equipment;

Because the Kellogg's four cylinders do not strain the motor or gears;

Because the Kellogg is quick in action, reliable at all times, and never permits oil to enter tires;

Because the Kellogg is the best power air pump ever placed on the market.

Manufacturers, Dealers, Car Owners

Attachments are supplied for installing the Kellogg in practically any model of any car now in use or announced for 1914.

Write for our book—"Air On Tap." Learn what the Kellogg will do for you—how it will make money for you.

The Starter that works directly on the flywheel, eliminating all the intermediate mechanism commonly associated with engine starters.

The pinion on the armature shaft engages the flywheel gear when the switch button is pressed, turns it, and slips automatically and silently out of mesh the instant the engine starts.

The RUSHMORE STARTER

Two sizes—"A," for the largest engines; "B," for medium sized engines. The Rushmore Dynamo is as automatic, free from mechanism, and reliable as the starter.

RUSHMORE DYNAMO WORKS
Plainfield, N. J.

Dixon's GRAPHITE TRANSMISSION GREASE NO. 677

This exactly right combination of grease and fine flake graphite is the most economical transmission and differential lubricant a car owner can buy, because it has the lasting quality which no other oil or grease affords. The fine flake graphite imparts this permanent quality, identifying itself with the metal of gears and bearings in an almost frictionless veneer that minimizes wear and noise. "Lubricating the Motor," No. 23, will solve your bearing problems.

COX OXYGEN CARBON CLEANER

New
Thorough
Quick
Inexpensive
Harmless
Efficient
Necessary
Profitable

The first really efficient and thorough method of cleaning carbon out of the cylinders is the new Cox Oxygen Carbon Cleaner. It consumes every particle of carbon, even in corners where it could never be scraped out, without the slightest possibility of harming the cylinders.

It takes from 6 to 10 minutes to clean each cylinder, averaging 30 minutes for a four-cylinder motor and 45 minutes for a six. Any workman can do it. Does not require experience or expertness. Absolutely safe to handle.

For Public Garages

The profit possibilities for you in the Cox Oxygen Carbon Cleaner are only limited by the number of your customers. You do the work in one-tenth the time and only a fraction of the cost of any other method. Motorists will pay you well to clean their cars regularly. It is just as necessary as washing the car. This new method will quickly establish the custom of regular cleaning.

For Large Private Garages

For private garages in which more than one or two cars are kept, the Cox Oxygen Cleaner is a good investment. It pays for itself in the greater economy and improved running of the car.

Write Us Today

and we will prove that your profit per cylinder is almost gross—that you can actually pay for the carbon remover several times over inside of a week—this has been done.

Get the information—read the detailed facts—learn still more about the integrity and responsibility back of the house that guarantees every claim made for this—the only REAL carbon cleaner.

You can't short circuit J-M (MEZGER) SOOT-PROOF SPARK PLUGS Prove it with this test

These plugs are absolutely soot-proof. Prove it yourself by holding one in the flame of a candle or lamp until the end is covered with soot. THEN place it in your engine, turn on the power, and it will positively CLEAN ITSELF!

The secret is in the porcelain insulator, or "petticoat," which extends to the END of the plug.

This porcelain becomes so hot at the tip that carbon is burned up the instant it settles. No soot—hence no short-circuit.

Over 400,000 high-class cars are now equipped with the J-M (Mezger) Soot-Proof Spark Plug.

Many of these plugs are still in service after 8 years of use.

GUARANTEE

The J-M (Mezger) Soot-Proof Plug is backed by a five-million-dollar concern with a fifty-five year record for square dealing. If any plug does not give satisfactory service, we will supply a new one or refund purchase price.

Shipped direct from our nearest Branch if not sold by your dealer. Price $1.00. Write for interesting Booklet.

Shaler Vulcanizers will not be included in any 1914 car's equipment

Look over your stock. How many accessories of real utility do you see which are not furnished in some form with the car?

The Shaler Line of vulcanizers for motorists and garages remains the one standard line of accessories on which the car manufacturer does not compete with the accessory dealer.

A reliable vulcanizer is a necessary part of EVERY motorist's equipment. Tire trouble is the motorist's weak point. It's easy to sell him something that will eliminate it.

Most motorists are familiar with Shaler Vulcanizers in a general way because they have read our advertisements. When they came in and complain about tire troubles, it's up to you to suggest a Shaler as a sure remedy. Sell vulcanizers to them with the understanding that it's a "make-good-or-money-back" proposition.

There are Shaler Vulcanizers for every possible requirement of motorist and garage, from the $2 Vul-Kit for mending a tube puncture now and then, to a complete garage plant.

Equipping automobiles with

Vitalized Rubber

Diamond Tires

Squeegee Tread

is selling rubber shod satisfaction

Perfect car control

The motorist who equips his car with Diamond Squeegee Tread Tires enjoys driving at all seasons—he can turn sharp corners and make emergency stops with perfect control of his car and absolute freedom from "forward" or "side" skids.

And this assured safety costs nothing extra, because after the Squeegee Bars are worn from long service, there still remains a strong, thick, tough tread made of More Mileage Vitalized Rubber.

Built for long wear

The discovery of the process that vitalizes rubber so as to strengthen the pure gum with no loss of elasticity—puts into rubber additional mileage that the user gets out in service—has saved Diamond Tire users thousands upon thousands of dollars

All types of Diamond Tires are made of Vitalized Rubber, so why not eliminate possible short mileage and continual "adjustments" by selecting "Diamonds"—the tires that make good for everybody everywhere.

For freedom from skids and increased mileage

Equip with Diamond Tires

BEST FOR AUTOMOBILES, BICYCLES AND MOTORCYCLES

59 Klaxonized Cars

The old fashioned bulb horn is known to be inadequate. Car buyers demand a more efficient signal. Car makers have had to meet this demand.

There are two ways in which this has been done.

ONE is by supplying an electric "buzzer." This is the lowest type of signal that can be called an "electric horn."

There are many of them on the market that can be bought by car makers for $1.25 to $2. This is even less than the cost of a bulb horn.

Buzzers rarely have a name. If they do, the name plate is usually removed. The signal itself is often placed under the hood — out of sight.

All this is done that you may NOT find out too much about them. If you ask the salesman he usually says it is "like a Klaxon" or as "good as the Klaxon."

The chance is taken that you DO NOT KNOW ABOUT WARNING SIGNALS; that you may not have had sufficient motoring experience to know the difference between the "buzzer" type of electric signal and the Klaxon.

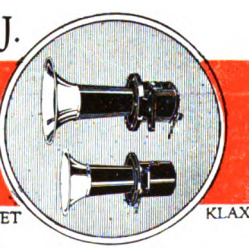
THE OTHER WAY to meet the demand for an adequate signal is by supplying the Klaxon

Fifty-nine car makers already Klaxonize their cars. The list of them is itself the unanswerable indication of the Klaxon's standing. You find in it, every high-grade car made in America.

These makers are paying from four to eight times as much for Klaxons, Klaxonets and Klaxets as they would have to pay for cheap unknown "electric horns."



This that you may have the best signal equipment possible to provide—the recognized STANDARD — the signal you KNOW about — that invariably bears the name-plate of its manufacturers — who guarantee its permanently satisfactory performance.

Lovell-McConnell Mfg. Company, Newark, N. J.

Two dollars a year

GRAY & DAVIS
STARTING-LIGHTING SYSTEM

EXPERIENCE

For fourteen years we have produced automobile lamps. Our electric lamps have won international standing. Our entire efforts are devoted to building electrical equipment for automobiles. We are specialists in this field; we do nothing else.

Five years ago we produced the first dynamo which put the electric lighting of automobiles on a successful and practicable basis.

We next studied the application of this same electrical power to the operation of a starting motor and the combination of this motor with our lighting system. *It was a natural progression—not a new problem.*

Here the *experience* of our designing and producing staff assumed vital importance.

For twenty-two years the chief of our Electrical Engineering Department designed direct current generators. Sixty per cent. of all electric automobiles you see today are equipped with motors designed by him.

In adapting our system to different cars, the experience of the head of our Mechanical Engineering Department was of great value. This man spent years in designing and building one of America's leading cars.

The man who superintends the actual production of our automobile equipment has built electric dynamos and motors for fifteen years. Under him hundreds of skilled electricians and machinists work in our plant, which is the largest and most completely equipped factory of its kind.

Before leaving the factory, each Gray & Davis dynamo or motor must meet an efficiency test, an overload test, and a fatigue test to determine whether it is possible to break down the system. These tests are 50 per cent. more drastic than the worst possible road tests.

And afterward—when the system is in actual service on a car, the Gray & Davis Service Department stands back of the motorist. Directing this department is a man who has had twelve years' experience in electrical service work. Under him are sixty-two Service Stations throughout the country. Each one is in charge of a practical electrical expert. One of these stations is within easy reach of every motorist in the United States.

Two years' experience with the Gray & Davis Starting-Lighting System, installed in various makes of cars and operated under every conceivable condition, has proved that it long ago passed the experimental stage and that it successfully meets every starting and lighting requirement.

The Gray & Davis Starting-Lighting System is found on leading American cars in every price class. Remember that the makers of these automobiles were buyers when they adopted the Gray & Davis System. They brought their engineering experience into play to enable them to select the best system to offer as part of their standard equipment.

We will be pleased to send catalog on request

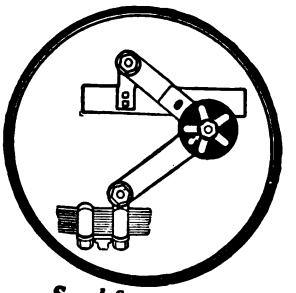
The Only Real Way to Cut Tire Cost



An ordinary emery wheel, revolving at high speed, "plays hob" with any resisting substance brought in contact with it.

And when a rear tire in passing over a rough road rebounds clear of the surface, its revolutions while freed of its load are increased tremendously. In the slowing down process that must necessarily follow when traction is again resumed, the tread is seared and wastefully ground away.

In this instance it is the tire as the weaker substance that must yield. The wear and tear on its casing from just one such occurence as this is almost as much as the total tire wear on a full day's run.

These illustrations are cited to emphasize the vital importance of eliminating the violent spring rebounds that throw the wheels of the car in the air. Continual contact with the road surface is essential to full service from your tires and *possible* only through the use of Truffault-Hartford Shock Absorbers.

These absorbers do actually keep the wheels of the car *on the ground.*

Send for catalog

The excessive spring rebounds are stopped. Greatly increased tire mileage is a certainty and those parts of the car that suffer most at the hand of jolts and jars, are prolonged in life.

Apart from these actual economies—representing a saving that is a hundred times greater than the cost of Truffault-Hartford equipment—these absorbers make comfortable motoring a reality on roads of every description. No other motoring accessory contributes more to the comfort and economy of car owners than the

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer and the Best"

Can any car manufacturer claiming "full equipment" for 1914 afford to omit this device—a device which has already become standard equipment on twenty-five leading American cars? And can any man afford to buy a car that does not include this *necessity* to the greatest comfort and car economy? Five models including the New Automatic, ranging in price from $15 to $60 per set of four.

Firestone
Truck Equipment

Solves the Problem of The "Extra Tire"—the "Emergency Replacement"

Firestone Quick Removable Rims are the key to the situation. Simply because they really *are* easy to remove and replace. Any driver can make a replacement in a few minutes—or, in the case of a heavy truck, any driver and his helper.

Our local service station will change over the wheel equipment of your trucks promptly. Then you will be *insured* against costly and annoying delivery hold-ups.

The Firestone service stations are in all large cities, and they are the most efficient in the business. All Firestone equipment is built to S. A. E. standard. So, regardless of your present equipment, we can serve you best, whatever your tire requirements may be.

No equipment, however, can give you *full efficiency*, no matter what service you get, except the simple Firestone Quick Removable Equipment.

Let a Firestone man call and talk it over. Let him show you the various types of Firestone tires and give you the benefit of his knowledge and experience, in selecting the style best suited to your needs. It is in this way that you will eliminate your truck equipment difficulties and insure yourself—

Vol. XXXVII New York, U. S. A., Thursday, October 30, 1913 No. 6

JOHNS-MANVILLE TO MARKET JONES SPEEDOMETER OUTPUT

Having Added Mezger Spark Plug to Its Line, Big Company "Goes into" Speedometers—To Take Over Entire Jones Sales Dept.

Evidence that the H. W. Johns-Manville Co., of New York, is bent on becoming a factor in the automobile accessory trade which must be reckoned with at all times, continues to accumulate. As one of the largest manufacturers of asbestos products, its brake lining long since gave it standing in the automobile industry, but it was not until it added spark plugs that the trend of its policy was made plain. It was made still more distinct when, five weeks ago, it acquired the C. A. Mezger Soot Proof spark plug and took over the entire sale of that article.

Even more surprising, and making wholly clear its intentions with regard to automobile accessories, the Johns-Manville company has just completed negotiations whereby it will market the entire output of Jones speedometers. The arrangement becomes effective November 1st, when the Johns-Manville people will take over the entire Jones sales department, of which A. J. Interrieden is sales manager, but whose health is such that four months ago he had to seek the climate of the Adirondacks, where he is still recuperating. The head of the Johns-Manville sales department is L. R. Huff.

With the worry of marketing his product off his mind, J. W. Jones, the inventor of the speedometer, will be able to devote himself solely to its manufacture in his factory in New Rochelle, N. Y., which, of course, will be continued.

As the Johns-Manville company maintains 47 branches, and also has approximately 500 selling agencies, that it is positioned to make its influence felt in any line of endeavor is apparent. The work of expanding the scope of the business is claiming the personal attention of T. F. Manville, the president of the big comporation.

Lewis Reenters Automobile Manufacture.

When, in February last, William Mitchell Lewis relinquished the presidency and general management of the Mitchell-Lewis Motor Co., of Racine, Wis., and was succeeded by James Winterbotham, Jr., the direct representative of the bankers who had floated the $2,500,000 note issue, it was stated that Lewis thereafter would devote himself to the Racine Rubber Co. and a newspaper in which he was interested. Like many other similar statements, however, it proves to have been more diplomatic than correct, as it now transpires that since his retirement Lewis has been engaged in the formation of another company for the manufacture of automobiles. Formal announcement of the fact was made early this week when the Lewis Motor Co., of Racine, capitalized at $250,000, was incorporated with William Mitchell Lewis and Rene Petard as the chief incorporators. They will manufacture a medium-priced light "six," deliveries of which are promised February 1st.

Date Set for New York Dealers' Meeting.

November 20th has been set as the date for the meeting at which a State association of New York automobile dealers will be brought into being. It will occur in the Hotel Ten Eyck in Albany. The Automobile Dealers' Association, of New York City, which is leading the movement, has already retained counsel and a tentative plan of organization is being prepared.

Reliance Speedometer Registers Zero.

The Reliance Speedometer Co., of Boston, Mass., has filed a voluntary petition in bankruptcy and is in the hands of a receiver. Its liabilities are $29,564 and its assets $7,146. The largest unsecured creditor is the Daniel H. Newton Estate, whose claim, for money advanced, amounts to $18,926.

BAD YEAR FOR POPE LEADS TO A THIRD RECEIVERSHIP

Stockholder and Creditor Take Action as Initial Step in Rehabilitation of Business — Maturing Notes Precipitate Crisis.

Not unexpectedly, the Pope Mfg. Co., of Hartford, Conn., went into the hands of a receiver on Monday last, 27th inst. The receiver, who was named by Judge Tuttle sitting in the State Superior Court, is Col. George Pope, treasurer of the company, who is also president of the National Association of Manufacturers and treasurer of the Automobile Chamber of Commerce. His bond was placed at $200,000. Col. Pope was also to be named ancillary receiver by the Massachusetts court, the company having a bicycle and motorcycle plant in Westfield, Mass., but action in that State has been deferred.

The receivership was quite clearly forecasted by the annual report of the Pope company, which was made public early this month, and which showed that this year's operation had netted a loss of $67,551, as against a profit of $251,290 during the previous fiscal year.

The report, which covered the 12 months ending July 31st, placed the company's assets at $9,090,081.76, of which $3,734,109.95 are represented by patents, good-will, etc., $2,506,960 by real estate, buildings, machinery, etc., and $1,688,747 by material and other stock on hand.

Its liabilities, exclusive of outstanding stock to the value of $6,019,000, totaled $2,971,081.76. Of the latter sum, $1,000,000 was represented by gold notes, due April 1st next, $510,000 by loans payable and $534,314.67 by accounts payable — three items which, coupled with the dates of maturity, clearly indicated the proximity of a receivership.

The application for a receiver was filed by one merchandise creditor and one stock-

Digitized by Google

holder of the company, who acted in an endeavor to conserve the assets and prevent drastic action on the part of unfriendly creditors, of whom there are a few.

Both factories are being operated as usual, and it is confidently expected that the creditors will be paid in full and that the stockholders will receive a substantial dividend on their holdings, or will be put in a position to reorganize the company on favorable terms.

One report attributed at least part of the embarrassment to differences existing between what were described as the Pope and Walker interests in the company, when, as a matter of fact, complete harmony has always prevailed at all times. Indeed, the Walker interests, represented by Charles E. and Wilbur Walker, vice-president and secretary, respectively, are purely nominal. Both of the Walkers have been identified with the company for very many years, Charles E. having risen from the position of the late Col. Albert A. Pope's office boy to his present post of vice-president.

This marks the third occasion when the Pope Mfg. Co. has been in the hands of a receiver. Established in the late 70's by Col. Albert A. Pope, it became the largest producer of bicycles in the world and was at the top of the heap wher it became a part of the $40,000.000 American Bicycle Co., the so-called bicycle trust, which was organized in 1899 and which went broke in less than two years later. It was reorganized under the style American Cycle Mfg. Co., of which Col. Albert A. Pope became president, but the ill-starred enterprise again went into bankruptcy and Col. Pope purchased what was left of the enormous wreck, including his original plant in Hartford. He again operated it as the Pope Mfg. Co. and when the automobile first showed signs of promise he promptly embraced it, being the chief factor in the Electric Vehicle Co., whose cars, like Pope's bicycles, were named Columbia. Later he also produced the Pope-Toledo in Toledo, O., in the same plant which proved the nucleus of the present Willys-Overland group.

The Pope company continued to produce bicycles, and later motorcycles, in large quantities, but somehow or other its dipping into gasolene was followed by a succession of financial stringencies of which the present, as stated, is the third. According to reports that are current, when reorganization is effected this time, the gasolene, that is, automobiles, will be left out.

Oakland Plans Factory Enlargement.

The Oakland Motor Car Co. has placed contracts for an addition to its plant in Pontiac, Mich. It will be a three-story structure, 70 x 70 feet.

CHASE PREPARES TO BUILD A GASOLENE TRACTOR PLOW

Truck Maker Has Spent Three Years on Device—Will Build Additional Factory—Capital Added Last Year for This Purpose.

Having developed a gasolene traction plow, which it has been bringing to perfection for some three years, the Chase Motor Truck Co., of Syracuse, N. Y., is now making active preparations to manufacture and place it on the market. This intention, it is stated, was the real meaning of the company's increase of capital from $150,000 to $300,000.

The increase was authorized last year, but the additional capital has since been held in the treasury pending final demonstrations of the practicability of the plow, thorough tests of which have been conducted on the Hazard farm in Camillus, which is close by Syracuse, as well as on several larger farms in the West.

The $150,000 added capital which is in hand will be used for the purpose of constructing a plant in Syracuse specially for the production of plows, which, however, will in no way interfere with the company's output of trucks.

Grossman Recognizes Barber's Patent.

The Emil Grossman Mfg. Co., of New York City, having purchased an interest in the William Barber spark plug patent, No. 732,032, the suit recently instituted by Barber in the United States District Court for the Southern District of New York against the Lowe Motor Supplies Co., also of New York City, probably will be discontinued within a few days; the Lowe company was sued on the grounds that the Red Head plug—made by Grossman—which it handled infringed the Barber grant, and the Grossman company has seen fit to recognize merit in the complainant's invention and patent.

Barber's patent claims to cover a plug wherein the insulation is of two separate pieces, one piece brittle porcelain and the other of a less brittle material. Other suits were filed at the same time against retailers of Sootless and V-Ray plugs.

Square Horn Discloses its Ammunition.

Having been directed by the United States District Court for the Southern District of New York to specify the patents and instances of priority upon which it intends to stand in the action brought aaginst it by the Lovell-McConnell Mfg. Co. for alleged infringement of the Klaxon horn patents, Nos. 923,048, 923,049 and 923,122, the Square Horn Mfg. Co., Inc., this week filed a bill stating these particulars.

The American patents which it is claimed cover and antedate the Klaxon invention are: Bapst and Falize, 384,412, June 12, 1888; A. N. Pierman, 620,958, March 14, 1889; and A. H. Gould, 785,874, March 28, 1905. English patents: Hope Jones, 26,737, of the year 1901, and Geiseler, 21,084, of the year 1900. Instances of prior use: Wagle motorphone, 1882, in Germany; Alden T. McMurtry, of New York, who applied for patent No. 251,901, March 24, 1905, and used his device before that date. The company also cites its own invention as a prior use.

The Salvini Electric Horn Mfg. Co., Inc., which is closely allied with the Square Horn company, filed a similar bill in a similar suit brought against it on the same grounds.

Bad Year for Canada's Biggest Maker.

Attributing it to the necessity of making its Knight engine in Canada, and of effecting other important changes, and the delay incident thereto, the Russell Motor Car Co., of Toronto, by far the biggest automobile enterprise in the Dominion, reports a net loss of $152,826 for the fiscal year which ended July 31st. Last year the company paid a dividend of $180,127, dividends of 7 per cent. on the preferred and 3½ on the common having been disbursed, according to the annual report, which made its appearance last week. As the profit balance of $303,233 was brought over from last year, there still remains a balance of $38,307. Dividends, it is announced, have been suspended until further notice.

Court Confirms Sale of Cutting Assets.

The referee in bankruptcy has confirmed the sale of the plant and equipment of the Cutting Motor Car Co., in Jackson, Mich., which, as stated by Motor World last week, was bid in by the Harris Bros. Co., of Chicago, who guaranteed the purchasers $35,000 and who also assumed encumbrances amounting to $30,000 more. The property had been appraised for $268,653.

Not the least interesting feature of the receiver's sale was an offer of $25 made for Bob Burman's big Cutting racing car. Needless to add, it was refused.

Auction Sale Marks End of Middleby.

The property of the Middleby Auto Co., of Reading, Pa., is due to be sold today at auction. Although the company never cut a very large figure in the industry, it is possessed of 478 separate lots of machine tools and other machinery, apart from a considerable quantity of finished and unfinished parts of the Reading Forty automobile.

THROPP, TIRE MOLD MAKER, TAKES WHACK AT U. S. TIRE

Beaten by Fisk in Suit Over "Wrapped Tread" Mold Patent, Strikes in New Direction—Charges Duplication of Device.

Even though it lost in a four-year legal fight against the Fisk Rubber Co. over their "wrapped tread" tire mold patent, No. 822,561, granted June 5, 1906, The de Laski & Thropp Circular Woven Tire Co. and the John E. Thropp's Sons Co., of Trenton, N. J., evidently have determined to strike in another direction; this week they filed suit in the United States District Court for the Southern District of New York against the United States Tire Co., alleging that the latter infringes the patent, which was granted to Peter D. Thropp.

The invention "relates more particularly to apparatus holding a clincher tire in position during the vulcanizing process," and is made and leased for use in the manufacture of what has become known in the tire trade as a "wrapped tread." The suit against Fisk was carried to the United States Circuit Court of Appeals, which confirmed the victory won by Fisk in the lower court. The Fisk defense was based largely upon prior uses by the B. F. Goodrich Co. of a tire mold, and the court failed to agree with Thropp's claim that these were mere experiments.

In its bill of complaint in the action against the United States Tire Co. the Thropp companies state that Ernest Hopkinson, of East Orange, N. J., now a United States Tire attorney, and Thomas Midgley, of Hartford, Conn., who has an embedded-wire tread tire named after himself, applied December 19, 1905, for a patent covering the same thing previously patented by Thropp. Their patent was granted October 13, 1908, under the number 901,006, and later was assigned to the Hartford Rubber Works Co.

September 15, 1906, they claim that Charles L. Pepper, of Indianapolis, applied for a patent covering the Thropp invention, which application and all interest in the invention were sold to Morgan & Wright. The United States Tire controls both of these corporations and is therefore made the defandant. The Thropp companies claim their application antedates both these other applications and that in an interference proceedings in the patent office many of the Thropp claims were recognized as having priority over those of the other applicants.

Despite these alleged facts, the Thropp companies claim the defendant has made and used infringing molds which has greatly damaged the Thropp companies' business.

Koehler's E-M-F Suit Finally Settled.

An echo of the days when the names Everitt, Metzger and Flanders were first linked as manufacturers of a car was heard this week in the Supreme Court for New York county when an action instituted nearly four years ago by the H. J. Koehler S. G. Co., of New York City, against the Everitt-Metzger-Flanders Co. was settled.

The suit was the outgrowth of Koehler's dealership in E-M-F cars during the selling year of 1908-9; after his contract had expired he claimed the manufacturing company had failed to furnish enough cars to fill orders he had secured, and he demanded $100,000 to compensate him for lost profits on these uncompleted sales. The terms of the settlement were not made public beyond the bare statement that the sum paid to the Koehler company was "substantial."

The settlement was made by the Studebaker Corporation, which took over the E-M-F and rechristened it Studebaker, finally replacing it with a thoroughly Studebaker model.

Lamb Abandons His Ohio Truck Project.

Inability to sell sufficient stock has caused the National Motor Truck & Mfg. Co. to abandon its purpose of erecting a plant in Gibsonburg, O. The project was fathered by Frank E. Lamb, who once was connected with Gramm Motor Car Co., of Lima, O., who has washed his hands of the affair, having resigned the offices of president and general manager. The other officers are: A. T. Crossett, first vice-president; C. H. Hutchinson, second vice-president; John O'Leary, secretary, and J. A. Nieset, treasurer.

Woodard to Leave the Woods Electric.

O. J. Woodard, sales manager of the Woods Motor Vehicle Co., of Chicago, has resigned that position, his resignation taking effect January 1st next. Except that he purposes spending several months in recreating in Southern California, Woodard, who, until he "went into" Woods electrics, was for many years high up in the Diamond Rubber Co.'s sales department, has no definite plans for the future.

Fulton Moves from Iowa to Wisconsin.

Having incorporated under the laws of Wisconsin with an authorized capital of $25,000, the Fulton Co., maker of the Aermore exhaust horn, has removed from Marshalltown, Ia., to Milwaukee, Wis. Its new plant in the latter city will be located at 726 National avenue.

INTERNATIONAL WRANGLE IS CARRIED TO SUPREME COURT

Minority Stockholders Check Mortgage Proceedings by Asking for Receiver — Basis of Fraud Charge—Calder Retires.

Those minority stockholders who, on a technicality, were barred from last week's meeting of the International Motor Co., of New York, made good their threats to take the matter into court, and they lost no time in doing so.

Their action took the form of an application, on Thursday last, to the New York Supreme Court in Brooklyn, not only for an injunction restraining the authorization of the desired and very necessary $1,200,000 mortgage, but for the appointment of a receiver and the winding up of the concern.

A temporary injunction was granted but the court declined to appoint a receiver without further argument, and at a second hearing, held yesterday, Judge Garrettson indicated that he was not favorable to making the injunction permanent nor to the appointment of a receiver. He will consider additional briefs today.

Meanwhile, things have happened within the inner circle of the big company itself, John Calder, who only recently assumed the presidency, resigning that office and being succeeded by Vernon Monroe, former secretary of the corporation, the latter office being added to the duties of B. A. Guy, treasurer.

The minority stockholders' complaint, filed in the name of George E. Blakeslee, of Jersey City, who holds 400 shares of International stock, alleges that the directors were arranging for the placing of the $1,200,000 mortgage without consulting the interests of the stockholders, that proper notification had not been given him and that his every effort to obtain information had been met by rebuffs.

Alleging that fraud had been committed when the Mack and Saurer truck companies were merged into the International Motor Co., it was stated that, while an appraisal of the Mack concern's assets showed a net tangible value of $1,250,000, the Saurer had only between $4,000 and $5,000 worth, according to one auditing concern. This company held that the annual minimum royalties, running from $20,000 to $40,000, which must be paid to the holder of the Saurer patents represented an actual liability aggregating over $300,000. The Saurer interests maintained that, as the payments were deferred, they should not be included in the list of liabilities. The whole charge of fraud simmered down to the

Digitized by Google

point whether the royalty payments should be considered a liability. Judge Garretson said he thought they should, but did not make any final decision.

It was alleged by the complainants that, although the Mack company owned the largest part of the International's assets, the old Mack interests were almost entirely ignored by the Saurer people, who assumed control of the International, and appointed as its managers friends and relatives who had no real knowledge of the automobile business.

It was brought out that instead of executing a $1,200,000 mortgage as planned, the controlling faction of the International company now wants to borrow $500,000 at once and $500,000 additional in the near future, in order to carry on its operations. It was stated by attorneys for the defence that creditors, including banks, holding obligations aggregating $2,100,000, have agreed to defer their claims until the International is in better shape to pay them. In addition to the $2,100,000, the company owes $350,000 on merchandise bought.

It was further held by the defendants that the minority had brought a misjoined suit, and that the court had no power to appoint a receiver since it was not the International company that was directly concerned in the basic agreement but rather certain individuals.

The minority claims that the new loan is wanted to reimburse the large stockholders who loaned the International $1,500,000 in 1912. This was denied, however, and it was asserted that it would be made on an actual 6% basis without any bonus being given to anyone. Of the 1912 loan it was testified only $675,000 was available for working capital, the balance being needed to meet outstanding obligations. It was admitted that the International has been losing money this year and must have additional funds.

In the original consolidation stockholders of the Mack company were given $125 of International preferred and $187.50 of common stock in exchange for each $100 of Mack stock owned, while the Saurer company was taken over for par at $600,000. Its assets were appraised as of August 31, 1911, at $514,992, and stockholders made up the difference of $85,000 in cash.

Sale of Schacht Assets Not Completed.

Having disposed of the equipment and stock on hand, the receiver has fixed November 10th as the date on which the real estate and buildings of the Schacht Motor Car Co., of Cincinnati, will be offered for sale. The other property was disposed of piecemeal and brought fair prices, many individuals bidding in the 40 cars that were put up.

"GOES BROKE" TRYING TO CUT EXPENSE FOR OTHERS

Delivery Supervision Concern Ends its "Truck Watching" Career in Bankruptcy—Leased Meter to Record Truck Movements.

Claiming that the assets are but $30,000 and the liabilities $75,000, three creditors Saturday, 25th inst., filed a petition in bankruptcy against the Delivery Supervision Co., of 733 7th avenue, New York City; the creditors and claims are: American Taximeter Co., $44,329; W. E. Pruden Hardware Co., $28; Webb Mfg. Co., $67. It is charged that the company has admitted its inability to meet its obligations and has made preferential payments.

The company was incorporated January 15, 1913, with a capitalization of $1,000,000 and took over the business of the International Supervision Delivery Co. It made and leased a meter which records the time and distance traveled and the speed of a commercial vehicle. It maintained a department which reported to truck owners the record of each truck daily, and while it has 2,000 meters valued at $30,000 out at lease, it found that this part of the business was not profitable. The other assets consist of dies and tools in the possession of and on which the Regina Co., of Rahway, N. J., claims a lien. William M. Lybrand was appointed receiver, and it is stated that some of the creditors believe a satisfactory plan of reorganization can be worked out.

New Receiver Named for Inter-State.

Growing out of its action in filing a voluntary petition in bankruptcy in the State court, as stated in last week's Motor World, three creditors of the Inter-State Automobile Co., on Thursday last, filed a petition in bankruptcy in the United States District Court in Indianapolis which led to the appointment of Rollin Warner, an attorney, of Muncie, as receiver. The latter will supersede Michael Broderick, who was appointed by the State court. The three creditors who acted in the matter are Margaret Jenks, of Port Huron, Mich., Union Drop & Forge Co., of Chicago, Ill., and the Merchants' Delivery Co., of Muncie. Their claims aggregate $6,660.70.

Fischer Carries Flexible Shaft Higher.

Charles Fischer, who holds a patent on a flexible shaft, is hopeful that the appeal of his infringement suit against the Automobile Supply Mfg. Co., of Brooklyn, N. Y., which was argued this week in the United States Circuit Court of Appeals in New York City, will result less disastrously than it did in the lower Federal court in Brooklyn, which dismissed the complaint when it came before him last January.

Fischer's patent is No. 969,660 and was granted September 6, 1910, to Franz Schmidt and Albert Grundmann, of Berlin, Germany, and has undergone several assignments since its issuance. It claims to cover a shaft which is made of a tightly coiled wire surrounded by a coiled metal strip, coiled in the same direction and fitting into the depressions between the coils of wire. The Automobile Supply Mfg. Co. is best known as a manufacturer of horns, among them the Newtone.

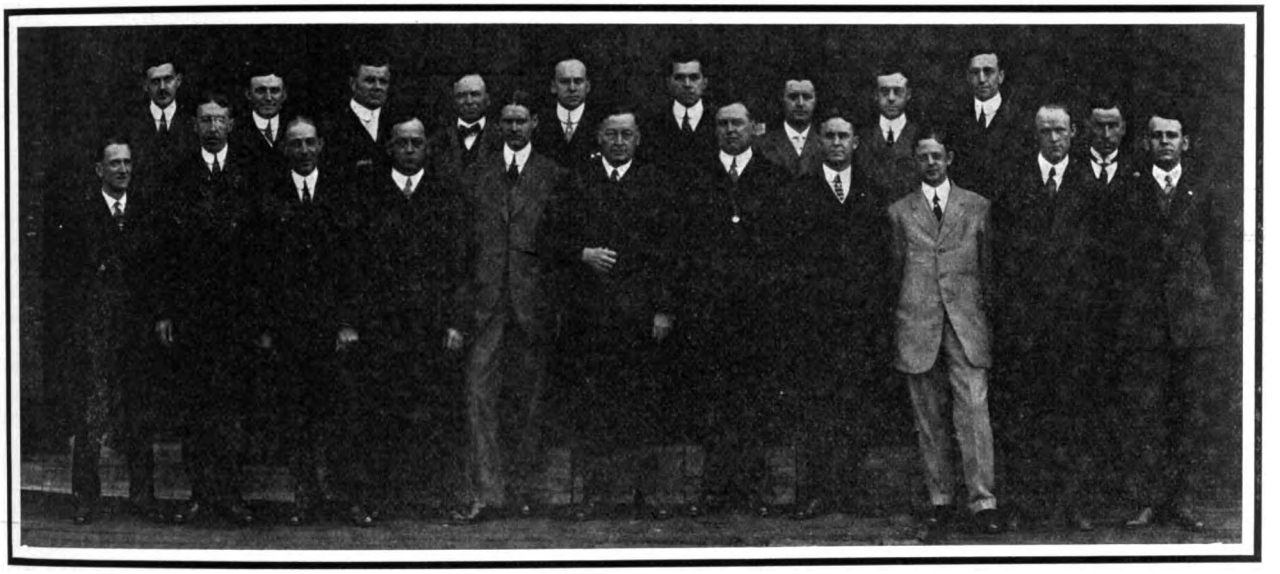
Laciar Gets Part of What he Asked.

Robert J. Laciar filed suit a year ago for $15,000 against the Jackson Motor Co., Jackson dealer in New York, but when his case was disposed of last week in the Supreme Court for New York county the sum was cut to $1,685; Laciar claimed he contracted July 1, 1912, to be sales manager, that his salary was to be $3,600, that unless he disposed of 25 cars by October 1, 1912, the contract might be cancelled, that if he disposed of 400 cars by February 1, 1913, his salary was to be $5,000 a year, and that this was to carry with it a commission of $10 a car. He stated that he sold 190 cars by October 1 and that the company cancelled his contract the next day, whereupon he sued.

Date Set for Sale of R.C.H. Assets.

November 11th has been set as the date for the receiver's sale of the assets of the R. C. H. Corporation of Detroit. The property will be offered both in parcels and in bulk. According to the latest appraisal, it is valued at $807,197.61, of which $201,000 is represented by real estate and buildings, $213,889.75 by plant equipment and machinery, $313,968.28 by material, supplies and branch stocks, $14,530 by cars, $60,634.58 accounts receivable, and $3,175 notes receivable.

British Car Maker May Build in Canada.



James Warren, managing director of the Peerless Motor Co., of Birmingham, Eng., has opened an office in Montreal and has taken steps toward the formation of a $500,000 Canadian company for the reproduction of British Peerless cars in the Dominion. G. F. Evans, a former railroad man, has been appointed general manager of the enterprise.

Houghton Dealers Meet Bankruptcy.

A voluntary petition in bankruptcy has been filed by Burt Williams and Thomas Seecombe, who traded in Houghton, Mich., as the Houghton Automobile Agency; liabilities are $6,745.65 and the assets $2,840.

ELECTRIC MAKERS ELECT AND DISCUSS MANY TOPICS

Frank W. Smith Succeeds Arthur Williams as President at Annual Convention in Chicago—Long List of Papers Read.

What is undoubtedly the largest gathering of members of the Electric Vehicle Association of America took place on Monday, 27th inst., in the La Salle hotel in Chicago, Ill., the occasion being the fourth annual convention of the organization. The outcome of the election placed Frank W. Smith, vice-president of the United Electric Light & Power Co., of New York, in the president's chair, relinquished by Arthur Williams, who is general inspector for the New York Edison Co., who, however, was elected a member of the board of directors. Smith was vice-president of the association and his place is taken by J. F. Gilchrist, of the Commonwealth Edison Co., of Chicago; Harvey Robinson, of the New York Edison Co., and Day Baker, New England manager of the Edison Storage Battery Co., were re-elected secretary and treasurer, respectively. On the board of directors, both Wm. P. Kennedy, consulting transportation engineer, and W. G. Bee, vice-president of the Edison Storage Battery Co., were re-elected, and C. N. Stannard was elected to serve his first term.

Following out the set program, Dr. E. E. Pratt, manager of the industrial bureau of the Merchants' Association of New York, opened the first business session with a paper entitled "Traffic Problems and the Automobile," in which he laid great stress upon the necessity for cooperation, rather than antagonism, between the law makers and the general public. Following Dr. Pratt, F. Nelson Carle presented a paper entitled "The Merchant, the Central Station and the Electric Truck," and this was followed by a paper entitled "Cooperation Between the Electric Vehicle Manufacturer and the Central Station," by E. L. Callahan. On Tuesday, the session was opened by M. R. Berry of the Electric Products Co., whose topic was "Charging Storage Batteries in Unattended Garages."

The remainder of the set program included talks by G. H. Kelly and E. J. Bardell of the Baker Motor Vehicle Co. on electric vehicle salesmanship; C. A. Duerr, of Gimbel Bros., and D. L. Tobias, of the United Electric Light & Power Co., on the electric vehicle in department store service; Bruce Ford of the Electric Storage Battery Co. on recent developments in the lead battery for vehicle work; and F. A. Whitney of the Commercial Truck Co. on electric commercial vehicle tires. Except for "time out" for theater parties and a dinner ,the whole of the two days of the convention was devoted to set papers.

"Model Bookkeeper" and $5,000 Missing.

Search is being made for Thomas A. Payne, formerly of 2300 North Springfield avenue, Chicago, who until September 18 was cashier of the Haynes Motor Car Co., of 1792 South Michigan avenue; following his disappearance an examination of his books is said to have revealed a shortage of $5,000, and Harry R. Doty, superintendent of the Haynes company, has sworn out an embezzlement warrant, naming that amount. Payne was regarded not only as a "model bookkeeper" but as a "model young man."

Splitdorf Incorporates Two Branches.

The Splitdorf branches in both Detroit and Chicago have both been transformed into separate corporations, the former styled Splitdorf Electrical Co. of Detroit and the latter the Splitdorf Electrical Co. of Chicago. The officers of the former are C. E. Brelsford, president; H. J. Finley, treasurer and manager, and W. J. Murray, secretary. The officers of the Chicago establishment are R. S. Preble, president and manager, and E. A. Kelley, secretary and treasurer.

Typhoon Blows from Chicago to Lincoln.

The Typhoon Signal Co. has completed its removal from Chicago to Lincoln, Ill., where its new plant just has been completed and where the manufacture of the Typhoon $4 electric horn will be conducted on a large scale. R. P. Hartenstein remains president of the company and J. F. O'Brien secretary and treasurer. The superintendent of the plant, however, will be a new man, Morton G. Bunnell, who for 26 years was superintendent of the Austin Mfg. Co. of Chicago.

Advertising Account Leads to Judgment.

A verdict for $1,022.87 was given to the Van Cleve Co., a New York advertising agency, against the Abbott-Detroit Motor Co., of New York, in the Supreme Court for New York county last week; the amount represents an advertising account. The Abbott company was the metropolitan distributer of that line of cars until relations between it and the Detroit company were severed several months ago.

Losey Oakland Manager at Minneapolis.

R. H. Losey, who for many years has been identified with the Buick interests, has been appointed manager of the Minneapolis branch of the Oakland Motor Car Co. He succeeds J. W. Martin.

AMERICAN POSSESSIONS BUY LESS CARS FOR MORE MONEY

High Cost per Car Brings Total Value up 10 per Cent. and Number Down 8 per Cent. in August—Philippines the Largest Buyer.

The non-contiguous American possessions, which are not included in foreign export statistics by the Federal statisticians, bought more cars for less money in July of this year, but in August the tables were reversed, the possessions buying fewer cars for more money as compared with August of the previous year. The number of cars purchased decreased from 96 to 88, but the value rose from $121,876 to $134,770, a gain of $12,894, or 10 per cent., in value and a loss of 8 cars, or 8 per cent.

Another reversal of conditions in the two months is that whereas the average value of the cars decreased by $290 in July, it increased by $262, or 20 per cent., in August. In August, 1912, the average cost was $1,269 and in August, 1913, $1,531. The Philippines continue to lead as buyers of American cars, taking 59, valued at $79,301. It made the only substantial gain, also, increasing its takings by 30 cars, or 104 per cent., and $47,739, or 151 per cent. The average price paid by the Philippines was $1,344 in August of this year and $1,088 in August, 1912, an upward movement of $256, or 23 per cent. Hawaii and Porto Rico both lost. Parts fell from $23,886 to $23,544, a loss of $342.

The export of tires is given for Hawaii and Porto Rico only and is as follows: Hawaii, August, 1912, $22,245; 1913, $39,603; gain, $17,358, 78 per cent. Porto Rico—August, 1913, $19,728; 1913, $46,043; gain, $26,315, 133 per cent. The figures in detail follow:

	August 1912 No.	August 1912 Values.	August 1913 No.	August 1913 Values.
Hawaii—Cars	42	$60,519	16	$39,522
Parts*	..	7,551	..	3,909
Porto Rico—Cars.	24	28,595	11	13,897

In the RETAIL WORLD

John Howard has opened a garage in Las Vegas, N. M.

Louis D. Baer, of Owensboro, Ky., will build a garage and repair-shop.

H. Tysinger, of Little Rock, Ark., plans to open a garage and repair-shop.

Arthur Greenlee is securing estimates on a garage to be erected in Hutchinson, Kan.

J. E Carson has opened salesrooms in the Pearce Garage in Macomb, Ill. He stocks Fords.

Ezra Connell, of Scranton, Pa., plans to build a garage on Clay avenue; it will cost $4,000.

Daily Bros., of Lincoln, Neb., are building a garage; it is located at 19th and O streets.

Arthur L. Smith, of Santa Maria, Cal., has transferred his Cadillac agency to the Crescent Garage.

Horace Rainey, of Columbia, Tenn., is about to erect a garage; the site is on South Garden street.

Heydt & Haas, of Reading, Pa., are about to erect a garage at 413-15 Washington street; it will cost $5,000.

The Moon Motor Co. of Illinois has taken possession of new salesrooms at 2612 Michigan avenue, Chicago.

Joseph Griffin & Co., of Mountain View, Cal., have taken over James Small's garage; possession was given immediately.

J. A. Huhn and George A. Maro, of Glendora, Cal., plan to build a garage on Vermont avenue; the cost will be $5,000.

E. R. Prittle, of Phoenix, Ariz., plans to build a garage on Center street; it will cost $34,000. He is State distributer of Cadillacs.

The Henry L. Walker Co., of Detroit, has taken possession of new quarters at 185 Jefferson avenue; the company handles Woods electrics.

The Diamond Garage Co., of Pittsburgh, Pa., has been granted authority to erect a one-story garage on Burd street; the estimated cost is $6,500.

William Bennett, of Peoria, Ill., has purchased the Illinois Garage, formerly occupied by C. W. Robinson; he handles gasolene and electric cars.

Middlesex Automobile Co. is the style of a new business in New Brunswick, N. J. It has located at 88 Albany street; George L. Burton is a principal in the corporation.

The Brockway Motor Truck Co., of Cortland, N. Y., has opened a branch in New York City at 250 West 54th street; a service department is attached to the establishment.

The Jackson Auto Sales Co., of Houston, Tex., has taken possession of new salesrooms at 1311 Main street; the Van Allen Tire Supply Co. is also a new tenant of the same building.

The Brazill Garage has been opened in Newton, Mass., on St. Mary street, near Commonwealth avenue; it is 100 x 100 feet and its equipment includes a turntable in the center of the floor.

A. S. Karesh and T. J. McDaniels, of Walterboro, S. C., have formed the Walterboro Auto Co. They will operate a garage in a building formerly occupied by the Collenon Auto Repair Co.

Royston Welch, of Oconomowoc, Wis., is about to open a garage; he will locate in a remodeled building on Milwaukee street, which before it was destroyed by fire last spring was a livery stable.

J. J. Harter, G. W. Patee and O. W. Chalfant, of Sac City, Ia., have formed the Harter Auto Co. and have purchased of S. M. Elwood the garage formerly occupied by Harter; they plan to erect a new building, 66 x 132 feet.

B. E. Bauer has sold his interest in the Elroy (Wis.) Garage & Machine Works to his partner, R. E. Gibbons, who will continue the business under the same name; Bauer will reenter the garage trade in Sterling, Kan.

The Blue Ribbon Auto & Carriage Co., of Bridgeport, Conn., has taken possession of the building on Fairfield avenue formerly occupied by the Bellamore Carriage Co. This structure contains about 80,000 feet of floor space.

Eugene McKenna, of McKenna's stables, is erecting a garage and repair-shop in Baltimore at 810-14 East Lexington street; this affords accommodations for 80 cars and McKenna is considering converting his stables into a garage also.

Fay N. Fuller, formerly of Elkhorn, Wis., has resigned as assistant manager of the Ford Motor Co.'s branch in Fargo, N. D., and will enter the trade for himself in Williston, in the same State; he will trade as the Williston Motor Co. and will distribute Fords.

Charles Burd, of Waterloo, Ia., has leased the garage and salesrooms formerly occupied by the Iowa Auto Co. and will remove his sales business to that location; his former quarters will be retained as a garage and service statiton. Burd stocks Empire and Cole cars.

The Bryant Motor Car Co., of Waterloo, Ia., has purchased a site on 5th street, between Washington and South streets and will erect a two-story garage, 50 x 120 feet; the company stocks Chalmers cars. Frank Bryant, the proprietor, formed the company four years ago.

J. F. ("Jack") Kelly and R. G. Melcher, both well known in the trade in Chicago, have formed the National Auto Maintenance Co. They have located at 2511-19 South State street and their business will consist of keeping individual owners' cars in repair for a stipulated sum per year.

Bowman & Libby, Inc., of Minneapolis, have been made distributers in a large territory for Marion cars; the company also handles Overlands and has been made distributer of Garford cars and trucks and Willys utility wagons as well in the same field. The company claims to be the second largest Overland distributer in the world.

Frank D. Stoop, of 127 1st avenue East, Kalispell, Mont., has purchased the Kalispell Auto Co.'s garage, 50 x 140 feet; he plans to add 25 feet on one side for salesrooms and additional storage space, and will install a vulcanizing plant, air compressing system, welding outfit and other equipment. He handles Studebakers and Hudsons.

Capt. J. Mott Williams, of St. Petersburg, Fla., has taken possession of a two-story garage and machine-shop recently erected at 3rd avenue and 3rd street South; it is styled Williams Garage. It cost $30,000 and affords 12,000 square feet of floor space. A seven-room apartment, occupying part of the second floor, is tenanted by Williams and his family.

The Detroiter Motor Sales Co., Inc., has

Digitized by Google

been formed in New York City to act as wholesale distributer of Briggs-Detroiters in New Jersey, New England and Eastern New York State; Julius Lichtenstein, who is connected with other metropolitan motor car enterprises, heads the new business. K. C. Pardee, Inc., continues as metropolitan retailer of Briggs-Detroiters.

Arthur Routh, of the Routh Packing Co., and Arthur Grund, of the Auto Repair Shop, have formed the Oakland Sales Co. in Galesburg, Ill. They have located at 126 6th street, and besides handling Oaklands will operate a day and night livery and a repair shop.

S. B. Ebersol and Ray Hinch, of Marseilles, Ill., have formed a company which has taken over the Marseilles Auto & Supply Co. and the Ebersol Motor Car Co. The new company, which will use the Marseilles company name, is erecting a new building, 60 x 100 feet, with a basement 24 x 60 feet, on Young street. The structure will cost $5,000. The company will handle several lines of cars.

Edward McK. Hunt, New Jersey distributer of Stewart trucks, and the Ingle Motors Co., New Jersey distributer of Brown commercial cars, have merged and adopted the style Ingle-Hunt Motors Co. The new company has secured a garage, salesrooms and service station at 16-18 Shipman street, Newark, and besides handling the two lines of trucks will specialize in used trucks of from 1,000 to 3,000 pounds capacity.

The garage, repair and supply departments of the Boone Auto Co., of Boone, Ia., have been taken over by J. W. Erickson, of Boone, and A. G. Olson, formerly of Boxholm, in the same State; they will retain a part of the Boone company's building and will operate under the style Erickson Auto Supply Co. The Boone company retains its automobile sales business. Erickson previously was an employe of the Boone company.

George W. Hawkins, widely known in the trade in and about Houston, Tex., has sold his interest in the Hawkins-Halff Co., of 1120 Main street, to his partner, G. A. C. Halff; the company name may be changed to Halff Co. Hawkins has not announced his plans for the future. Halff will assume active management of the company, control of which carries a majority interest in the Thompson-Halff Co., of Waco, the Alamo Sales Co., of San Antonio, and the Halff Co., of Dallas.

The Electric Vehicle Service Co., with $5,000 capital, has been organized in Saginaw, Mich., to operate an electric garage; a building will be erected. H. H. Meyers, formerly of Toledo, O., will be superintendent. The officers and directors are: President, Allan Jackson; vice-president, J. P. Beck; secretary and treasurer, J. H. Wagner; directors, the officers and Theodore Huss and W. O. Sustins. Besides these, the organizers include S. J. Bolton, John A. Cleveland, E. R. Griggs, J. A. Weigel, and E. T. Eastman.

Recent Losses by Fire.

Greensboro, N. C.—American Motor Car Co., garage, tires, accessories and ten cars destroyed. Loss, $10,000.

Virginia, Minn.—H. Shannon; garage and two cars destroyed. Loss, $5,000.

San Diego, Cal.—Savage Tire Co.; plant damaged. Loss not stated.

Holliday, Utah—Cheeseman Garage; destroyed. Loss, $20,000.

Moto Bloc Sues Mt. Vernon Service Man.

For supplies furnished to Henry C. Fordham, who operates in Mt. Vernon, N. Y., as the Westchester Motor Service Co., the Moto Bloc Import Co., of New York City, has filed suit in the Supreme Court for New York county; it claims Fordham ran up a bill of $325.15 between March 3 and August 28, 1913, and has paid but $163, leaving a balance of $162.15.

Smithtown Garageman Called to Court.

The Century Tire Co. this week filed suit in the Supreme Court for New York county against Edward C. Baxter and Albert R. Meade, who trade in Smithtown, N. Y., as the Smithtown Auto Co. The suit is for $528.85 for goods supplied between September 1, 1912, and June 10, 1913.

Rubber Importer Given $2,800 Verdict.

De Lagotellerie, a crude rubber importing concern, was given a verdict of $2,836.23 this week in the Supreme Court for New York county against the Automobile Tire Co. The amount was asked upon a note which was given De Lagotellerie by the tire company and not paid at maturity.

Complaining Buyer Gets Six Cents.

Because he claimed an Everitt "48" which he bought early in 1912 from the Tanner Motor Car Co., of Brooklyn, N. Y., was not worth the $1,800 he paid for it, Isaac J. Cohn was given a verdict of six cents this week in the Supreme Court for New York county; he asked $1,000.

Regrets He Paid "Cable Tire's" Rent.

Timothy F. Scannell apparently thought so well of the Cable Pneumatic Tire Co., of New York City, that he paid its office rent for two years at 102 West 42d street; the amount was $1,000 and the tenancy ran from August 1, 1909, to August 1, 1911. This week he took judgment for $1,087.21 in the New York City Court, claiming the money never was repaid.

Ajax-Grieb Wants Albany Man to Pay.

The Ajax-Grieb Rubber Co., of New York City, brought suit this week in the Supreme Court for New York county against the Consalus Auto Co., of Albany, N. Y., for $306.90, alleged to be the balance due on a bill of goods supplied between January 1 and March 30, 1913. Victor E. Consalus is the company's president.

Judgment the Result of a Truck Sale.

Because Otto B. Moody and George H. Hinton, who operate the New York & Yonkers Auto Dispatch, failed to pay for a Garford truck, judgment was taken against them this week in the Supreme Court for New York county by the R. & L. Co., Garford dealer in New York City; the amount is $2,200.

Firestone to Establish Branch in Iowa.

To facilitate the distribution of Firestone tires in that part of the West, the Firestone Tire & Rubber Co. is preparing to establish a branch and service station in Des Moines, Ia. As yet, no suitable building has been found, and if further efforts prove unavailing the Firestone company will erect its own branch.

Asks Herkimer Garageman to Settle.

The Indian Refining Co. this week filed suit in the Supreme Court for New York county against George T. Lewis and John T. Murphy, who operate in Herkimer, N. Y., as the L. & M. Garage; the claim is for a balance of $274.96 on goods supplied between May 8 and July 19, 1913.

Humphrey, of Hupp, Gets New Title.

S. H. Humphrey, factory manager of the Hupp Motor Car Co., of Detroit, has been elevated to the extent of having the title "manufacturing manager" bestowed upon him. The new title carries with it jurisdiction over the Hupp factories in both Detroit and Canada.

U-S-L Combines Sales and Service.

The United States Light & Heating Co. has removed its New England branch from 84 State street to 25 Irvington street, Boston. The effect of the removal is to bring the U-S-L service station and sales office under one roof.

Fugitive Manager Returned to Chicago.

Arthur V. Webb, formerly manager of the American Auto Supply Co., of Chicago, who was arrested in England on a charge of embezzlement, has been returned to Chicago to stand trial; it is charged that he decamped with $2,800.

WHY NOT AN ELECTRIC HEATER?

Strangely enough, inventors and others have paid remarkably little attention to the possibility of producing some sort of small electric heater suitable for use in the tonneau of a car—a device that can be placed in the open market and purchased at a reasonable price by any one seeking comfort during the winter months.

Electric devices to keep the driver's hands warm are comparatively common; which makes plain the feasibility of developing an electric heater for other purposes. That there is a demand for such a device is emphasized by a prominent New York accessory dealer, who declares that he has had many inquiries for one and would have not the slightest difficulty in disposing of a large number of them provided they were efficient and not too expensive.

The car owner really wants something of the kind. Undoubtedly the idealistic simplicity of the electric heater, which can be put under any number of layers of robes and which cannot cause a fire, has much to do with the demand for it. And now that electric lighting and engine starting equipment is standard on so many cars the need of the electric heater, long ago felt in a lesser degree, is real and urgent.

Most lighting systems provide plenty of current for operating an electric heater, particularly where the car is driven not very much at night. A good many of them, in fact, provide a considerable excess of current that ordinarily goes to waste. Why not put it to some good purpose?

ABOUT PUTTING MOTORISTS IN JAIL.

It begins to look as if the Hon. Mitchell May, Secretary of New York State, who has charge of its automobile bureau, never, never will be happy until he puts a few motorists in jail.

He continues to keep himself in the limelight by reiterating the necessity for that sort of thing, and none will disagree with him that there are motorists who deserve cold storage behind iron bars. But just why the Hon. Mr. May cannot visit the punishment upon them instead of constantly talking about it is one of the things that is difficult to find out.

There certainly are laws enough on the books to achieve the result, and perhaps if Mr. May talked less and brought the weight of his influence to bear on the courts it might prove more effective and keep more of breath in his body.

His chatter again suggests the question: How did Secretaries of State manage to keep busy—regardless of keeping in the spot lights—before automobile bureaus were invented and attached to their offices?

MINORITY STOCKHOLDERS NOT UNBLEST.

Minority stockholders on occasion can become very contrary "critters," as several of the larger corporations identified with the automobile industry, among others, recently have borne witness. Minorities usually amount to little more than unpleasant breaths, but for all of that they serve good purposes.

Big men dominating big corporations are too prone to believe themselves all powerful and to conduct affairs accordingly. It is not meant to say that they conduct them unfairly or wrongly, but the great power which reposes in them sometimes is abused, and even more often leads to more or less reckless extravagances of one sort or another. It is then that the objecting or inquisitive minority stockholder; despite his apparent cantankerousness, proves a blessing in disguise. He assists in bringing the "big fellows" back to earth and causes them to be more circumspect in spite of themselves.

REMARKABLE STRENGTH OF PARTS TRADE.

Quite the most remarkable feature of the present situation in the automobile industry is the wonderful strength exhibited by the parts and accessory trade. Despite the long succession of embarrassments and reorganizations which have overtaken car and truck manufacturers, the parts makers have stood almost as solid as a stone wall.

Whether it is due wholly to the ampler financial resources, smaller investments, or to the diversity of their products and the greater number of their customers cannot be said, but whatever it may be, the fact remains. In the face of distress which has given rise to no little pessimism, the health of the parts and accessory trade deserves remark and constitutes an inspiring example.

RAINBOW OF PROMISE SEEN IN PRICE-CUTTING CLOUDS

Manufacturers to Work for Restoraton of Right to Fix Resale Figures —Redfield Buoys Hopes of Foes of "Price Slashing."

The United States Supreme Court in its ruling in the Sanatogen case held that the manufacturer has not the power to fix the resale price of his goods, but indications are not lacking that the right to tell the retailer what he shall charge for the manufacturer's goods may be restored to the latter in the not distant future. As it stands now, the law forbids price maintenance, but agitation for a different law is under way and may bring results.

One of the latest and most favorable indications in this direction comes from no less a personage than Secretary Redfield of the Department of Commerce and Labor, who in an address last week before the Board of Commerce of Lansing, Mich., stated that if funds were available the department would in the coming year institute an investigation into the price-fixing situation with the object of ascertaining the advisability of working for a law permitting this practice.

"The decision of the Supreme Court holding it to be unlawful for manufacturers to fix retail prices settles the present law, but the wisdom or unwisdom of the law and economic profit or loss by the practice are not yet settled," said Secretary Redfield. "There are men who are sincere foes of monopoly and who incline to the belief that, under economic laws, which are greater than statutes, the broad prohibition of the right to fix retail prices by manufacturers tends to create monopoly, instead of toward relief from monopoly.

"There is no thought of questioning the decision. It is the law of the land, and as such it is bound in letter and spirit to be accepted and obeyed. For the guidance, however, of future legeislation on this important subject it is desirable that the economic question be worked out."

The merchandizing development may constitute one of the chief points in discussions before the next Congress upon this phase of business, and data bearing on the situation will be presented by the National Fair Competition League which had its birth immediately following the Sanatogen decision. This league maintains an office in New York and is working in several different lines toward the restoration of fixed resale prices.

How legalized price-cutting works out is well explained by an attorney who has been engaged for some time in combatting price cutting on a certain manufacturer's wares. "Fixed resale prices are the little business man's only salvation," he asserted. "It is the only way in which the big chains of retailing stores can be prevented from crushing out the 'little fellows' and the small business men are coming to see it more and more.

"The corporation which operates a big chain of stores can sell goods at a smaller margin of profit than can the 'little man' and if the 'little man' attempts to meet their price they can cut below cost in certain localities, still do well on their profits in other cities and slowly but surely put the small, independent store out of business. But if prices are fixed by the manufacturer and the retailer is compelled to maintain these prices, the chain stores cannot sell for a cent less than can the small, independent store and the small store has an even chance for existence. Price-cutting does not prevent monopoly; it creates monopoly."

Charges Mismanagement in U. S. L.

If they are not coming into their own, the minority stockholders of the big corporations are certainly making themselves heard nowadays. One of them, George W. Baxter, of Knoxville, Tenn., has issued a letter to other holders of stock in the United States Lighting & Heating Co., in which he alleges mismanagement.

"I am not satisfied with the policy pursued by the present management in failing to make any statement to stockholders or to give them any information except of the most general character," says Baxter. "Its securities are selling at the lowest prices in the history of the company; its indebtedness is as large or larger than ever before, and, as you know, the payment of dividends on the preferred shares was suspended last July. I was recently informed by the treasurer of the company that the net earnings for July were $8,000 and for August $6,000, which, I submit, is a pitiable showing for a company of this magnitude and doing the volume of business that it does."

An officer of the company said yesterday that owing to the absence of President Smith in Europe no statement in reply could be made yet. It was said that, while the surplus for July and August was no more than $14,000, it stood in contrast with a deficit of $5.040 in the same months last year.

Indianapolis Branch for Howe Rubber.

The Howe Rubber Co., of New Brunswick, N. J., which manufactures the Clover Leaf inner tube, has opened a branch in Indianapolis. It is in charge of E. L. Welsh.

FIRST BIG DALLAS SHOW IN ILLUMINATED FOREST

Sixty-five Different Makes of Cars Displayed by Thirty-eight Dealers on State Fair Grounds—Exhibitors and Their Wares.

For the first time, the city of Dallas, which as every one knows is in the State of Texas, has a real automobile show all its own; it has had small shows before—sporadic attempts of a few dealers to emulate the National events—but this is the first real show, promoted by Dallas dealers in a body and housed all under one roof. The Dallas Automobile Dealers' Association is responsible for it, and it will hold the boards for a record run; it was opened on October 18th, in conjunction with the Dallas State Fair, and will not close its doors until November 2nd.

In point of number and variety of exhibits, the Dallas show is second to few; some 65 different makes of cars and commercial vehicles are displayed by 38 dealers; altogether there are about 156 vehicles on exhibition and they include everything from the poor man's runabout, otherwise known as the cyclecar, to the heaviest and most expensive limousines. The cars are displayed under a flat ceiling and between mural decorations depicting West Texas scenes. Otherwise, the decorations consist of rows of birch trees with hundreds of miniature incandescents cleverly let into the bark to give the effect of an illuminated forest. Strings of brilliant tungstens, dependent from the ceiling, supplement the softer glow of the half-concealed miniatures. The complete list of exhibitors and the wares they display is as follows:

Crow Motor Co., Crow; The Halff Co., Rauch & Lang electrics, Paige, Pierce-Arrow, Chalmers, Federal, Mack and Saurer trucks; Kissel Kar Co., Kissel Kars; Michigan Motor Car Co., Michigan and National; Davis-Turney Auto Co., Haynes and Stevens-Duryea; Inter-State Auto Co., Inter-State; Metz Co., Metz; Pathfinder Motor Car Co., Pathfinder and King; Hudson-Reo M. C. Sales Co., Hudson and Reo; Henderson Motor Car Co., Henderson; Franklin Motor Car Co., Franklin; Premier Motor Car Co., Premier; Olds Motor Works, Oldsmobile.

Studebaker Corp., Studebaker; Southwestern Motor Sales Co., Chevrolet, Staver, Empire and Chase trucks; White Motor Car Co., White cars; William T. Fulton, Wichita trucks; Lozier Motor Car Co., Lozier; Locomobile Co. of America, Locomobile; Tri-State Sales Co., Marathon, and Imp cyclecar; Jackson Motor Car Co., Jackson; Cameron Auto Co., Hupmobile and Oakland.

Overland Auto Co., Overland, Garford, Ohio electric and Willys-Utility and Garford trucks; Chandler Motor Car Co., Chandler; Buick Automobile Co., Buick; Munger Auto Co., Cadillac; Krit Car Co., Krit; Avery Co., Glide; Cole Motor Co., Cole; Texas Motor Car & Truck Co., Partin-Palmer and Commerce trucks; Westcott Motor Car Co., Westcott; Overstreet-Loveless Co., Detroiter.

Ford Motor Co., Ford; Padgett Bros., Velie; Maxwell Motor Sales Corp., Maxwell; Sacksteder-Potter Co., Marion; Mitchell Motor Car Co., Mitchell; Harrison Vernon Motor Car Co., Packard; Anderson Electric Co., Detroit electrics, Wilcox trucks.

Receiver for a Used Car Dealer.

Upon application of N. Pohly Myers, a receiver was appointed this week in the New York City Court for the Cooperative Used Car Co., which formerly did business at 250 West 54th street and later at 1700 Broadway, which location is now occupied by the Universal Auto Sales Co. Myers secured a judgment for $319.66 October 7 in the 5th District of the Municipal Court and preliminary to the appointment of the receiver the Cooperative's president, Louis R. Ezchel, was examined in supplementary proceedings.

Ezchel testified that the company was organized in January of this year by himself, Joseph B. Bauer and John C. Curtis with an authorized capitalization of $3,000 to deal in new and used cars; for the stock, all of which was issued, $1,000 in real money was paid in and the remaining payment consisted of the good-will of the incorporators. Ezchel said his experience of ten years in the automobile trade constituted valuable good-will, as did the four years' experience of Bauer in the tire trade.

But when it came to finding something which could satisfy Myers's judgment the search was not very successful. The company has not been in business for some time and has a bank account of only about $1.80. Several other judgments have been taken against it. Ezchel is an officer of the Universal Auto Sales Co., but he denies that there is any connection between the Universal and the Cooperative companies.

Purchasers May Assemble Own Cyclecars.

Chester S. Ricker, the consulting engineer who until recently was identified with the Henderson Motor Car Co., of Indianapolis, is said to be organizing a company to supply cyclecars in knocked down state. It is his idea that there are many purchasers who prefer to do the assembling of their own cars.

TRUCK FREIGHT RATES TO CALIFORNIA REDUCED 15%

Fifty Cents Less on Hundred Pounds but Light Wagons Are Not Included—New Schedules Effective December 1.

Lower freight rates on heavy commercial vehicles between eastern points and California terminals will become effective December 1, according to an adjustment secured by the General Traffic Department of the Automobile Chamber of Commerce; the reductions are 50 cents a hundred pounds in each case and amount to from 15 to 16⅔ per cent.

On pleasure vehicles and light delivery wagons the old rates remain in effect, the new rates applying to trucks (not including delivery wagons with closed tops), chassis for such vehicles, tractors and extra parts (finished or unfinished) but not including windshields, lamps, searchlights, speedometers, cyclometers and horns. The old rates were: 36-foot car, minimum 10,000 pounds; 40-foot car, minimum 10,000 pounds; 50-foot car, minimum 12,000 pounds—Group A, $3.30; B, $3.20; C., $3.10; D, E, F, G, H and J, $3. The new rates are: 36-foot car, minimum 12,500 pounds; 40-foot car, minimum, 12,500 pounds; 50-foot car, minimum 15,000 pounds—Group A, $2.80; B, $2.70; C, $2.60; D. E. F. G. H and J, $2.50.

In no case shall the charges for a carload shipment of trucks handled under these rates exceed the amount charged for a carload shipment of pleasure cars of like weight. The date when the reduced rates shall become effective to Northern Pacific Coast points has not been fixed.

Limits Cars to be Imported Under Bond.

Regulations governing the free entry for six months under bond of various articles of foreign manufacture have been issued by Secretary of the Treasury McAdoo; section 4 of paragraph 1 limits the privilege of free entry under bond of automobiles to such as are brought to the United States by non-residents for touring purposes or for the purpose of taking part in races or other specific contests.

Garage Owners to Test "Blue Law."

Stetson Bros., who operate a garage in Neponset, Ill., do not take kindly to a village ordinance which prohibits a garage being kept open on Sunday; they were arrested when they refused to comply with the law. When arraigned they waived examination and will carry the case to a higher court.

THE COST OF CARELESSNESS

How Broken Bolt Thrown on Garage Floor Cost $10.40 and Disgusted a Customer—Plan Installed to Prevent Repetitions.

Who would dream that a broken half-inch bolt, thrown on the garage floor by a careless workman, would cost the garage proprietors ten dollars and forty cents? It probably cost them a good deal more than that, but they are absolutely sure the amount named was the minimum.

It happened this way: First, the workman, after breaking the bolt in an attempt to get it out, threw it out on the floor in the middle of the garage. There it lay. Everybody passed it. There were lots of others like it. Cotter pins and broken lock nut washers and lots of hard metal odds and ends kept it company. The boys in the shop did not care what risk the firm's customers ran by driving into the shop. The proprietors were far too busy walking back and forth to the 'phone, chatting with customers and superintending the work to notice what was on the floor.

Bolt—Puncture—and More Trouble.

Mr. Green came after his car. It was out in the alley. To finish the job it was necessary to back it in to the shop. While looking it over Mr. Green discovered the half-inch bolt securely embedded in the rear tire. It had obviously just made its way through. The attention of the proprietor was called to the matter. He secured pliers and pulled out the bolt. The tire went flat. The customer, looking around, saw several other bolts like it on the floor—and naturally and correctly concluded that the garage was responsible for it. The proprietor could not but agree with the justice of his remarks and proceeded to change the tire. It seemed a very simple matter—just a puncture. It would be fixed in a minute.

But it wasn't. The tire was taken off and the tube removed for mending. It was put in the electric vulcanizer but the boy was not an expert at vulcanizing. He left the job for several minutes and when he came back the heat had burned a hole right through the tire.

It was decided to send for an extra tire of the customer's several blocks away. There was no pick-up wagon available, so a boy was sent. It took about 45 minutes for the boy to get the tire. Then it took about half an hour to place the tube in the new casing and get it on to the demountable rim. After this it had to be pumped up by hand and placed on the car. Altogether, it consumed about two hours' time of boy and assistant.

Itemizing and Repairing the Damage.

On top of it all, the shoe or casing of the tire injured had to be sent away for vulcanizing and the estimated cost was $3.25. When the dealer got to figuring, the trifling bolt was magnified into the following:

One new tube, 34 x 4	$5.95
Two hours time	1.20
Vulcanizing shoe	3.25
Total	$10.40

Any active man in his employ could have swept the floor and got it free from scraps in a very short time. But there was no regular plan for caring for the floors. The cost of not caring for them had never struck the proprietor so forcibly before. Then and there he adopted a system of supplying every workman with a tin pail for bolts and nuts. Then all the employes were called together, a brief sketch of the incident and its cost was given and a general order issued that will probably mean treedom from such incidents in the future.

Only the cost to the garageman in dollars and cents has been mentioned. Not a word has been said about the feelings of the customer waiting for his car. He was so disgusted with the shop and its careless appearance that he was afraid of the job—suspicious of the charges—and glad to get away from the place. In his mind he registered a vow never to come back.

No comment is necessary.

PROVING IT POSSIBLE TO SELL CARS EVEN WHEN RAIN FALLS

It was a miserable, wet day, the third in a series of miserable, rainy days. The salesman walked to the window and looked out with eyes keen to detect the slightest indication of a change. But, if anything, the weather seemed to be growing worse. Half-heartedly he picked up his prospect cards and ran through them.

"By George!" he ejaculated. "There's Dickinson. I'd almost forgotten him. He ought to be ready now. I'll call him up and perhaps he'll talk to me this morning."

It did not take long to get Dickinson on the 'phone. "I was just thinking of you and wondering why you had not been around; am just about ready to buy that car," said Dickinson.

"If that's the case, I will come right down and see you," announced the salesman.

Just one hour later he had the signed order and a substantial deposit. And that same afternoon, in spite of the rain, this salesman sold two other cars. "It never rains but it pours," he remarked to himself as he slipped the orders under the roller top of the manager's desk that evening.

Method Essential in Working Field.

How do you know that you are working your territory properly? What method have you for finding out? How many cars have you sold in proportion to the population? Is it one in one thousand, or in every five hundred, or what? What percentage of increase do you show over the business of last year? Get down to figures—and be sure your figures are right.

AWAKE-NDISING WORLD

SALES-MAKING EARNESTNESS

Enthusiasm Begets Earnestness and Latter Means Sales—How a Man Who Radiated His Belief in His Goods Made 500% Gain.

Are you really in earnest?

The answer to that question is of tremendous moment to a salesman. If he is not sincerely and enthusiastically in earnest about his business he might just as well quit.

There is a magic fire to earnestness that kindles warmth in the buyer. It makes him stop and listen. He says to himself, "Here is a man with a message; I must hear it." He gives close attention; he believes, because the earnestness of the salesman convinces him, in spite of himself.

Went Out to See the Field Himself.

Being in earnest, a man may make two sales where he made one before. He simply cannot let things go in an ordinary sort of way. His enthusiasm is too keen, the opportunity for those he is selling is too large; he must tell them about it.

A fountain pen manufacturer, who is nothing if not in earnest, decided to take to the road himself and face just what his salesmen were facing. A certain territory happened to be vacant; he went in and worked with all the earnestness at his command. His selling style was crude, according to the "dope," but he was terribly in earnest. He got attention always. And he got orders. In one Western city of importance he opened up 150 **new** accounts in a season. The best record before was 25.

Asked why he was so successful, he replied: "I don't know, unless it is I am thoroughly in earnest—and I always get attention." Watch him make a sale and you realize what a force that earnestness is. He makes you fairly jump with his earnest enthusiasm. And it isn't merely the words, but the words and the manner and the action of his arms, legs and head. They all work—and work for the order.

LETTING THE PUBLIC LIGHT THE SALESROOM AFTER DARK

It is not necessary to find a connection between candy and automobiles—even if some cars are "the candy"—to enable the automobile or accessory dealer to make application of an advertising scheme which has proved an attraction in the store of a confectioner in Minnesota; it is a part of store advertising which will fit more than one trade.

The confectioner hooked his store lights up with a button switch which he located outside the store door beneath the sign, "Push This Button and See Our Store." He generally closed up about 6 o'clock, and it was during the evening hours that the scheme got in its good work. Passersby who saw the sign pushed the button, of course, and immediately the interior of the store was brilliantly illuminated. When the button was released the lights went out. The scheme proved so great an attraction that those who had tried it brought their friends to see it.

How the Device Might be Applied.

In an automobile salesroom, for instance—should the dealer care to leave his displayed cars in darkness except when lighted by the button—the display could be made striking and effective. If the cars were arranged to advantage with price signs in plain view where the whole would best strike the eye of the man at the button, it is not improbable that the exhibit would be noticed by fully as many people as the salesroom in which the lights burned steadily the whole evening. The sign above the button would be many times more serviceable were it a transparency backed up by a small light.

To go still more deeply into the scheme in its application, especially to an accessory store, several buttons might be arranged along the bottom of the window, each button connected with a ground glass sign or transparency of some sort which would carry a message to the man who pushed the button. If ground glass were used with the advertising painted or chalked on the back the copy could be changed daily with little effort or expense.

WHY IT IS WISE TO ITEMIZE LABOR DONE IN REPAIR WORK

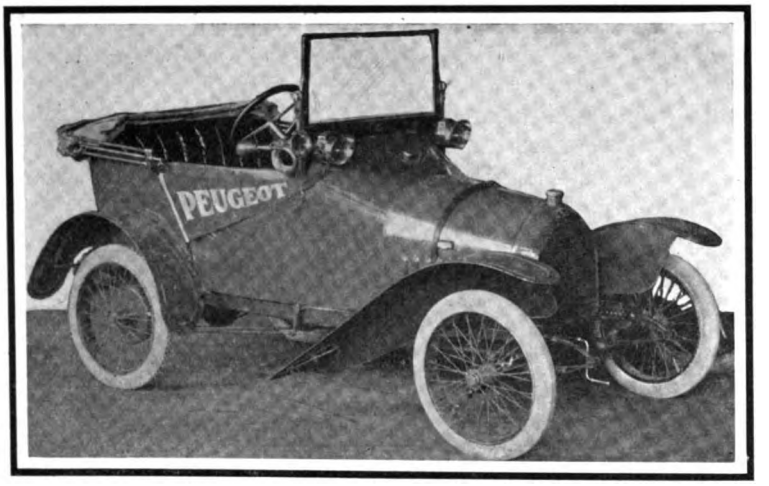
In making a repair bill be sure to itemize the work done. It may save a lot of argument and some expense in the future.

Following a custom that obtains widely, one garageman billed a customer for various bits of work done under the item "30 hours labor, $18," and entered the item on his books in the same way. Two months later the customer came back and demanded that the work of taking up the main bearings and putting in new wrist pins be done over again without charge.

He claimed that this was the work for which he had paid 60 days before. The repairman did not remember the details of the work then done, and his books did not give any clue. While morally certain that he had never done this work, nevertheless he felt compelled to take the customer's word for it as he had nothing to show what he had done.

His style of bookkeeping underwent an immediate change. Time cards and books alike now show exactly what is done and what it costs.

Success in the Adoption of Ideas.



Some men turn down good suggestions simply because they did not think of them first; others are quick to grasp any suggestion that looks like better business and try it out. It is not hard to predict which will make the greatest success.

"BABY" PEUGEOT CYCLECAR IS BIG CAR IN MINIATURE

Unusual Transmission Has Two Shafts and Two Speeds, Both on Direct Drive—High-Speed 4-Cylinder Motor Employed.

The development of the cyclecar in that part of the world usually known by the much-embracing term "abroad" has preceded and exceeded its development in the United States very considerably; and for this, if for no other reason, the foreign type of cyclecar is of no little interest to those who see a great future for the narrow-gauge midgets. And of the various types of diminutive machines none, perhaps, is more interesting than the "Baby" Peugeot. Essentially a big car on a small scale, the little French machine has done much in emulation of the successes of its big brothers; on the Le Mans Circuit, for instance, Baby Peugeots, in competition with other cyclecars, took second, fourth and fifth places, the best speed being an average of 46 miles an hour for the total distance of 168 miles, and first and second places were taken in the Mt. Ventouz hill climb. The machine is imported by the Peugeot Auto Import Co. of New York.

SIDE VIEW OF "BEBE" PEUGEOT WHICH HAS TWO DIRECT DRIVES

The general appearance of the car is so well shown in the accompanying illustration that comment hardly is necessary. It may be said, however, that there is more room for two passengers than appearances indicate, the deep cowl enclosing a surprising extent of leg-room. Being a real car in miniature, the "Baby" is shaft driven; it is peculiar, however, in that it has two shafts, enclosed in a single torque tube, each driving through its own set of bevel gears on the full-floating rear axle. Thus the machine has two forward speeds and each is a direct drive; control of the speeds is effected by a Bowden wire connection with a lever on the right side of the body, inside; the effect is to connect the desired drive shaft with the clutch shaft. The clutch is an inverted cone with a leather facing.

The little four-cylinder motor is rated at 6-10 horsepower, and its bore and stroke of 55 x 90 mm.—approximately 2 5/32 x 3 17/32 inches—indicate that it must turn up a lot of revolutions in a minute to develop that horsepower. In other words, it is a high-speed engine. The cylinders are cast in a single block and are of the T-head type; all the valve lifters, stems and springs are enclosed in approved fashion. A Bosch high-tension magneto is run from the same shaft that drives the water pump. Lubrication is by drip feed from a tank placed in the cowl, and an interconnection between magneto and oil controls shuts off the oil when the motor is stopped so that there will be no drip when it is not needed. The carburetter is a Zenith.

Regular car practice is followed in the construction of the chassis frame, which is of channel section pressed steel, narrowed in front. The front springs are semi-elliptics, while in the rear the springs are inverted quarter-elliptic, the ends of the springs beings being clipped to the axle casing. Internal expanding brakes in drums on the rear wheels are operated by both hand lever and pedal. The wire wheels, which are not detachable, are fitted with tires 550 x 65 mm., or approximately 21½ x 2½ inches. The equipment included in the price—which is $975—comprises top, windshield, shock absorbers, acetylene lamps and generator, horn and tools.

TIRE MAN SUGGESTS THAT LETTERS BE STANDARDIZED

Says Business Correspondence Could Be Made More Efficient—Delays Which Might Be Avoided by His Plan.

Regardless of what Noah Webster has to say about it, the word "Standardization," so far as the automobile trade is concerned, has been made to mean "being brought to the standard of greatest efficiency or value," so that when C. R. Johnson, of the Efficiency and Welfare Department of the Goodyear Tire & Rubber Co., talks of "standardizing business letters," it is not difficult to surmise what he means. Johnson suggests one principal change in the belief that it would increase the efficiency of the letter and lessen the work.

"The suggestion has come to the writer," he said, "that the National Association of Manufacturers might be able to assist materially in standardizing letter writing methods in business correspondence throughout the country. We find, by our experience, that many letters come addressed to this company with no notation which will assist our mailing department in locating the party for whom intended. The result is the mail becomes delayed to a great extent, and very often it is located at its proper place only after consultation with our files. It has been suggested that an appeal might be made to manufacturers to standardize the method of addressing correspondence as follows:

"The envelope to have firm address only. The salutation to consist of firm address as displayed on envelope, plus the 'Attention of' a certain party or department.

"The temporary absence of an individual representative of a firm, to whom a letter has been addressed, often causes a vexatious delay in attending to the correspondence, whereas every good business organization is equipped to give prompt attention to all communications if they be not held up by the appearance of being personal letters which must await the return of the particular persons to whom they are directed. So great a nuisance has this become that many firms feel obliged to print on their letterheads the instruction: 'Address all communications to the company, and not to individuals.'"

Tie-Rod that Should be Kept Secure.

In a car having a tie-rod extending from the radiator to the dashboard, care should be taken that the rod is fast at both ends; otherwise there may be trouble less easily remedied than the looseness of the rod.

WHY IT'S FOOLISH TO BITE A GOOD CUSTOMER

He Doesn't Enjoy It and It Doesn't Help Make Sales, Says Reilly, Who Is Attacked by an "Ear-Chewing" Insurance Man—Unable to Understand the Methods of Some Men Who Persist in Appearing "Intense"

"Insurance. I can tell by the looks of him," guessed the Sales Manager, who walked across the salesroom floor and into Reilly's office at the same time that a hawk-like and cadaverous looking individual hurried out.

"Insurance is right," replied Reilly. "That insurance agent just set me wondering again, and I'm glad you're so reassuring; although I don't know whether you're on the level or not."

"I suppose this is only your way of getting around to tell me what ails him."

The Sales Manager threw his fall over-

"HE CRAWLS RIGHT UP INTO MY FACE WHEN HE TALKS TO ME"

Both men turned to watch the furtive little man whose actions, combined with a walk that seemed to be made up of a succession of darts and spurts, indicated that somewhere back in some misty age when the Big Ones used to eat up the Little Ones one of his ancestors might have been a water bug. As a succession of unusually jerky jerks jerked him around a corner and out of sight Reilly turned to the Sales Manager.

"Jim," he asked, "do I look funny?"

"No more than usual."

"Or beautiful?"

"Not very."

"Do I seem hard of hearing?"

"What the——!"

"Does that guy look like a 'dip'?"

Sales Manager Demands Explanation.

"More or less, but what's the idea? What's happened now? What did he do to you?" shot back the Sales Manager like a rapid-fire gun before Reilly could get in another of his strange questions.

"I know I'm getting along in years—I'm thirty-eight now, in ten years more I'll be forty-eight and in ten years more I'll be an old man—and every now and then I am caused to wonder whether I'm getting so I look funny or can't hear," replied Reilly. "That insurance agent just set me wondering again, and I'm glad you're so reassuring; although I don't know whether you're on the level or not."

"I suppose this is only your way of getting around to tell me what ails him."

The Sales Manager threw his fall overcoat over the back of a chair and sat down beside Reilly's desk.

"He's an ear-chewer," said Reilly.

"A near-what?"

"An ear-chewer. You know; one of these gents who chews your ear and nearly kisses you."

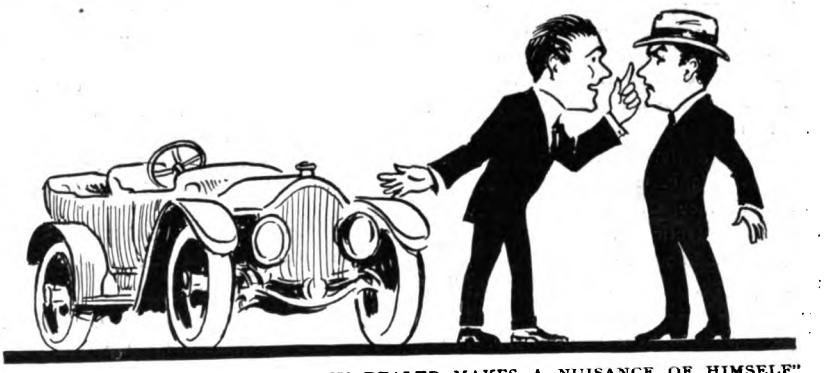
"No; I don't know," asserted the Sales Manager. "Furthermore, I don't believe I care to know."

"I don't say I care to myself, but what can you do? I shooed him out as quickly as I could. I can't stand that kind."

"What's the matter with him?"

"The same thing that ails all the rest of them, I suppose," explained Reilly. "They think it's the way to be a convincing salesman. I never could see anything in it myself; it is so distasteful to me that I absolutely couldn't try it on anyone else."

"He——"



"He crawls right up into my face to talk to me and if his tongue gets twisted he gives an imitation of the atmosphere about the Maid of the Mist and——"

"You mean he's one of these short-arm salesmen, a kind of in-fighter," suggested the Sales Manager.

"The same thing," rejoined Reilly. "There are a few in all trades, I suppose; we have them in this trade. There's an accessory man who comes through here now and then whom I always try to dodge. They'll never succeed in selling me anything as long as he handles their line of stuff.

Accessory Salesman Who Is Unwelcome.

"Every time he comes in and succeeds in catching me here he pulls his chair right up close to me and begins to talk. He gets his face so close to mine that I can tell every last thing he had for breakfast and whether he forgot to clean his teeth that morning. Knowing the rate his whiskers grow, I can tell to a minute how long it is since he had his last shave, and I can even tell whether he's been smoking Sweet Caps or Royal Bengals."

"WHEN HE GETS A PROSPECT THIS DEALER MAKES A NUISANCE OF HIMSELF"

"You're becoming very proficient; a regular Sherlocko."

"More so than I care to be," snapped Reilly.

The telephone rang. As Reilly hung up

Digitized by Google

he said, "There's another one. I wish they'd all use the telephone. A solicitor for newspaper used car advertising. Every time he comes in he makes me feel in peril for the end of my nose. He's a snappy talker and he gets so darned close I'm afraid of him."

"What good does it do?"

Over-Emphasis and Finger Shaking.

"What good? No good," replied Reilly. "There's a dealer here in town who has that same habit. When he gets a prospect on the salesroom floor this dealer makes a regular nuisance of himself, although he doesn't know it. He sticks himself right up close to the prospect and persists in hammering on every word as if emphasis made it impossible for the prospect to doubt the story. He uses so much emphasis that none of it amounts to anything. It's up with whatever treatment they get from a salesman; but there are prospects who are mighty particular and some of them are very fussy about the kind of salesmen they deal with.

"One day a man whom I had known fairly well for a long time walked in and said, 'Reilly, if you'll promise not to spit in my face or try to kiss me or bite my ear, maybe I'll buy a car of you.' I told him I would endeavor to respect his wishes, and before he left he told me he had been over to see my finger-shaking competitor. He said he went in and tried to find out something about the car and that the first thing he knew he thought he had stirred up some kind of a bees' nest, for the dealer got right up into the prospect's face and began his finger-shaking story.

"Finally the dealer wanted the prospect to go for a ride; the prospect didn't ob-

"I FIXED HIM. I PUSHED BACK. HE WAS SO FAR AWAY HE COULDN'T TALK"

like wearing a red necktie. If you wore a red tie someone would notice it, but if you wore a red tie and a red shirt and red clothes and red shoes and a red hat no one would so much as notice your tie.

"He likes to shake his finger, too. He crawls right up in the prospect's front yard, figuratively, and every time he brings out a sales point shakes his finger in the prospect's face. His theory is, I suppose, that those tactics are convincing. Some people, you know, seem to believe that if they get right up close to a man, talk strong and shake their finger at him they are bound to make an impression. Mostly amateurs do that, but now and then you will find an old-timer who hasn't been able to get over it. They evidently think it shows intensity of purpose, or earnestness or something like that."

"Does he sell any cars?"

"Yes," drawled Reilly, as he pulled out the bottom drawer of his desk for a foot rest, "he is a pretty good salesman even if he has that one bad habit. I don't know whether it loses him many sales, for many people seem to think they have to put ject particularly to this and, anyway, he thought it would so arrange things that the dealer couldn't get so close in his conversation. But the prospect was disappointed. As soon as they got out on the road the dealer persisted in leaning over and managed to stick just as close as he did in the salesroom. Finally, the prospect made an excuse and got away. He came over here then."

How the Sales Manager "Fixed" One.

"One of those salesmen came in to see me the other day," broke in the Sales Manager. "He had been in before and I made up my mind he was going to have trouble the next time he came. I fixed my desk and the chairs so he would have to take a chair on the opposite side of my flat-topped desk. He fell into the trap finely. As soon as he got in motion he leaned over the desk as far as he could—and then I fixed him."

"How?"

"Why, I just pushed back a little and leaned back in my chair, and it left Mr. Shortarm Infighter so far away he didn't know what to do. He was so far away he actually couldn't talk. I could see it bothered him. He was used to getting right up in a man's face and talking from that position, and when he found himself several feet away he got badly flustered. He floundered.

"But I honestly believe he didn't know why he couldn't talk so well," smiled the Sales Manager. "He looked puzzled as he went out the door; he seemed to be wondering away back in his brain as to why he had felt handicapped. But the sonofagun! I knew what ailed him. I'd like to tell him, too."

Finger Shaking an Attempt to Bully.

"I have often thought I would like to uncover the working of the mind of one of those salesmen and see just what he thought of himself and his methods of selling." Reilly delved into a drawer and unearthed a Missouri meerschaum which was but little colored. "They either don't stop to analyze themselves and their methods or they have a badly distorted vision in regard to salesmanship. This getting up into a man's face and shaking your finger at him is nothing more or less than an attempt to bully the man."

"Bully him!"

"Yes, bully him! There's no reason in the world why a salesman can't make his conversation just as effective from a distance of three or four feet as from a distance of a foot or six inches. I may not be exact as to distance, but my intentions are good. The man of any intelligence—and most men who buy cars have some intelligence—can comprehend a salesman's story just as well if he isn't too close. It also makes a much better impression, for the prospect is likely to acquire an unfavorable prejudice if he gets an idea that the salesman is trying to jam through a sale.

Reilly Angered by His Remembrances.

"Why, hang it, Jim! It isn't even gentlemanly! It's positively rude! It's disgusting! The more I think of that insurance salesman who just went out the madder I get. I could shoot an insurance man on sight, anyway, and when one tramples all over my face I'm sore."

Reilly had by this time rammed a load into his new corncob and he said "sore" to the crack of a match on the bottom of his chair. The Sales Manager watched with interest while Reilly puffed raucously and blew out the match.

Just then an air current wafted the pseudo-fragrance toward him.

"I would suggest, Reilly, that you light that stove the next time he comes. If he can stand that he's entitled to some business."

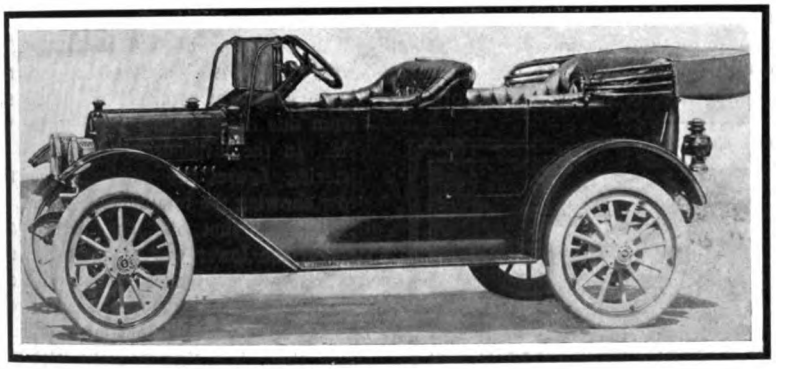
MORE CAR FOR LESS MONEY IN LATEST EMPIRE MODEL

Fifty Dollars Off Price Despite Enlargement of Car and Addition of Equipment—Chassis Practically Unaltered.

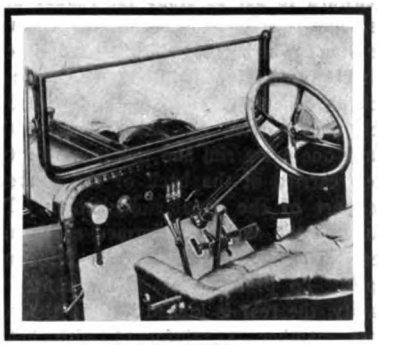
Like so many other manufacturers who have found extensive alterations unnecessary to bring existing models up to the plane that will entitle them to the designation new series, the Empire Automobile Co., of Indianapolis, Ind., has contented itself with making only minor changes, the most important of which is a lengthening of the wheelbase to 110 inches, and with adding considerable equipment to its latest model, which bears the distinguishing number 31. The price of the single model that will be produced, however, has been lowered by $50, the touring model now listing at $900 "all on," as the British say.

In point of fact, the car on the whole is a considerably larger car than it has been in the past, despite its lowered price; and the length of the chassis is not the only place where the enlargement is visible. The body has been made roomier, which means that the seats have been widened, and doors, too, now are larger and are of the full U-shape that appears to be gaining in popularity. Quite as a matter of course, door hinges and latches have been concealed and the smooth exterior of the body is accentuated by the clear running boards and the redesigned fenders which hug the wheels a little more closely than in previous models. As in the past, the steering wheel remains at the right side, though the control levers now are in the center and are placed so close to the driver's seat that they offer no hindrance whatsoever to easy entrance and exit from either side. The gear shift lever, for instance, is of the cane handle type and its total movement has been reduced to the minimum.



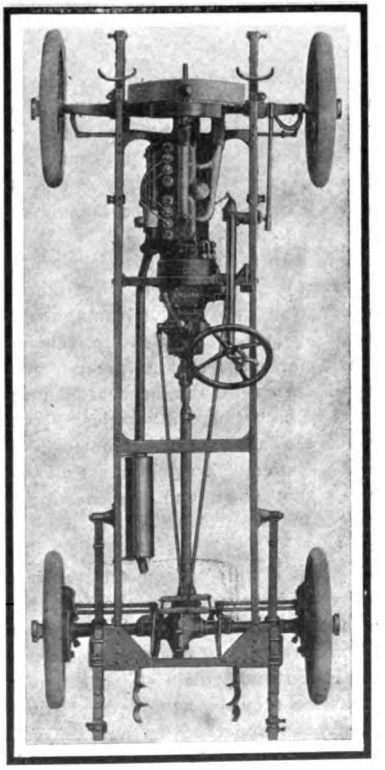
In the power plant and its allied parts, meaning the transmission elements in general, little room for improvement has been found. The motor itself remains of the L-head type with its cylinders cast in two blocks and supported at three points on the chassis frame. As heretofore, the bore and stroke are 3¾ and 4½ inches, respectively, giving a piston displacement of 198.8 cubic inches and a nominal rating of 22.5 horsepower. Needless to add, cooling is by water and ignition by high tension magneto.

In the ignition system, the makers have given at least one indication of their attempt at simplification and the reduction of working parts to the minimum. The magneto, which is an Eisemann, has no advance lever; the spark is set and the only wiring in the system consists of the wires leading to the dash switch and the four wires leading directly to the plugs. Lubrication is by the well-known pump-over constant level system in which the oil is forced through a sight feed on the dash and thence to troughs beneath the connecting rods; the oil capacity is 1.5 gallons.



Further delving into the construction of the motor brings to light that the camshaft is formed of high carbon steel with the cams made integral; riding on them the push rods have fiber inserts to eliminate noise of the valve action, and the springs, etc., are enclosed by means of removable covers. Giving indication of the liberality of the makers, the crankshaft measures 1¾ inches in diameter and is carried in three bearings, of which two measure three inches in length and the third four inches. White brass is utilized as bearing material throughout the construction.

By way of providing smooth and sure action, the clutch has been made to operate in an oil bath, which makes plain, of course, that it is of the multiple disk type; it consists of three 9-inch disks, two of which are faced with Raybestos; the third is polished steel. The whole clutch mechanism is rendered accessible through a large hand hole placed directly beneath the floorboards in the driver's compartment. The gearset, too, is easily accessible for inspection, for, being a unit with the motor and the clutch, it is disclosed by the removal of the footboards. The gears have faces seven-eighths of an inch in width and provide the usual three forward speeds and reverse; control is selective.



Behind the gearset, a single universal joint is interposed ahead of the rear axle, the drive shaft being enclosed in a substantial steel tube which absorbs torque reactions. The tube is well reinforced at the differential end and liberal provision for adjustment is made. The propeller shaft itself is squared where it enters the differential, construction which facilitates the

NEWEST EMPIRE FIVE-PASSENGER MODEL WHICH LISTS AT $900

CONTROL UNITS IN DETAIL

CHASSIS SHOWING SIMPLICITY

Digitized by Google

removal of the mechanism without disturbing other parts. As a matter of fact, by detaching the spring clips and brake rods, the rear axle can be removed bodily. The drive axles are of the semi-floating type and the whole system bears the Weston-Mott nameplate.

At the front, the chassis is supported on the usual semi-elliptic spring members and in the rear three-quarter scroll elliptics are used. One interesting feature of the spring construction is that each of the leaves is carefully ground before assembly, thus ensuring easy action and the maximum of resiliency. In the rear springs, the lower leaves of the upper member are extended backward to act as stops for rubber buffers, thus relieving the springs of much of the abuse which results from hard shocks. Wheels, both front and rear, measure 32 inches in diameter and are shod with 3½-inch tires carried on Baker demountable rims; one extra rim and tire irons for two tires, carried at the back of the tonneau, are part of the regular equipment. The frame of the chassis is formed of channel steel .1562 inch thick with a 3.562-inch depth. To provide for a low center of gravity, the rear is kicked up and the rear cross member is reinforced with heavy steel gusset plates securely hot-riveted in place.

In the braking system, the service brakes are of the familiar external contracting type operating on 12-inch drums having a 2-inch face. The emergency brakes are of the internal expanding type and both sets are carefully equalized.

Regarding equipment, the list that goes with the car and is included in the price is quite complete. In addition to the mohair top with its dust envelope, there are side curtains, of course, and they operate from the inside of the car; there is a rain-vision windshield that is securely built into place; Stewart speedometer; Prest-O-Lite acetylene tank with the usual complement of oil side and tail lamps and acetylene headlamps; Baker demountable rims with one extra; tire irons; robe and foot rails; horn, jack and tools.

Car Specifications Extraordinary.

If the ambulance described by a British reporter comes up to the alleged specifications, it must be a truly wonderful vehicle, for it was said in cold type that the machine had a "20-horsepower chassis; four-cylinder tension square tube; honeycomb cylinder with fan; high tension magneto and coil accumulator; four forward speeds and reverse; elliptic rear wheels and semi-elliptic front springs, the suspension of the car being all that can be desired; change speed control; wheelbase dimension 10 feet; width over all 13 feet 3 inches."

MEASURING "COASTABILITY" OF ELECTRIC COMMERCIALS

Percentage of Miles Coasted to Miles Run Under Power Indicated by New Instrument of Simple Construction—Its Advantages.

How far will an electric vehicle coast?

To any one who has ever ridden in an electric pleasure car the almost uncanny ability of this type of vehicle to skim along for considerable distances after the power has been shut off probably remains as an easily remembered impression. That they will coast for long distances is fairly well known and their ability to do so can be put down directly to the efforts of their designers to reduce friction to the minimum, for the greater the distance that is coasted, the greater will be the mileage of the battery on a single charge; and greater mileage is what every one is striving for, with the logical accompaniment of economy of electricity.

R & L ELECTRIC COASTOMETER

But though they will coast for surprising distances, the fact remains that there are few operators who take advantage of this desirable feature. In pleasure vehicles it is not as essential that as great a part of the mileage as possible be coasted mileage as it is with commercial vehicles, of course, for with the latter, maintenance cost, which includes battery charging, must of necessity be kept down and the coasting percentage of the vehicle is an important item.

That this is fully recognized even in railroad work is revealed by the fact that in the tubes which lead from New York City to New Jersey the trains are fitted with devices which make plain the exact amount of coasting they do, as compared with the distance run under power, and the motormen are encouraged to coast as much as possible without disregarding their running schedules, by the offer of bonuses for their ability to exceed a predetermined coasting standard. Naturally the motormen have become adepts at coasting.

Applying the same principle to the operation of electric commercial vehicles, the Rich & Lindeman Mfg. Co., of 258 Broadway, New York City, has brought out a device which is styled a Coastometer, and which is designed to give an accurate record of both the mileage run under power and the mileage coasted. The device itself is shown by the accompanying illustration, which shows that it differs but little in either appearance or size from the standard and well known odometer used on automobiles.

As a matter of fact, the basis of the whole device is a simple odometer operated in the usual way by means of a flexible shaft from one of the front wheels of the vehicle. In the instrument, two rows of registering figures are employed, the upper row showing the total mileage covered with the power shut off. The mechanism by which the lower row of figures is caused to operate or remain stationary, according to whether the power is on or off, is beautifully simple. Contained within the case there is a tiny magnetic latch which is connected in parallel with the controller. When the power is on the magnetic latch locks the lower row of figures; when the power is shut off, the latch releases the lower figures, which then record the distance that is traveled with the current shut off.

So the instrument can be adapted to a number of different vehicles carrying different sized batteries, a small resistance and fuse unit forms part of the euqipment and it can be placed in any convenient place on the chassis. The device can be securely sealed so that it cannot possibly be tampered with.

As a concrete example of the operation of the device, it is pointed out by the makers that a 3½-ton electric truck with a constant load was driven over a predetermined course in New York City, no special attention being paid to coasting, the Coastometer showing a ratio of 20 per cent. coasting at the end of the trip. The same truck with the same load then was driven over the identical route and caused to coast at every opportunity. The Coastometer showed that the ratio of coasting had been increased to 30 per cent. At the same time, readings taken with an integrating watt meter showed that a saving of 11.1 per cent. had been made in the second trip over the first trip, and this by increasing the coasting only 10 per cent. There was practically no difference in the time of the two runs, indicating that the coasting did not entail offsetting delays.

BREAKING DOWN THE FALSE BARRIER OF "CLASS"

Dealer Who Makes a Business of Inducing Owners of $5,000 Cars to Buy a $1,000 Car—Argues That Little Car Is Necessary and an Economical Adjunct—A Few Sales Ideas That Are "Different".

"What's the use of seeing him? He's got a Packard. Or Booth? He's going to buy a Peerless."

"Is that any reason why he shouldn't have a Hup?"

"But it sounds foolish to me."

"Maybe it is, but we've made such sales before and probably will make a lot more, so don't get scared just because your prospect owns a car that cost $4,000 or $5,000."

Fear of "Class" Wrong Assumption.

This mythical conversation might have occurred in the salesrooms of the Service Motor Car Co., of 373-375 Central avenue, Newark, N. J., had a new or sceptical salesman endeavored to show Manager F. C. Stowers the apparent folly of trying to sell a low-priced car like the Hupmobile to a man who is in the high-priced class; anyway, it exemplifies the company's attitude in selling Hupmobiles and demonstrates that the salesman who gets "buck fever" or "cold feet" because his prospect seems of too high a class is away wrong in his assumption.

Stowers conducts his selling business on the basis that the man who has bought a big, high-priced car not only might buy a low-priced, low-powered car but actually needs one; all that remains to be done is to convince the owner of the palatial vehicle of his need.

This invasion of the aristocratic circles of motordom in search of purchasers for Hupmobiles may seem strange to more than one dealer or salesman, but, backed up in his belief by past results, Stowers diligently continues to compile lists of owners of high-priced cars and to circularize them with letters calling their attention to their need for a little car as well.

"The man who has a big, costly car," said Stowers, "needs a little car nearly as much as the man who hasn't any car at all. The incentive for both to buy is the same; it is economy. The man whose first and only car is a low-priced vehicle chooses it because it is a less expensive purchase and operating proposition than the big car, and the man who already has a big car requires a little vehicle to enable him to cut down his upkeep expense. Economy appeals to almost any man.

"The man who has a big car must pay more to operate it than does the man who owns a little car; the big car generally has a bigger motor with more horsepower and the car is heavier. It is a car which harmonizes with the man's social position, but it costs money to run it. That is all very well; the man can afford it, but even if he can afford it, there is no reason why he shouldn't effect an economy if possible.

Recommends Little Car for Errands.

"Possibly much of the service of the car is rendered to the man's wife in trips around town and in shopping; maybe the motor is left running for minutes at a time while the car stands at the curb, although that isn't necessary in the day of electric starters, except when the weather makes this necessary. It doesn't require much argument to convince any man that it costs less to run a Hupmobile than it does to run some of the bigger cars and that it is a very desirable vehicle to use in short runs around town. Of course, when the owner and his wife, or either one of them, want to take what they might call a 'regular ride' they probably can see nothing but the 'classy' car, but for errands around town and such trips the little car fills a need which actually exists. The little car could do the big car's work on all occasions, but we wouldn't recommend that to the owner of the costly car for it might result in no sale at all.

"Our argument to him is that the little car takes the place of one horse and a light wagon in the old horse-drawn vehicle days and is ideal for that work. We have proved that our sales theory is correct, for we have made quite a few sales to men who were willing to supplement their large cars with little ones."

How Ownership of Small Cars Results.

It might also be added that, instead of the man of money looking with disdain on the low-priced, little car his attitude can be made quite the opposite. Should he own a Hupmobile only, his friends might smile at him, but when he is known to own one of the best cars there is and to use the little car for short trips, the matter assumes an entirely different aspect. The man who can buy anything his heart desires and who owns a low-priced article is not regarded as is the man who pays a low price because his means command it.

Wherefore, having compiled a list of owners of Packard, Pierce-Arrow, Locomobile, Peerless and such cars, the Service Motor Car Co. directs to these men this initial letter:

"If we can save you money and make money by doing so, we are both satisfied with ourselves and each other.

"Here is how we do it: We sell you a Hupmobile, either runabout, touring car, or coupe. This little car travels 20 miles on a gallon of gasolene, and from 800 to 1,000 miles on a gallon of cylinder oil. This saves you money. The car is a mechanical masterpiece. There is, therefore, no comeback on us for expensive repairs (for we stand back of the cars we sell). That is

Digitized by Google

where we both make money. You save unnecessary annoyance and delay through the loss of the use of your car, we save the expense of the repair.

"We are mailing you under separate cover advance catalog. There is a Hupmobile that fits every requirement. Pick out the one that meets yours, and we will gladly prove our assertion to you without cost or obligation on your part."

Maybe the first letter doesn't bring a response, in which case the dealer follows it up a week later with this one:

"We have been called upon repeatedly to prove the assertions made in our recent letter, and in each instance it has resulted in a sale.

Little Car Like a Little Diamond.

"Is this not logical? In the first place we would not made to make an assertion we could not prove. Secondly, there are many points of superiority and things this car can do that we did not mention.

"The Hupmobile is indeed a remarkable car. It compares with more expensive cars as a small diamond to the large one—'just as good but not so much of it.' This is proven by the splendid work it has done in all parts of the world, and the universal satisfaction it has given to owners.

"Join the Hupmobile Family, and get the utmost that money can buy in motor car service and satisfaction."

And if this one doesn't do the work others along the same line are written and the company employs other sales work. Before leaving the prospect, however, the company desires to make sure that the point it wishes to convey is thoroughly understood by the object of its sales attack. Many of these attempts yield results in a field which would not even be considered by some dealers; the automobile salesman, in some instances, is too prone to regard the ownership of a high-priced car as a stone wall barrier to the vendor of small cars.

Prospects Come from Many Sources.

It should not be understood, however, that this circularization of the high-priced car owners is the feature of the Service company's sales work, for it is only a part; in fact, it may be said to be a small part. Prospects are secured from Hupmobile owners who are satisfied with their cars and their treatment, from advertising and from the many other sources employed by the average dealer. The invasion of the high-priced field is but a result of the company's aggressiveness and belief that many so-called impossible things are capable of accomplishment.

Also, this policy assumes a lesser station in the company's sales program when it is understood that this dealer combines the sale of Hupmobiles and Abbott-Detroits, and back of this amalgamation is the very definite policy that two lines are better than one, are better than three or four and, in fact, are the best business arrangement for a dealer. Concentration on one line is conscientiously advocated by some dealers, but Stowers said he is firmly convinced that two lines are better.

Variety Which Two Lines Affords.

Handling two lines affording a wide range of price and size of car, he said, made it possible to offer a choice to nearly any prospect whom the company might secure. The Hupmobile ranges from $1,050 to $1,350 and the Abbott-Detroit line picks up the price scale at $1,785 and ranges upward to $3,500. If a man wants a comparatively low-priced car the Hupmobile offers a model; does he desire something larger, roomier and more costly, he may select from the Abbott line.

"I think this the ideal arrangement," said Stowers. "Concentration on one line is all right, but it confines your activity to one class of prospects, whereas with two lines, each one containing several models, a dealer is in a position to offer something to nearly every prospect. With the Hupmobile and Abbott lines we have a variety of price and size of car.

Competing Lines Should Be Avoided.

"By two lines I do not mean competing lines. That is the worst arrangement a dealer can make. I know from experience. We started in business here about 15 months ago and at that time had in our salesroom two lines of cars which were much alike in size and price. It actually was a handicap. A prospect would look the cars over and then, there being but little difference in the prices of the size of car he had in mind, would ask which was the better car. It left the salesman in an embarrassing position. If he said the one was better the prospect very likely would think the salesman had some reason for saying so, and if he said the other was the better the same condition prevailed.

Letting Buyer Choose Muddles Him.

"If the salesman said—as he generally had to say—that 'One's as good as the other. Take your choice,' it left the prospect in a more or less muddled state of mind, which was not conducive to his concentration on any one car. As it is now, we can tell him that both cars are good cars and will give good service but that the one which costs the more naturally is the better. But we do not state that the lower-priced car will not run as well or as long as the higher-priced one.

"A dealer, also, should be sure he gets a car he can stand back of. Last year one of the lines we handled was very badly designed and cost us a lot for service. We had to stand back of it, however, to save ourselves, but we are not handling it this year."

The Service Motor Car Co. is Hupmobile distributer for the greater portion of New Jersey and is prosecuting a campaign for subdealers. The same argument that is advanced to the owner of a big car holds good with the dealer in a big car; the little one fits in and cares for business that would otherwise go by the board. The company, which has a branch in Plainfield, where it maintains what it states is the largest garage in New Jersey—three stories, 100 x 100 feet—occupies in Newark a new and up-to-date building.

Space Economy Keeps Overhead Down.

Overhead is kept down by sacrificing storage space and the limiting of what space is used to the actual needs of the business; but despite this, the quarters are not crowded. A model stockroom for Hupmobile parts has been installed on the second floor. Every part is numbered by the factory in its parts catalog and the bins in the stockroom are numbered consecutively to correspond. When a part is wanted, all that is necessary is to go to the bin of proper number. The parts catalog is the stockroom index book as well. In the repair-shop a small but sufficient machine equipment is being added. It is not pretentious and could not be classed as a full-fledged machine-shop, but it will care for all ordinary work.

Stowers, who is one of the stockholders in the company, has been engaged in the trade for some time; before locating in Newark he was an eastern territorial representative of the Reo Motor Car Co., from which vocation he gained knowledge of dealers' work, methods and problems which is proving valuable in his own venture as a retailer of cars.

Substantial Soldered Joints.

One of the most satisfactory methods of soldering together parts that offer a considerable contact surface is to "sweat" them. The surfaces to be joined are "tinned," which means that they are given a coating of solder applied to well-cleaned surfaces, with the proper flux, while the pieces are hot enough to melt the solder; while still hot they are held tightly together until the solder solidifies. If more convenient, the pieces may be allowed to cool after tinning, being reheated subsequently for joining. Obviously, the necessity for perfect cleanliness exists in no less a degree for "sweating" than for soldering.

CAR OWNER NOT LIABLE FOR "JOY-RIDING" OF CHAUFFEUR

Unless Driver is on Employer's Business Latter Cannot be Held for Accident—New York Court Holds Chauffeur Should be Sued.

The burden of responsibility attaching to the owner of a car which meets with an accident while being used by the chauffeur not within the scope of his employment, even though with the owner's permission, was removed last week by a decision rendered in the Supreme Court for New York county by Judge Cohalan. His ruling in substance was that unless the chauffeur was engaged in his employer's business at the time of the accident the employer was not liable for damages.

The status of the car owner has been a varied one in different localities and one State even had in hand a measure which would make the owner at all times liable for the damage done by his car even though anyone broke open his garage and stole it for joy-riding purposes; it has been held on some occasions, however, that when the car owner granted permission for the use of the vehicle and had knowledge of this use he was liable.

To cover other conditions, such as the taking of the car without the owner's permission, New York State, at least, has now in effect a law which makes it grand larceny for a chauffeur to take a car out upon the road without the permission of the owner. But in Davies vs. Anglo-American Auto Tire Co., the suit before Judge Cohalan, the complainant, Davies, was injured by the car while it was being used on a pleasure trip by the chauffeur with a party of friends. He had secured his employer's permission to take the car and therefore the chauffeur and not the employer was held to be the one from whom damages should have been claimed.

The issue was made a clean-cut one by Judge Cohalan, who said: "The question, so far as the defendant Anglo-American Auto Tire Co. is concerned, is whether the chauffeur at the time of the accident was acting within the scope of his employment. The question of the ignorance or consent of the master has no bearing upon his liability. The jury has found a general verdict for both defendants, and in addition has found specially (1) that the accident was caused by the negligence of the chauffeur, and (2) that the automobile was being used by the chauffeur and his companions for pleasure purposes.

"The failure to find on the two other requests submitted is neither inconsistent with the general verdict nor with the two specific requests answered by the jury. The disputed question involves the knowledge or consent of the master. Even if the chauffeur had the consent of the master, in view of the answer to the second question the master could not be held liable. In the case above cited the automobile was being used by the chauffeur with the permission of the master, and while the chauffeur was driving the car, accompanied by others, the plaintiff was injured. Under these circumstances in that case the master was relieved from liability. Motion to set aside the verdict is denied."

Hour Record to Chassagne on Brooklands.

When, in April last, Jules Goux crowded 106 good English miles into a single hour on the Brooklands track in England with a 30-horsepower Peugeot car, it was considered to be pretty good going; and it was. It was a world's record, in fact. Now, however, another driver, Chassagne this time at the wheel of the 12-cylinder Sunbeam, of which great things were expected, has succeeded in squeezing another 1.9 miles into the hour. He traveled just 107 miles 1,672 yards in one hour flat on Thursday, Oct. 8th, and his performance, needless to point out, constitutes a world's record. His average speed figures out at 107.95 miles an hour. The record was made in the second trial, a previous attempt being abandoned because of tire trouble. During the whole of the record-breaking run the car ran like a clock and there was nothing in the way of mechanical trouble to stop it, despite its truly terrific speed.

Some of Chassagne's laps were made at a speed of 118 miles an hour during the earlier part of his run but later he dropped down to 114 and slightly lower to assure safety.

Wet Course Mars St. Louis Racemeet.

Not satisfied with his failure to establish some sure-enough records in St. Louis on Sunday, 19th inst., J. Alex. Sloan and Disbrow and Heineman and Hearne and Endicott decided to "stop over" until the 26th and to take another chance at running ahead of old Father Time. But another old fellow, old J. P. this time, again intervened and the meet had to be abandoned. But it was not abandoned until Disbrow had whirled around the track a couple of times in his Jay-Eye-See Case; he had to quit because the mud spattered his goggles. A little later, Disbrow and Endicott and Heineman went out on the track together with the avowed intention of smashing every record up to 75 miles, but after 10 miles of slipping and sliding they were compelled to give it up to save their own necks.

STATE, PROMOTING RACE AT FAIR, LIABLE FOR DAMAGES

New York State Held Accountable for 11 Deaths at 1911 Racemeet—Court's Language that Frees Spectators from Negligence.

When automobile races are held at a State fair and are promoted for profit by the organization which manages the fair, the State is liable for damages which may be caused to spectators through accidents such as occur when a car leaves the track and strikes spectators; this is the gist of an opinion handed down last week by Judge Irving G. Vann, referee of the New York State Board of Claims, in passing upon claims made for injuries sustained by spectators at the races at the 1911 New York State Fair when Lee Oldfield in a Knox crashed through a wooden fence and killed 11 people.

Besides recommending sums which should be paid to the claimants, Judge Vann placed all liability upon the State and discarded the plea that the spectators were guilty of negligence in standing along the fence at the outside of the second turn, his decision conflicting with others which held that when spectators of their own free will attend a dangerous performance, any damage which results falls on themselves.

"There was no contributory negligence on the part of the decedents or the living claimants," ruled Judge Vann. "They attended an exhibition given by the State, on its own ground, upon its invitation and after paying the admission fee charged. The grandstand was full. They stood by the fence, and where else could they stand and see the race which they had paid to see? What everybody did in the presence of the managers, anybody could do. A multitude of people stood by the fence at various points, and the fence looked like an adequate guard, although it was not in fact. There was no other place to stand if they saw the race at all. They were allowed and expected to stand where they did. No warning of danger was given and they had reason to believe the place was safe. It does not expressly appear that they knew the danger of auto racing in general, or the particular danger in this race, and I cannot find from the circumstances that such unskilled observers knew or should have known it. They had not had the experience and the opportunity to know that the commissioners had. They stood where they had a right to stand in the place provided for them, and in doing so they were not guilty of contributory negligence.

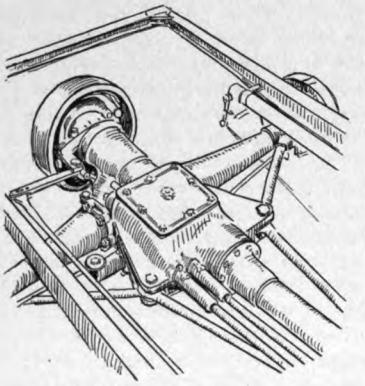
Digitized by Google

"The great danger to spectators in automobile races is the strong tendency of a car to leave the track and run over the people. In case of an accident, whether from skidding, the explosion of a tire or other causes, as a rule the car leaves the track unless it is guarded in some way so as to prevent it. This track was not guarded at all, for the fence afforded no protection to speak of against a car weighing from 2,500 to 2,700 pounds, going at a rate approaching a mile a minute.

"The State owned the track, invited the people to attend, charged an admission fee, which gave the right of entry to any part of the grounds except the grandstand, and made money out of the races. It was not acting in a governmental capacity as in the case of hospitals, prisons, etc, but as the proprietor of a race track. The track was of such shape, form and extent, of such construction and with such slight protection against a car running off, that it was not a suitable and proper place for such a race, having in mind the safety of the spectators invited to witness the same.

"The Legislature had appropriated $40,000 for construction and repairs during the year 1911 and substantial protection could have been provided from the gate receipts, at slight expense when compared with the cost of the track, by erecting guards or other agencies to arrest the force of the car and stop it if in case of accident, it should start to leave the track.

"While the expense of some of these methods for protection cannot be overlooked, it weighs less than human life in the balance on the other side. If a race cannot be held without inherent and extreme risk to life and limb, the command of the law is that it must not be held at all.



"Certain precautions were taken by the commissioners, who were men of high character and standing, but naturally anxious to keep down expenses and increase the income from the fair. The race was held under the auspices of the American Automobile Association, a strong national society, well officered and managed, which controls most of the automobile races in the country. The drivers were carefully selected and were competent.

"The State Fair Commissioners were the officers and agents of the State and what they did and what was done under their direction was done by the State, the same in effect as if they had been the agents of an individual or the officers of a private corporation that owned the track and gave the exhibition. The track belonged to the State, the fence was built by the State, the fair was held by the State, the danger was created by the State, the invitation to attend was issued by the State and the negligence was the negligence of the State."

WORM DRIVEN DAIMLER CAR HAS BRAKE ON WORM SHAFT

Friction-Drive Electric Motor Starts Engine and Gearset is Mounted on Rear Axle—Unique Setting of Cantilever Springs.

One of the latest of the Daimler cars, a four-cylinder 20-horsepower car—it is a new model throughout, incidentally—has an interesting rear axle arrangement, combining as it does several features in a new way. The axle is worm-driven, with a Lanchester type worm, and the worm shaft extends rearwardly through the casing and carries on its end the drum on which the foot-brake acts. The brake is actuated by a bell-crank to which the long brake rod, running along the side frames, is attached. The brake in

DAIMLER REAR CONSTRUCTION

this position back of the rear axle is accessible and adjustments are easily made. The unit construction idea for the rear axle group is carried out by attaching the gearcase to the axle casing, while the torque tube through which the propeller shaft runs is bolted rigidly to the gearcase. Thus the rear axle, the gearset, the torque tube and the foot brake are mounted as a unit. Braces extend from the ends of the axle casing to brackets cast on the gearcase on each side, and thence forward to the front end of the torque tube. The gearset may have either three or four speeds, as the purchaser may desire, and the final drive ratio is optional.

Another feature of the Daimler "20" is the adoption of springs of the Lanchester or cantilever type. A single semi-elliptic spring is placed in an inverted position on each side of the car—that is, the short leaves are on top instead of being at the bottom, as is usual in semi-elliptic springs. The front end is shackled to the main frame, the middle is pivoted to the frame and the rear end is rigidly clipped to the axle casing. One of the advantages of this form of spring construction is that the greater part of the weight of the spring becomes "sprung weight." A curious feature is that the springs are not parallel with the frame, but are further apart at their rear than at their front ends.

The motor is the regular Daimler-Knight, developing 36 horsepower at 1,500 r. p. m. The carburetter is a new Daimler design and is of the multiple jet type with passages communicating with the jets closed by steel balls when the suction of the pistons is not sufficient to lift them and draw from the jets. Only one jet is in constant communication with the mixing chamber, and that is the jet that is adjusted for slow running. The faster the motor runs the more steel balls are lifted and the more jets are opened up and drawn upon.

It is notable that provision has been made for the installation of a dynamo for electric lighting and for an electric starter taking its current, of course, from a battery charged by the dynamo. The starting motor drives by frictional contact of a small roller with the flywheel of the engine; depressing a pedal brings the roller against the flywheel and starts the motor.

Children May Drive in Fort Smith.

Legislation against children driving automobiles is the rule in most cities, and it has remained for Fort Smith, Ark., to furnish the exception in passing an amendment to an ordinance permitting a child of any age to drive a car "if unaccompanied by parent or guardian." The ordinance previously forbid minors under the age of 18 from driving, but upon the request of numerous car owners Mayor Read introduced and had passed the amendment, which went through by a four-to-one vote. The opponent of the measure, Commissioner Bruce, said that the presence of an older person could not eliminate the element of danger in the driving of children.

The ordinance now reads: "No child under 18 shall drive an automobile upon the public streets or boulevards unless accompanied by parent or guardian." This apparently means that if a six-year-old boy wishes to drive a car he may do so if accompanied by his mother, even if his mother doesn't know a steering knuckle from a "gas" tank. The council also rescinded the ordinance forbidding cars to stand in front of office buildings.

One Way to Use a Tire Pump.

A tire pump often can be used to good advantage in cleaning out a plugged gasolene pipe. A quick, sharp stroke of the pump will force air into the disconnected pipe at considerable pressure, and unless it is very tightly plugged will blow is clear.

TOOL TERMINOLOGY THAT AFFECTS EFFICIENCY

Lost Time Results From Having Many Names For One Thing, and Using One Name For Many Things—What Can Be Done By Standardizing Terms—System of Designating Fractional Measurements.

In the strenuous, almost desperate, efforts that constantly are being made to increase efficiency in manufacturing plants, nothing that is done by man or machine is considered insignificant enough to overlook if there is any chance of bringing about an improvement. No time loss is too small to be worried over until eliminated. Nothing that holds back production in the smallest degree is intentionally disregarded. There is a detail, however, that actually is overlooked in some cases because, perhaps, it is not something that the efficiency expert can stand and observe or detect with the aid of his stop-watch. If a man asks for one kind of a tool and gets another, time is lost in rectifying the error. If the asker calls a thing by a name that the man asked does not understand, time is lost. If both men know several names for one tool, or several tools are known by similar names, time is lost. Loss of time is a conspirator—the arch-conspirator—against efficiency.

Eight Names for One Hose Clamp.

That such an apparently insignificant matter as the nomenclature of tools and parts can have an appreciable effect on the efficiency of a shop seems, perhaps, rather improbable at first thought; but that such actually is the case is indicated by a recent experience of the Philadelphia Fire Department. A workman was sent from one part of the shop to the other for a hose clamp. After several unsuccessful attempts had been made to find the article, the foreman went and showed the workman just what was wanted. The whole trouble was that the foreman used a name for the hose clamp that the workman did not recognize, and so he did not know what to bring even when he saw it. The incident started an investigation that revealed the fact that the hose clamp had no fewer than eight different names in that particular shop, while other parts and many tools had two or more names and some never were called by their proper names at all. The standardization of nomenclature that followed was thorough and complete, and the efficiency of the shop has consequently been increased, according to estimates, 5 per cent.

Changing the name of a rose cannot change its smell in the least; and the same may be said of that interesting little animal, the pole-cat. But if someone wanted a rose, and they brought him a pole-cat, or vice versa, there might be trouble, or at least annoyance. In other words, calling things by names that don't belong to them, or using one name for several things, or using several names for one thing—such practices are more or less apt to lead to confusion, if nothing worse.

What Makes the Wheels Go 'Round.

Yet that is what is done in a great many machine shops—automobile repair-shops and other places where the mechanical arts are practiced. Of course, in time, if the shop is not too big, the men get used to each other and learn to make allowances for nomenclatorial idiosyncrasies. But it is inevitable that more or less confusion and delay should result from such a state of affairs, and it would not be such a bad idea if the foreman—or foremen, if the shop is a big one—and the tool-room men were instructed as to the names to be used in doubtful or ambiguous cases; in this way there never would be any question, in that shop at least, as to what any given name might refer to.

While the mere avoidance of bother and inconvenience is a matter worthy of consideration, it by no means the only object to be gained by the establishment of uniform terminology for tools and parts. It is necessary only to figure up the total time lost in a week through misunderstandings and explanations to appreciate the fact that wasted conversation means wasted money—not much, perhaps, in the case of one man, but often an almost alarming total when figured up for a large shop. In other words, uniform terminology makes for efficiency, and it is efficiency that makes the financial wheels go round, and in the last analysis the financial wheels come very near to being the "whole works."

Practical Joking in the Shops.

Let it be said right away that this has no reference to the time-honored custom of sending a "green kid" to the tool-room or to some mechanic for such mythical instruments as the "left-hand monkey-wrench" to screw on a nut with a left-hand thread; or the "half-round square"; or "half a quart of goose-oil"; or to the blacksmith with a small tool (nicely made of lead) to be tempered. That is something altogether different and doubtless will endure as long as machine-shops are manned by mechanics who have a more or less untimely sense of humor.

An English or Canadian mechanic in an American shop is likely to be misunderstood when he asks where he can get a "spanner." He will be proffered various wrenches of those weird types that have hooked ends, projecting studs and other devices for turning nuts or collars that are not adapted to be turned with the conventional wrenches with square or hexagon jaws or openings. If he asked for an "open-ended wrench" he would get what he wanted right away, very likely, though on this point there are differences of opinion. Some men will call it a "solid wrench" because it is made all in one piece. Others will take for a solid wrench only one that surrounds the nut it fits. Others, again, will apply the term only to a socket wrench. And sometimes a box wrench, which is a socket wrench too, is a solid wrench.

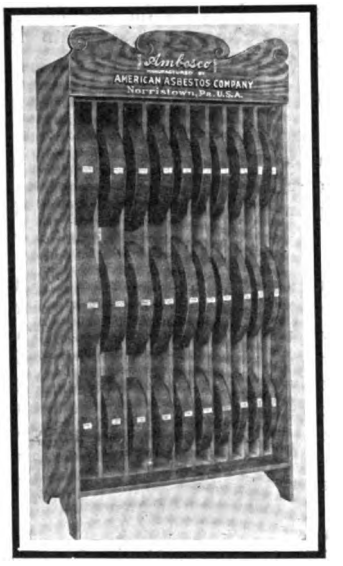
Queer Names for Common Wrenches.

Then there is the tribe of alligator wrenches, which are ofttimes decorated with such titles as "angle wrenches," "crocodiles," "fish-heads" and others equally fanciful. "Tap-wrench, "tap-holder," "die-wrench," "screw-wrench" are some of the terms that are tied to the same tool, while the last one sometimes goes for the old reliable monkey-wrench — and so does "shiftin'-wrench," and other names of obvious derivation. Truly, the wrench family is badly mixed up as to its nomenclature.

While it does not come under the head of tool nomenclature, there is a curious and persistent habit in naming measurements that has survived from the days when mechanics were less well educated, perhaps, than most of them now are. If a man is told to drill a hole 9/16 he will have to fuss and figure to decide what drill to use; but if he is told to make it "half-inch and a sixteenth" he will be at home right away. Eleven sixty-fourths would set his brain awhirl, while "five thirty-seconds and a sixty-fourth" would be perfectly compre-

Digitized by Google

hensible. The fact that drills are marked in a sensible way does not seem to have had much effect; and it is a fact that tool-room men have taken the trouble to mark drills and other tools in the cumbersome but sometimes better understood system, to save time and confusion. Of course, there now are plenty of shops where this plan is unknown; but there also are plenty where it is necessary to say "three-quarters and a sixteenth" to be intelligible to most of the men. Why, it used to be the custom in some of the big railroad shops to mark dimensions on blueprints with figures that looked like heiroglyphics, but which were as clear as daylight to the men. Of course, the foreman understood the "office markings," but it was easier to have the draftsman do a little extra work than to explain things to the men.



Split-pins, split keys, spring keys, spring cotters, cotter-pins, split cotters, spring-pins, cotter-keys, cotters—all are applied to the two principal types of bifurcated devices that keep nuts where they belong. In many shops a flat two-part key is a cotter, while the round affair with a loop eye is a split-pin. But while this works very well in practice where it gets started, it is hard to get it under way, and even the manufacturers of such things are far from unanimous in their selection of names. And the steel washer with a split in it and the edges of the split turned in opposite directions, which is a safeguard against the backing off of nuts and bolts, may be a lock washer, a spring washer, a nut lock, a split washer, a spring lock—regardless of the fact that some of those names are equally applicable to other devices designed for the same purpose. Not infrequently it is a matter of some little difficulty to get just the right thing in a hardware store because of this confusion; the only safe way, lacking an immediate comprehension, is to describe the article carefully and in detail and identify it on sight.

There are dozens of parts of all sorts of machines that are equally promiscuously christened; every class of manufacturing has its peculiarities in that respect, and the automobile is by no means an exception. It is certain that such tangles never will get straightened out if their straightening is left to the rank and file, for each man will make use of the names that he likes best, or that seem, to his way of looking at it, to best describe what he has in mind, or that are best understood by his associates. The only way would seem for manufacturers and others "higher up" to agree on the most suitable names and stick to them, and for tool-room men, stock keepers and foremen to adhere to the nomenclature agreed upon and by degrees make it a good deal easier to use the right names than the wrong ones.

PUTTING BRAKE LINING IN REACH OF RETAIL TRADE

Ambesco Makers Inaugurate Selling Campaign Among Jobbers and Retailers—Clever Display Device to Assist the Dealer.

Brake lining may not appear a compelling merchandizing article so far as its display qualities are concerned, but that it is possessed of more or less undeveloped possibilities in this line is the belief of the American Asbestos Co., of Morristown, Pa., maker of Ambesco, which has inaugurated a campaign among jobbers and retailers; its activities hitherto have been confined largely to the manufacturing trade.

AMBESCO DISPLAY RACK

As a feature of its campaign, the company has devised a display rack which not only brings its wares to public attention in supply and accessory stores, but places the whole line of lining sizes in view; the rack, which is attractively finished, consists of ten sections divided by upright partitions, each section being separated into three subdivisions as shown in the accompanying illustration. Rolls of narrow lining are placed at the left and the wider sizes at the right, and each roll bears a label stating its width.

The case is designed to permit and induce the jobber or retailer to carry a complete stock and to afford a service to the car owner which will tend to popularize the lining; the Ambesco makers believe that the lining which is displayed and easily obtainable by the car owner will have a greater sale than one stored in an obscure corner on a shelf or under a counter.

In addition to this feature of its sales plan, the company has worked out a cooperative advertising plan whereby large buyers of Ambesco will be assisted in the local advertising of the product.

Cranking with Cold Carburetter.

Whether the incentive was the warmth of the weather or a desire to benefit automobiling humanity it is not stated; but during the past summer the Studebaker engineers retired to the depths of a cold storage vault with a Studebaker "six" and made some interesting experiments on the volatility of gasolene at low temperatures. It was found that the lowest temperature at which gasolene—the ordinary commercial liquid—would vaporize from a piece of waste soaked and dropped on the floor was 5 degrees Fahr.; incidentally, the "six" was started without difficulty at this temperature. At a slightly lower temperature the gasolene refused to forsake its liquid state and there was "nothing doing" on the motor. The application of a cloth, soaked in hot water, to the carburetter intake warmed things up sufficiently to permit starting, however. And after leaving the car over night in cold storage—very cold, for it was 12 below zero—the hot cloth application was effective in getting the engine under way. The fact that the cranking was done by the electrical system with which the car is equipped helped some, of course.

Ball Bearings that Save Current.

A great many proprietors of machine shops—particularly small ones—are pretty well satisfied if their shafting runs fairly freely in the bearings and the bearings do not heat up. It is possible to obtain much better results than that, however, according to the Hess-Bright Mfg. Co., of Philadelphia, which cites the case of a shop in which a little 3-horsepower electric motor drives the entire equipment; and that the equipment is by no means insignificant may be gleaned from the list of machines, which includes seven automatic machines, a universal miller, a punch press, two 11-inch lathes, a two-spindle ball bearing drill and a floor grinder—13 in all. All the hangers are ball bearing, as are some of the machines, so the transmission friction is low.

Misplaced Valves Make Trouble.

After having removed the valves of a motor for any reason, the greatest care should be taken to replace them correctly; that is, to put them in the seats they came from. If this is not done it is more than likely that all will leak more or less and further, the clearance between the tappets and the stem ends is liable to be wrong.

"FAIR" NOT "UNREASONABLE" JOY'S SERVICE DEFINITION

Says Dealer Should Weigh Problem by "Could we do the Same Thing for all Owners Unasked?"—Fairness Earns Good-will.

How far should I go in giving service? The question has cropped up to cause thought on the part of every man who has had to do with the making and selling of cars and the degrees of what is often improperly termed service are many and vary widely. Recently Henry B. Joy, president of the Packard Motor Car Co., gave a talk to his sales force on the service question as viewed by himself and stated that there is a limit beyond which no man should go. To secure a condensation of his views Printers' Ink asked him for his views on service.

"The quotation attributed to the late Marshall Field is ideal, that 'The customer is always right.' But unfortunately, all people are not exactly fair," said Joy. "This should be the guide. The customer should at least be assumed to be right. But now and then an owner and now and then a chauffeur will press for things which they ought not to have in the hope of getting them free. If they get what they ask for they think they are entitled to it, and therefore no credit accrues to the giver.

Must Treat All Alike and Fairly.

"To treat all people alike and fairly should be the slogan of every man in business. My idea has always been that it is far preferable to treat the trusting, confiding customer who makes no bluff and bluster as fairly as any other. In these days of keen pressing of claims by those who enjoy the game of bluff, seeking to get that which possibly they themselves feel may be a trifle beyond the limit of justice, it is exceedingly difficult to conduct a large and complicated business to the satisfaction of all customers. It has become plainly evident in the conditions of business to-day, as the result of the attitude of storekeepers who do not conduct their affairs squarely on the one-price, equal-treatment-to-all basis and force customers to negotiate for their rights, that the adoption of the fixed rule, 'The customer is always right,' is not easy.

"Any concern today adopting the fixed rule, 'The customer is always right,' and yielding always to the pressing demands of the importunate negotiator, would indeed be short-lived. It is a curious thing that in infrequent instances those most able to pay their shot are the ones most importunate in pressing for privileges which no business house could permit at all and survive in the struggle.

"The one-price-marked-on-the-goods house is the place where a customer is most likely to get full value for his money, rather than the house where hieroglyphics mark the selling price, permitting the adroit storekeeper or salesman to extract from the trusting and uninformed customer more than the article is worth. Bargaining and haggling and negotiating, as is the general custom abroad, is very offensive to the American who wishes to order by mail or telephone or telegraph without wasting his time.

Judgment Rather Than Fixed Rules.

"That is the same problem which is involved in the service end of any business, but it is difficult to put down hard and fast rules of what is exactly proper service. It must be left to the good judgment of the employe; meeting the conditions according to his good common sense. Where he feels that the customer is asking more than he should, the measure must always be 'Could we do the same thing for every other customer without their asking for it?' This is the basis of the equal-treatment-to-all policy.

"Of course, the business of installing a complicated piece of machinery, or an organ, or other device, must include the cost of instruction in operation. The negligent parties in the care of a device thus installed must therefore be responsible for their own negligence and pay for their own faults, if the equal-treatment-to-all policy is maintained. Otherwise, those who get along without any service and take excellent care of and intelligently operate the device, and are no burden upon the manufacturer—because it is upon the manufacturer that this burden must ultimately fall—are paying for bills which justly ought to be paid by those who are negligent.

Salesman Often Fears to Offend.

"It is very difficult for a salesman to avoid being placed in an embarrassing position when a distinguished citizen makes assertively claims for service which the salesman feels he is not justly entitled to have. The distinguished presence and distinguished ability with which a keen lawyer or business man may present his case with the salesman, and the fear the salesman has of offending him and of driving away his patronage renders the salesman weak and fearful of taking an erroneous position on behalf of the house he represents.

"The way to overcome this embarrassment, in my opinion, is to induce adroitly and inoffensively by illustration or otherwise the customer to put himself in the place of the company the salesman represents. In most cases this changes the imperious demand of the possibly irritated patron to a thoughtful study of the possible righteousness of his cause.

"It is clear that the customer cannot be always right, but it is clear also that the duty of the salesman or business house toward the customer must be that he is assumed to be right, and presumed to be making only a reasonable and fair and proper demand. The skill of a salesman in digesting the principles of the house he represents and adroitly presenting them so as not to offend and to gain the confidence and good-will of the customer is the all-important thing.

Good-will Thing of Chiefest Value.

"The good-will of the patrons of an institution is the thing of chiefest value to it in the lapse of time to maintain its industrial welfare in the struggle for business success. I assume that the good-will of a customer cannot be purchased. He cannot sell his good-will. It will not stay bought. If a commercial house does not deserve good-will by reason of the quality of its goods, by the methods under which they are sold, by the service rendered, that good-will upon which the company's success depends will slip through its fingers. If we know and can prove that we are right, fair, equitable and sound in our principles, the customer's good-will will attach involuntarily. It will belong by right of having won it fairly by right of deserving it. Is there any other possible solutiton?"

Women "Garagemen" Form Association.

The extent to which women are interested in the garage trade in Chicago was made known last week, when the Women's Auxiliary of the Chicago Garage Owners' Association was formed and plans were formulated for an old-time harvest festival and ball to be held November 15th; of Chicago's garages more than a dozen are said to enlist the active services of women, while about a half dozen are operated exclusively by women.

Soldering in Electrical Work.

The reason why soldered joints are so much to be preferred to mere metallic contact in electrical work is that in time the metal surfaces become oxydized, no matter how close the contact, and the passage of current is more or less interfered with. As the oxydization is caused by the air, the protection afforded by the solder prevents it and there is no possibility of the formation of resistance in the joint. Incidentally, the solder forms an excellent conductor of the electric current.

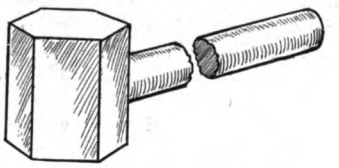
RECENT DEVELOPMENTS in ACCESSORIES

Switch That Groups and Dims.

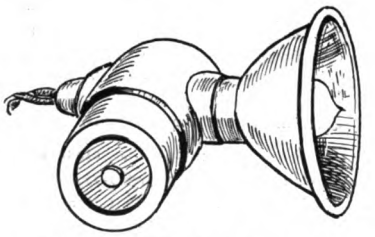
The designing of a satisfactory controlling system for the electric lights of an automobile is less simple than it might appear at first thought, for not only is it required that the lamps should be controlled in different combinations without the necessity for turning the lamps on or off separately, but in some cases it is demanded that the headlights should be capable of being dimmed for urban driving in order to comply with the laws that prohibit dazzling lights.

A device that concentrates into a little round casing 3⅛ inches in diameter the functions of a light controller and a headlight dimmer is the Hartman rotary switch and dimmer, manufactured by the Hartman Electrical Mfg. Co., of Mansfield, O. A thumb-lever controls the light groupings, which ordinarily are side and tail lights burning, head and tail lights burning, all lights burning or all lights off. A special construction gives a combination of left side and tail light, so that the car may be left at the curb with the legally required lights burning, but without consuming more electric current than is necessary.



The dimming feature consists of a center push-and-pull switch which throws the headlights into series instead of parallel, the series connection cutting in half the voltage to each lamp and reducing the light and at the same time the current consumption. It is stated that with the dimmer cut in the current consumption, based on 16-candlepower lamps, will be a little more than one ampere more than with the usual 4-candlepower side lights. As there is no resistance there is no heating and no loss of current from this cause. The center push-and-pull switch also can be used for controlling an extra circuit, such as a dome lamp in an enclosed car. The switch can be operated by feeling in the dark, as it has a ball-catch device which plainly indicates the successive steps, a steel ball, backed by a spring, dropping into depressions that mark the positions.

Here's the Magnetic Handy Lamp.



There can be no gainsaying the fact that a handy lamp is a handy lamp indeed; and by way of making such a device still handier the Adams-Bagnall Electric Co. of Cleveland, O., has evolved a lamp that can be put 'most anywhere and that will "stay put"; it is styled a magnetic handy lamp and it is shown by the accompanying illustration. In its simplest aspect it consists of the usual lamp receptacle and reflector, the bulb being a tungsten rated at four candlepower and operating on any of the voltages common to electric lighting and engine starting systems. Coupled in parallel with the bulb, there is a small electro-magnet which makes it possible to "stick" the lamp on any iron or steel part of the chassis in any position.

HARTMAN ROTARY LIGHT SWITCH

WAGNER VALVE CAP TOOL

A-B MAGNETIC HANDY LAMP

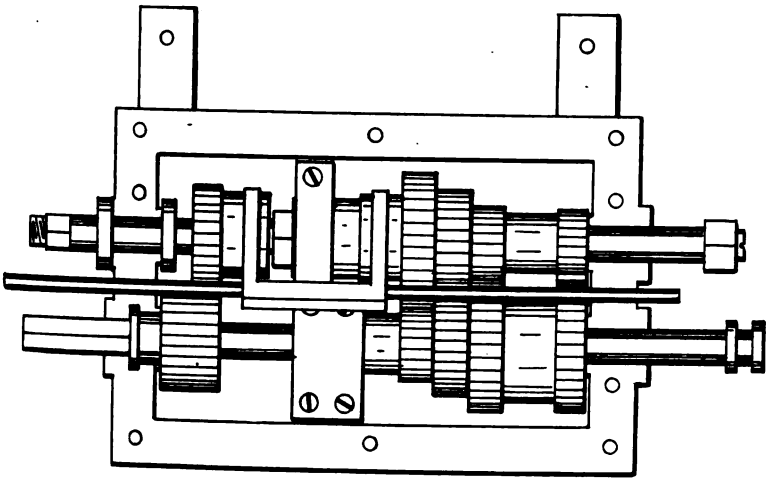
Although the magnet is very small—the whole device weighs but 13 ounces—and therefore consumes an amount of current that is practically negligible, it has a pull of some 13 pounds, thus making plain that no ordinary amount of engine vibration can jar the lamp loose. The main body of the lamp, which serves as a housing for the magnet is made of aluminum and the magnet face measures 1⅝ inches across. The widest part of the reflector measures 2½ inches from edge to edge. The device is supplied complete with all the necessary wiring and terminals, so that it can be attached directly to the battery or to any other convenient outlet at any part of the car.

Wrench for Removing Valve Caps.

Tools for removing valve caps with hexagon wrench sockets are furnished with a good many cars, but in many cases the wrenches are not sufficiently powerful and in other cases they are lost or mislaid. Anyway, it seems to be the case that the tool kit is minus such a wrench oftener than it is "plus," and to fill the want the Wagner Specialty Co., of 18 West 63rd street, New York, has brought out a line of valve cap wrenches that are substantial and amply powerful—or, rather, that have plenty of leverage by reason of handles that are long and strong.

The hexagon head, which is simply a short section of hexagon steel hardened, is fitted to a cast steel handle of a length proportionate to the diameter of the head. That's all there is to it, except that the tool will remove a tight cap and will put it back again as tightly as need be, so that there will be no leakage through insufficient screwing down. Various sizes are made to fit various makes of valve caps. The price is $1.50.

Windshields and Reflected Lights.



Anyone who has stood in front of a big show window, with a strong light at his back, and tried in vain to see what was behind the glass—and who hasn't?—can appreciate the fact that reflected light may make it impossible to see through perfectly transparent glass. The phenomenon is brought home to automobile drivers by the fact that lights reflected in glass windshields produce exactly the same effects, the extent to which vision is interfered with depending upon the brilliance of the reflected light as compared with the light on the road ahead. The disturbance is caused by the reflection into the driver's eyes of lights projected from the rear, and by tilting the glass so that the reflected rays are shot upward, out of eye range, the nuisance will be eliminated. If the windshield is of the double type, it may be sufficient to tilt only the upper section.

GEARS ALWAYS MESHED IN NOTHACKER TRANSMISSION

But All Gears Are Stationary on Direct Drive—Ingenious Gear-Clutch System that Permits Unusual Method of Control.

There is nothing particularly new in a gearset in which the gears are always in mesh; neither is the gear-clutch system at all novel. Both ideas have been exploited in various forms and combinations. There is novelty, however—at least, the patent office does not deny that such is the case—in a constant-mesh, gear-clutch, change-speed system that has been developed by A. J. Nothacker, of 856 East 10th street, Brooklyn. Nothacker owns the C. J. Paulson patents, and has been working on the problem of reducing the invention to practical form for some years; the gearset now has been prought to practical commercial form and Nothacker is prepared to grant licenses for its construction.

NOTHACKER'S GEARSET IN WHICH PINIONS ARE STATIONARY ON DIRECT DRIVE

In the form shown in the accompanying illustration, the gearset provides for four forward speeds and a reverse. The most striking characteristics are that, while the gears never are separated, those not engaged in driving are stationary when the direct drive is "in" and are entirely isolated from the shafts, which, though passing through the gears, do not touch them except when in driving connection; that on the top speed the drive is direct with the primary shaft running as if solid, with no gears in motion and the lay shaft stationary; and that though the reverse and the three gear speeds are controlled by a lever and the direct drive by a pedal, no harm can result if, for instance, the direct drive should be engaged by means of the pedal while the lever was in the reverse or any intermediate speed notch, for the simple reason that the engagement of the direct drive automatically isolates the primary shaft from all the rest of the system.

As for the mechanical means by which these things are accomplished, they are quite simple. The shaft shown at the top of the illustration is the primary shaft—that is, the shaft driven directly from the clutch shaft—and the "cone" of three gears runs solid; when one gear turns all three must turn, as they are, in effect, a single piece.

By means of a sliding clutch, just at the left of the largest of the three cone gears on the primary shaft these gears are made to run with the primary shaft or to remain stationary when the shaft runs, according to the clutch position. A second clutch is interlocked with the first and moves with it, acting on the single gear at the extreme left of the primary shaft. The second clutch and the gear move together longitudinally, the wide-faced gear on the lay shaft permitting such motion. When the clutches are slid to the right the cone of gears is clutched to the shaft, as is also the single gear at the left, and the two parts of the shaft are freed from each other so as to be capable of moving separately and at different speeds.

The secondary or lay shaft is solid from end to end and is slidable longitudinally through the gears. The three cone gears meshing with the primary shaft gears are independent of each other and when the control lever is in neutral are independent of the shaft. The wide-faced gear at the left turns whenever the secondary shaft turns. On that part of the shaft that is in the coned gears there is a squared part capable of engaging and driving one gear at a time. By sliding the shaft one way or the other any one gear can be clutched to run with the shaft. The three gears at the extreme right—one on each shaft and one intermediate—are the reverse gears. The one on the secondary shaft is under clutch control the same as the cone gears.

With the foregoing details in mind, the operation of the gearset is not difficult to follow. Assuming that the car is standing and it is desired to start up in the usual way, the gear lever will be placed in neutral, so that the gears on the secondary shaft will all be loose and the high speed or direct drive pedal will be "out" so that the primary cone will be clutched to the shaft, the shaft will be divided and the gear at the left, on the tail-shaft, will be clutched. If now the motor clutch should be "in" the primary shaft and its cone will revolve, and the three cone gears on the secondary shaft also will turn, but loosely; the secondary shaft will remain stationary. By bringing the gear lever into first speed position, however, the shaft is slid longitudinally until the squared part engages with the largest gear, the other gears still running loosely. The drive now will be through the first section of the primary shaft to the secondary shaft through the big secondary gear, through the wide-faced gear at the left and thence to the tail-shaft, which, of course, drives the propeller shaft directly.

Continuing the movement of the gear shifting lever carries the squared part of the secondary shaft to the second and the first gears, brought back to neutral and slid the other way—to the right—the secondary shaft will engage the reverse gear and, of course, rotate in the opposite direction. The direct drive pedal is pushed into operating position against a spring and held "in" by a latch. When the latch is kicked off the high speed is automatically thrown out.

Don't Want Motorette Called Cyclecar.

The American Motorette Co., which recently was organized in Detroit, is one of the newcomers which is anxious that it be known that the Motorette, as its production will be styled, is not a cyclecar but a light vehicle of standard tread designed along French lines. It will be a three-passenger, shaft-driven car with 100-inch wheel base, 18-22 horsepower engine and equipped with electric lights, top, windshield, speedometer, etc., and will be listed at less than $500.

Detroiters to Make Hawk Cyclecars.

F. S. Silver, Duane Tibbetts and W. W. McIntyre, of Detroit, have formed the Hawk Motor Car Co., for the purpose of manufacturing cyclecars. The company is in the nature of a partnership, not a corporation.

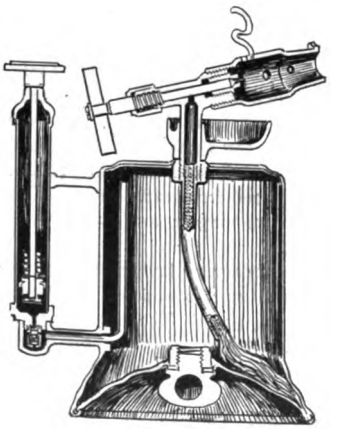
GARAGE TORCHES THAT COMPLETE EQUIPMENT

All Around Usefulness of Such Devices in the Modern Garage—Gasolene, Kerosene and Alcohol Types Contrasted and Their Differences Made Plain—How They are Constructed and How They Work.

If you cast your thoughts backward to the time when you were a boy in short trousers you probably will remember having seen a plumber busily at work beside a blazing, roaring gasolene torch apparently indifferent to the little hell beside him and all unconscious of the awe it generally inspires in those who see such devices for the first time. Or it may have been a shipbuilder dexterously burning the paint from a battered hull preparatory to restoring it to its pristine loveliness. But no matter where you saw the thing, the effect probably was the same: You wondered what made it stay lighted in the young gale that whistled between your legs; you wondered why it gave out such an infernal roar; and maybe you wondered just when the thing would go up with a bang! leaving a little smoke, perhaps, and a suggestion of burning brimstone.



That was long before there were any automobiles, of course, or it was so long ago that automobiles were few and far between and not even those who owned them had gotten over squabbling about the correct pronunciation of "garage" and "chauffeur" and "chassis" and other kindred words imported from France along with the smell of gasolene. At that time gasolene was used chiefly for cleaning gloves and taking the stains out of carpets. A little later it became useful for other things, such as causing legislation against excessive speed, making necessary a material increase in the size of Standard Oil's already bursting coffers, and influencing controversies concerning horsepower formulas. The public garage followed as a matter of course.

Now, if there had been as many garages when you gazed on the plumber's activities as there are now you probably would have had your first introduction to a gasolene torch in one of them. For, barring plumbers and painters, garages use these portable soldering irons or doing small brazing jobs or hardening small tools or bending things that won't bend until they are heated—there are a thousand and one uses to which they can be put, especially where the garage is not equipped with a sure-enough forge, and few of them are large enough for that or have work really requiring one.

FOUR TYPES OF SMALL TORCHES THAT ARE SUITABLE FOR USE IN THE GARAGE

helfires more than they are used anywhere else; it has gotten to be that a garage scarcely is complete without at least one gasolene torch and a whole lot of them have two or three, which in itself is ample evidence of their usefulness. Any garage proprietor will testify that they are awfully handy things to have around for heating

WESTINGHOUSE IN SECTION

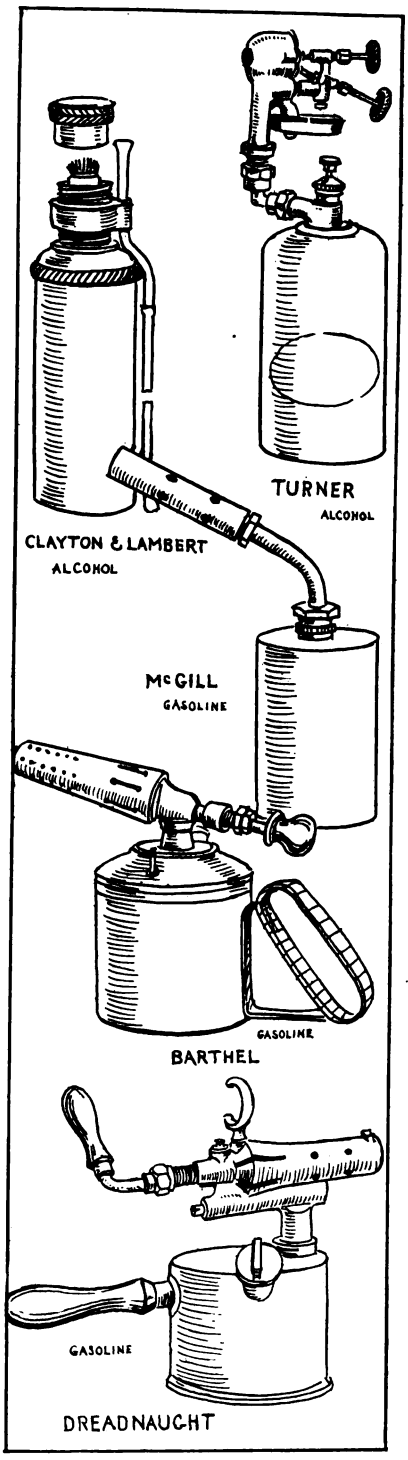
But if you asked that same garage proprietor how or why his gasolene torch works he would probably answer you kindly if he happened to be a kindly man, or he might suddenly discover that he has business in some other part of the shop requiring his undivided attention; also, he might heave a wrench at you on general principles. The chances are ten to one against you that you would get a satisfactory answer and ten to one with you that you had the garage proprietor stumped. Gasolene torches are a mystery to most persons, though it would be better for them if it were otherwise, for the proper care of anything from a "b'il" to an automobile requires a knowledge of its construction.

But before delving into the mysteries(?) of the internal construction of such devices, it is well to mention, casual-like, that they are of three general types. Some of them that belong in the first, and probably best-known class, burn plain, ordinary gasolene, and burn it uncommonly well; others burn the plebian variety of illuminating oil styled kerosene; and others, less numerous though none the less efficient, burn

Digitized by Google

alcohol of either wood, denatured or spirit variety.

Working Principles of Torches.



All of them work on the same principle, and that principle is almost exactly like the principle of the home variety of perfume atomizer that is such a familiar arjunct of milady's dressing table. As an atomizer salesman once said: "You puts your perfume in and the air squirts it out." Only, in the case of the gasolene, or kerosene or alcohol, torches, you puts your fuel in and the air squirts it out. And because it is lighted as it comes out, it issues forth in the form of a roaring flame; it roars because of the pressure under which the vapor issues and also because of the quick combustion. In construction, all such devices are about the same, the essential difference being in details rather than in principle.

In all of them there is a fuel container and a burner that is little more than a needle valve surrounded by a casing pierced with holes so that air can mix with the fuel; some of them have pumps for obtaining the initial pressure to squirt the fuel out—all of the larger sized ones have them—and some of them have no pumps.

Take the Westinghouse torch, for instance, which is shown herewith in section. It will serve as a good example to make plain the working of this particular style. The container itself is made of very heavy brass into which the burner is screwed. The pump, as is shown by the picture, serves also as a handle. The filler cap is at the bottom, which is slightly concaved to make it serve as a funnel. If the tank is filled and after the filling cap is screwed in place, inverted, the fuel level will be just below the top of the small pipe from the pump. Hence, when pressure is put on top of the fuel, the fuel is forced up through the pipe containing the wick to the burner; at the burner, its issuance is controlled by the needle valve, which may be opened or closed by means of a convenient fiber handle. Beneath the burner proper, there is a small drip cup. So much for the construction of the pump.

Method of Starting Combustion.

In operation, the pressure on top of the gasolene in the tank forces the fuel up the burner pipe to the burner, where it will issue in a tiny, fine stream if the needle valve is opened. If something is held in front of the burner the gasolene will drip down into the drip cup which is put there for a specific purpose and is not merely to catch drippings, for there never are any drippings when the torch once has been lighted. The drip cup serves merely as a reservoir to hold a small amount of burning fuel with which to heat the burner. When the burner becomes sufficiently heated, the fuel is vaporized, or gasified, and

SMALL TORCHES FOR SMALL WORK

it is in this state that it is burned. In every torch on the market the principle of operation is exactly the same. The pressure on the fuel starts it through the fuel nozzle where, after being heated, it is ignited as a gas and forced under its own pressure through the casing of the burner, air being drawn into the flame through the holes provided for the purpose.

Air Pressure Pumps and Valves.

Some torches have wicks and some have none; the Westinghouse is one of those that has a wick, and its function is an interesting one. It prevents too rapid flow of fuel to the needle valve, while at the same time it insures a flow through the medium of capillary attraction. Most torches will operate for a long time on an initial pumping, provided they are used where there is not too much draft upon them, and some will exhaust themselves of fuel without further pumping before they finally go out. When torches are used in a stiff breeze, their burners are likely to be cooled too much to permit of proper vaporization of the fuel and they are likely to go out either because of lack of pressure to force the fuel to the nozzle or to force it out of the nozzle. When the burner is hot, the fuel is vaporized quickly and, as it expands, its own pressure forces it out of the needle valve. Consequently, if the burner is permitted to cool, it is likely that not enough pressure will be generated to force the gas out.

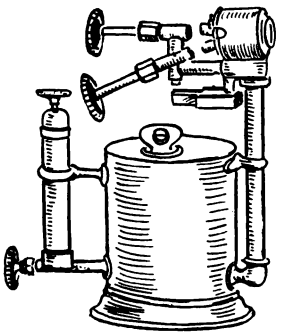
The Westinghouse torch itself is distinctive for several reasons. The pump is rather smaller in diameter than usual, which insures against denting, and the valves can be taken out quite easily for cleaning. Another excellent feature is that the needle valve is set slightly off center, so that every time the flow of gas is adjusted the needle cleans its own seat of any accumulations of carbon or dirt.

Differences That Lie Only in Details.

In the Dreadnaught gasolene torches which are made by the P. Wall Mfg. Supply Co., of Pittsburgh, Pa., the construction is quite different, as at once becomes apparent from the pictures. In these torches, the pump is set partly into the tank and the filler cap is at the top, instead of at the bottom. The method of locking the lower check valve in the pump is ingenious and quite simple. There is a little wire handle-like clip that slips over the top of the pump handle, holding the plunger down and the valve on its seat. In the first picture the clip is shown released and in the second one it is shown in place over the pump plunger. The soldering iron rests are detachable and are furnished with the torches. Both of the models illustrated hold one quart of fuel.

The Barthel torch, which is produced by the Globe Gas Light Co., of Boston, Mass., is still different and is considerably larger

Digitized by Google



in capacity. It holds 2⅕ quarts of gasolene and, by way of making plain its capabilities in generating heat, it is pointed out by the makers that when it is going full blast it will melt a copper rod four-fifths of an inch in diameter in just 2½ minutes. One of the distinctive features of the Barthel is that the orifice of the flame tube is made of nickel, and, it is claimed, cannot be melted even when doing the heaviest brazing with the torch held up very close to the work.

The Turner Brass Works of Sycamore, Ill., produce a great variety of gasolene

BARTHEL ALCOHOL TORCH

and kerosene and alcohol torches, two of which are illustrated herewith; both of them, by the way, differ radically in construction from any of the others. In the first of them, the burner is a double one and instead of drawing air through holes pierced in the flame tube, air is drawn directly from the atmosphere by the gas as it passes the gap between the nozzles and the flame tube. By reason of this construction, the makers point out, it is possible to

TURNER DOUBLE JET GASOLENE

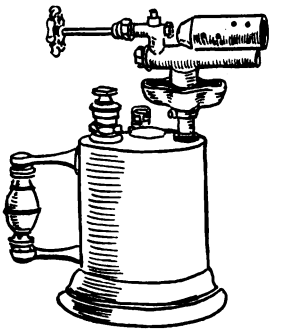
obtain nearly 3,000 degrees of heat Fahr. In this torch, too, the filler cap is at the top and the pump serves also as a handle. The consumption of fuel is about three-quarters of a pint an hour.

In the second Turner torch a laudable attempt has been made to produce a device for a special class of work requiring great heat and a long reach. For this reason the pump is tubular in form and all its mechanism is completely enclosed. In length, it is 5 feet 9 inches over all and the diameter is but 2 inches. The capacity is three quarts, and the consumption is about one quart an hour. The length of the flame is 12 inches under normal condition, making the torch admirably suitable for thawing frozen water pipes in more or less inaccessible places and for brazing work that requires the application of an unusually large flame.

As already has been made plain, many gasolene torches that have pumps will operate until they are practically exhausted of fuel without further pumping than that necessary to start them in operation; their own heat, in other words, keeps them going. For small work, such as light soldering jobs, it is quite common practice to make small torches that have no pump at all, the initial heat being applied directly to the burner with a match or a little burning gasolene. Once these torches are started they will continue to roar and produce a blast of flame until all their fuel is exhausted.

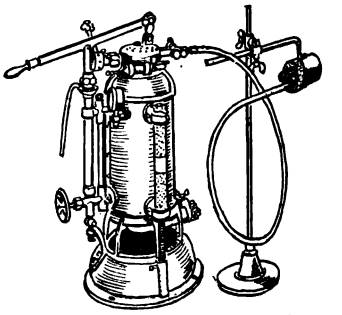
Small Torches for Small Jobs.

The Globe Gas Light company makes one of these small torches that is intended for a number of uses. As the picture



TURNER TUBULAR TYPE

shows, it has no pump, the small handle being merely to adjust the size of the flame. So that the torch can be used for a variety of small and medium sized jobs, two flame tubes are supplied with it, one of them giving a fine needle flame and the other a larger, hotter flame for larger soldering jobs. The capacity of the torch is one-third of a quart and it will burn from one-half an hour to seven hours, depending upon the flame tube used and the size of the flame. The full flame, it is claimed, will melt No. 4 copper wire in just one minute. The Wall company also makes a torch of this kind, the general characteristics of which are the same as those of the larger Dreadnaught torch which has a pump. The smaller one is illustrated herewith.



The Baby torch produced by the McGill Mfg. Co., of Valparaiso, Ind., undoubtedly is the smallest device of its kind and probably it is the simplest, too. As is shown by the picture, it consists of nothing more than a tiny reservoir measuring 2 x 3 inches and a burner screwed into the reservoir. To light the torch it is merely necessary to hold a lighted match under the neck of the burner, thus heating the fuel in the tube and gasifying it. Thereafter the torch will remain lighted for two hours before it requires refilling.

Owing to the comparative cheapness of kerosene as compared with gasolene, torches operating on what the S. O. company styles "lamp oil" appear to be gaining in popularity, and there is much to recommend them for general garage use. As kerosene is more difficult to gasify than is gasolene, some slight change in construction of kerosene torches over those

CLAYTON & LAMBERT KEROSENE

of the gasolene variety is necessary, but that the change really is slight is made plain by the accompanying pictures, one of which shows a kerosene torch produced by the Clayton & Lambert Mfg. Co., of Detroit, Mich., which scarcely differs in appearance from several of the gasolene torches illustrated, and the other shows a kerosene torch made by Boston Gas Light company. In both cases, particular attention has been given the necessity for providing the proper amount of heat thoroughly to gasify the kerosene. The capacity of the Barthel, which is made by the Boston company, is one pint and the heat generated is sufficient to melt a ¼-inch copper rod in 1½ minutes. The Clayton torch is slightly larger, holding one quart of kerosene, and as the flame is larger it generates a correspondingly greater degree of heat.

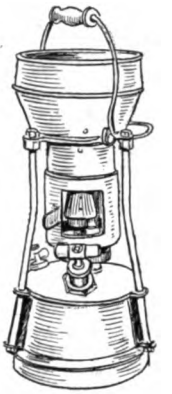
VOLCANO BRAZING TORCH

Alcohol has been long and favorably known as a heating agent, of course, the jeweller's blow pipe and alcohol lamp being a familiar adjunct of the man who, Mark Twain says, "sticks a dice box in his

Digitized by Google

eye and laconically remarks 'new balance staff.'" But the jeweller's lamp and blow pipe scarcely are suitable for use in a garage, though it is true that many a small job can be done well with them. Something capable of more continuous use and productive of more heat is needed and the small alcohol torch fits nicely into this particular niche.

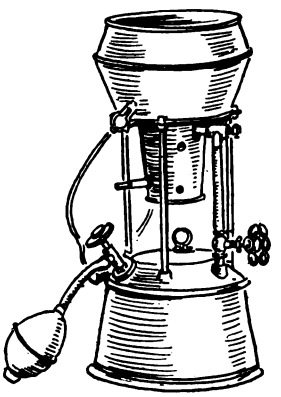
High Temperature from Alcohol.



As is the case with kerosene, the use of alcohol in a torch requires but little change from gasolene construction, the principal alteration being the elimination of of the usual pump. Alcohol vaporizes very quickly and very easily, as any one who has left the cork out of an alcohol bottle can testify. Hence, little heat is required to gasify it and it maintains ite own pressure easily. In the Turner Brass Works's alcohol torch, the distinctive double jet that serves to distinguish the same maker's gasolene and kerosene torches is used. The capacity of the torch is three-quarters of a pint and the consumption about one-quarter of a pint an hour. Upward of 3,000 degrees Fahr. can be obtained with it. One of the excellent features of the torch is that the burner is swivelled so that it can be turned in any position, thus providing a means of directing the flame without necessitating a special support for the torch.

The Boston Gas Light company's Barthel alcohol torch is made plain by the accompanying picture, no explanation of the insides of the device being necessary because there are none, outside of a wick. The Clayton & Lambert company also produces alcohol torches of the same general kind, together with the blow-pipe torch that is illustrated herewith and that is a sort of second cousin to the jeweller's lamp and blow pipe. It consists of nothing more than a reservoir for alcohol, with a wick and a blow pipe terminating in a soft rubber tube designed to be inserted in the operator's mouth.

Bigger Torches for Bigger Work.



Obviously, the principles involved in the small gasolene or kerosene or alcohol torch are equally applicable in a much larger way, for brazing fires, for instance, and for work that requires a very hot fire and a great deal of it. To take care of this class of work, the Volcano Torch & Mfg. Co., of Erie, Pa., has developed the torch shown by the accompanying illustration, along with a number of other styles differing from it only in minor details. In this particular torch, the flame nozzle is mounted at the end of a long flexible pipe so that it can be placed in the most advantageous position for the work in hand. Also, so that the maximum degree of heat can be obtained quite easily, the torch is provided with a good-sized pump and is ruggedly constructed to withstand pressure up to 300 pounds. Both Clayton & Lambert and the Turner Brass Works make brazing torches for similar work.

Closely allied to the gasolene torch, and quite as useful in its own way, is the gasolene or kerosene fire pot which forms such

BARTHEL KEROSENE FURNACE

a familiar part of every plumber's stock of tools. Plumbers use them a good deal for heating solder, but they are quite as useful for any other kind of heating around a garage. In construction they are quite different from the torches, quite as a matter of course, though they are exactly similar to them in action. Making plain that but very little pressure is needed to start them, the Clay & Lambert fire pot, for in-

CLAYTON & LAMBERT GASOLENE

stance, is fitted with a small rubber bulb and a tube in lieu of a pump. In another style, however, a pump is fitted so that greater air pressure can be used and a more intense blue flame obtained. The Barthel furnace which is illustrated herewith is of the same general type, except that it operates on kerosene instead of gasolene.

It is perhaps needless to point out that very nearly any gasolene or kerosene or alcohol torch will operate in any position—right side up, bottom side up, or on its side—and hence there need be no fear that it will go up in smoke if it is operated in any position other than standing on its bottom. Consider the painter who uses his gasolene torch as he would use a paint brush—in any position and almost as carelessly!

Gasolene Export Gain 56 Per Cent.

In August of the present year 13,336,831 gallons of gasolene, valued at $1,933,218, were exported from America to foreign countries; as compared with the shipments in August, 1912, this is a gain of 4,822,871 gallons, or 56 per cent., and $903,164, or 87 per cent., in money valuation. The average price in August, 1912, was 12.1 cents, and in August, 1913, 14.5 cents, an increase of 2.4 cents, or 20 per cent.

The shipments to different countries, with average prices, for the two months of August follow, the 1912 month's statistics in each case preceding those for August, 1913. Netherlands—513,403 gallons, $48,-773, 9.7 cents; none for August, 1913. Other Europe—32,550, $4,466, 13.7 cents; 3,709,198, $321,411, 8.6 cents. Canada—6,-773,213, $784,065, 11.6 cents; 3,985,439, $556,-684, 14.2 cents. Argentina—19,000, $2,802, 14.7 cents; 1,421,169, $248,189, 17.4 cents. Brazil—492,709, $78,153, 15.8 cents; 486,500, $77,814, 15.9 cents. British Oceania—1912, none; 2,016,853, $411,449, 20.4 cents. Other Countries—683,085, $111,795, 16.3 cents; 1,-717,672, $317,671, 18.4 cents. Total—8,513,-960, $1,030,054, 12.1 cents; 13,336,831, $1,-933,218, 14.5 cents.

Cap Peak to Prevent Bedazzlement.

Regulations requiring the dimming of glaring headlights within city limits have effectually eliminated trouble from this cause where such rules are in effect; but in the country, where headlights are a necessity, a driver is liable to be dazzled by the lights of an approaching car, just as the driver of the other car is in the same unpleasant predicament. Henry Sturmey, the English writer on mechanical subjects, has devised a means of obviating such trouble, adopting the principle of the ray-filter, which can be made to shut out any desired light rays while allowing others to pass. Sturmey's device consists of a screen of transparent material of the nature of celluloid worn on the peak of the cap; the material is colored to exclude the rays that cause the dazzling effect, but does not interfere with vision. In the daytime the screen snaps back out of the way and at night is simply pulled down in front of the eyes. It is entirely out of the way when not required and when wanted does not have to be "hunted up."

1,061,554. Transmission-Gearing. Justus H. Naumann, Woodlake, Minn., assignor of one-fourth to J. Paul Scherf, Balaton, Minn. Filed May 7, 1912. Serial No. 95,791. (Friction roller change-speed device.) 12 claims.

1,061,595. Automatic Cranking Device. Coleman H. Brown, Pulaski, Tenn. Filed Jan. 24, 1911. (Spring starter.) 11 claims.

1,026,829. Vehicle-Wheel. Knut A. Read, Oskaloosa, Iowa. Filed April 24, 1911. Serial No. 623,036. (Wheel with springs radially disposed around hub.) 1 claim.

1,026,836. Pneumatic-Tire Fabric Having Annular Elastic Zones. Lawrence A. Subers, Cleveland, Ohio. Filed Oct. 17, 1910. Serial No. 587,631. (Method of weaving tire fabric.) 5 claims.

1,026,849. Bearing. Howard E. Coffin, Detroit, Mich., assignor to Chalmers Motor Co., Detroit, Mich., a corporation of Michigan. Filed April 13, 1908. Serial No. 426,758. (Means permitting endwise removal of crankshaft.) 5 claims.

1,026,851. Running-Gear for Motor Vehicles. David M. Dearing, Jackson, Mich. Filed Nov. 12, 1909. Serial No. 527,625. (Spring-and-lever suspension.) 1 claim.

1,026,858. Pneumatic Tire for Vehicle-Wheels. Louis Antoine Garchey, Paris, France. Filed June 29, 1910. Serial No. 569,601. (Block tire with air chambers in blocks.) 3 claims.

1,026,871. Internal-Combustion Engine. Simon Lake, Milford, Conn. Filed March 21, 1911. Serial No. 615,992. (Two-cycle motor with fuel injection to hot vaporizing chamber in cylinder head.) 24 claims.

1,026,889. Carburetter for Starting Internal-Combustion Engines. Frank H. Walker, Lincoln, Neb. Filed April 21, 1911. Serial No. 622,597. (Carburetter for ignition starters.) 3 claims.

1,026,893. Pneumatic Cushion for Vehicles. Fred I. Baker, Orange, Mass. Filed Nov. 17, 1911. Serial No. 90,936. (Pneumatic cylinders replacing springs.) 2 claims.

1,026,895. Radiator. Jacob B. Beam, Punxsutawney, Pa. Original application filed Feb. 16, 1911, Serial No. 608,944. Divided and this application filed July 26, 1911. Serial No. 640,656. (Radiator with independently removable sections.) 1 claim.

1,026,896. Radiator. Jacob B. Beam, Punxsutawney, Pa. Original application filed Feb. 16, 1911, Serial No. 608,944. Divided and this application filed July 26, 1911. Serial No. 640,657. (Radiator with independently removable sections.) 1 claim.

1,026,911. Rotary Explosive-Engine. Olof F. Edquist, Denver, Col. Filed April 7, 1911. Serial No. 619,521. (Rotating cylinder motor.) 16 claims.

1,027,023. Magneto. Ernest C. Wilcox, Meriden, Conn., assignor to The Connecticut Telephone & Electric Co., Meriden, Conn., a corporation of Connecticut. Filed Dec. 17, 1908. Serial No. 467,956. (Means for automatically making connections when assembling magneto.) 13 claims.

1,027,031. Hub-Odometer. Harry P. C. Browne, New York, N. Y. Filed Oct. 19, 1910. Serial No. 587,977. (Housing for hub odometer.) 2 claims.

1,027,054. Atomizer for Liquid Fuel Motors. Joseph Leflaive, St.-Etienne, France, assignor to The Societe des Moteurs Cabathe, St.-Etienne, France, a corporation of France. Filed Aug. 14, 1911. Serial No. 644,024. (Fuel feed by compressed air.) 3 claims.

1,027,056. Means for Advancing or Retarding a Magneto Shaft Relative to a Motor Shaft. Axel Levedahl, Aurora, Ill., assignor to Aurora Automatic Machinery Company, Aurora, Ill., a corporation of Illinois. Filed Sept. 2, 1910. Serial No. 580,223. (Magneto drive through gear with shifting axis.) 7 claims.

1,027,087. Starter for Internal Combustion Engines. Cornelius Van Tubbergan and Paul Westrate, Grand Rapids, Mich. Filed Feb. 17, 1912. Serial No. 678,380. (Spring starter.) 9 claims.

1,027,105. Spring Wheel. George Crawford, New York, N. Y., and Thomas Veitch, Dumont, N. J.; said Veitch assignor to said Crawford. Filed Jan. 31, 1911. Serial No. 605,675. (Helical spring concentric with hub.) 2 claims.

1,027,108. Tire Protector. William T. Dorgan, Akron, Ohio, assignor to The Standard Tire Protector Company, Akron, Ohio, a corporation of Ohio. Filed Nov. 18, 1911. Serial No. 661,184. (Rubber and fabric outer tread.) 2 claims.

1,027,130. Cushion Tire for Vehicles. Wesley S. Holmes, Ithaca, and Welcome B. Johnson, New York, N. Y., assignors to August Zinsser, Jr., trustee, New York, N. Y. Filed Feb. 18, 1910. Serial No. 544,601. (Cushion tire of rubber and spring steel.) 1 claim.

1,027,158. Wheel. Charles L. Schwarz, Philadelphia, Pa. Filed Apr. 4, 1911. Serial No. 618,835. (Wood wheel with wedge spoke fastenings.) 1 claim.

1,027,182. Rotary Internal Explosion Engine. Jens C. Christensen and Rudolf A. F. L. Anderberg, New York, N. Y. Filed Oct. 31, 1910. Serial No. 590,020. (Rotary motor with grooved-periphery rotor.) 5 claims.

1,027,196. Lamp. John H. George, Bridgeport, Conn., assignor to Hawthorne Manufacturing Company, Incorporated, Bridgeport, Conn., a corporation of Connecticue. Filed Mar. 16, 1911. Serial No. 614,783. (Reflector construction and support.) 1 claim.

1,027,247. Tire. George Gray, Sisseton, S. D. Filed Oct. 28, 1911. Serial No. 657,221. (Rubber tread with spring backing.) 1 claim.

1,027,268. Transmission Gearing. George Washington Meredith, Chicago, Ill. Filed Sept. 16, 1910. Serial No. 582,292. (Friction transmission.) 27 claims.

1,027,273. Dynamo Electric Machine. Lewis W. Nelson, Philadelphia, Pa. Filed May 16, 1910. Serial No. 561,546. (Flywheel type generator.) 3 claims.

1,027,278. Internal Combustion Engine. Harry Ralph Ricardo, London, England. Filed Nov. 11, 1910. Serial No. 591,810. (Radial cylinder motor.) 3 claims.

1,027,288. Cushioning Device for Vehicles. John C. Sherman, Brookline, Mass. Filed June 23, 1910. Serial No. 568,447. (Pneumatic cushion system.) 14 claims.

1,027,293. Connecting Rod Bearing. Alfred T. Stuart, Flint, Mich. Filed Nov. 16, 1910. Serial No. 592,729. (Eccentric adjustment for wear.) 3 claims.

1,027,306. Automobile Lamp. Percy C. Avery, Milwaukee, Wis. Filed Feb. 4, 1911. Serial No. 606,594. (Lamp with solid cast case.) 10 claims.

1,027,369. Drive Chain. Henry W. Allingham, London, England, assignor to The Morse Chain Company, Ithaca, N. Y., a corporation of New York. Filed Apr. 3, 1911. Serial No. 618,658. (Link-belt chain construction.) 7 claims.

1,027,377. Friction Clutch. William Dennis, Milwaukee, Wis., assignor, by mesne assignments, to Verges Manufacturing Co., Milwaukee, Wis., a corporation of Wisconsin. Filed May 15, 1911. Serial No. 627,179. (Cone clutch with air cushion retarding device.) 18 claims.

1,027,380. Method of Operating Internal Combustion Engines. Robert M. Fryer, New York, N. Y., assignor of one-half to Frank B. Colman, Passaic, N. J. Filed July 5, 1910. Serial No. 570,379. (Double-acting compound motor.) 5 claims.

1,062,580. Valve Gear. Amedee Bollee, Fils Le Mans, France. Filed Apr. 20, 1911. Serial No. 622,230. (Dashpot on valve-lifter.) 7 claims.

1,062,618. Attachment to Wheels. Thomas Town end, Winnipeg, Manitoba, Canada. Filed June 25, 1912. Serial No. 705,768. (Anti-side-slip device.) 2 claims.

1,062,649. Journal Bearing. Henry Hess, Wawa, Pa., assignor to The Hess-Bright Manufacturing Company, Philadelphia, Pa., a corporation of Delaware. Filed Sept. 17, 1907. Serial No. 393,322. (Bearing with double ring of balls.) 3 claims.

1,062,675. Internal Combustion Engine. William I. Wheeler, Scottville, Ill. Filed Jan. 30, 1912. Serial No. 674,334. (Sleeve-valve motor.) 3 claims.

1,062,676. Spring Wheel. Floyd H. White, Duke, Okla. Filed May 18, 1912. Serial No. 698,273. (Wheel with telescoping spoke and springs.) 2 claims.

1,062,705. Automobile Fender. Joseph Hadka, Chicago, Ill. Filed July 12, 1912. Serial No. 709,001. (Fender-supporting bracket.) 2 claims.

1,062,738. Controller Mechanism for Explosion Engines. Charles Schmidt, Cleveland, Ohio, assignor, by mesne assignments, to The Peerless Motor Car Company, Cleveland, Ohio, a corporation of Ohio. Filed Oct. 6, 1906. Serial No. 337,695. (Timer running in oil.) 3 claims.

1,062,758. Shock Absorber. Guy L. Bayley, Berkeley, Cal. Filed Oct. 26, 1911. Serial No. 656,839. (Pneumatic shock absorber.) 4 claims.

1,062,789. Motor Vehicle Frame. Walter S. Morton, Harrisburg, Pa. Filed Mar. 5, 1912. Serial No. 681,862. (Flexible frame construction.) 10 claims.

1,062,833. Dirigible Headlight. Louis Marcel Gabriel Lourdin, Paris, France. Filed Feb. 23, 1912. Serial No. 679,436. (Means for manually controlling headlight direction.) 3 claims.

1,062,842. Headlight for Automobiles. William J. Mitchell and Milton W. Atkins, Ridgeway, Va. Filed June 26, 1912. Serial No. 706,036. (Headlight moving with steering gear.) 1 claim.

1,062,872. Vehicle Spring. Leonidas L. Abbot, Little Rock, Ark. Filed Sept. 24, 1912. Serial No. 722,043. (Elliptic spring with auxiliary coil spring and friction device.) 3 claims.

1,062,876. Automobile Transmission. Lafayette W. Blymer, Los Angeles, Cal. Filed Oct. 31, 1911. Serial No. 657,734. (Hydraulic transmission system.) 9 claims.

1,062,887. Truck. William C. Carr, Buffalo, N. Y. Filed Apr. 24, 1912. Serial No. 692,817. (Industrial or warehouse truck.) 6 claims.

1,062,898. Automobile. Fred Drew, Boston, Mass. Filed Dec. 9, 1912. Serial No. 725,674. (Cover for space between front and rear seats of car.) 2 claims.

1,062,934. Power Transmission Mechanism. Clarence W. Taylor, Chicago, Ill., assignor to Agnes Poage Taylor, Chicago, Ill. Filed Nov. 4, 1912. Serial No. 729,208. (Individual clutch bevel gear change-speed system.) 9 claims.

1,062,985. Power Transmission Mechanism. Carl J. Mellin, Schenectady, N. Y. Filed May 15, 1912. Serial No. 697,378. (Friction transmission.) 14 claims.

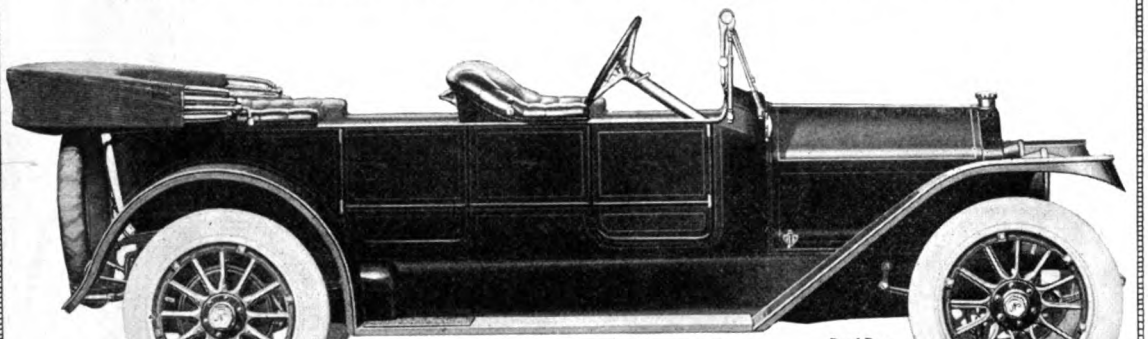
1,062,999. Gas Engine. Samuel J. Webb, deceased, Minden, La.; Robert D. Webb, Minden, La., by inheritance and by mesne assignments, owner of entire title. Filed Oct. 30, 1912. Serial No. 729,428. (Motor with separate compression cylinder.) 4 claims.

1,063,001. Differential Gearing. Herbert W. Alden, Detroit, Mich., assignor to The Timken-Detroit Axle Company, Detroit, Mich., a corporation of Ohio. Filed Sept. 7, 1912. Serial No. 719,241. (Differential lock interlocked with clutch.) 5 claims.

1,063,003. Automobile. Daniel N. Baxter, Wichita, Kans., assignor to Daniel N. Baxter, trustee, Wichita, Kans. Filed July 7, 1909. Serial No. 506,382. (Jointed frame system.) 2 claims.

1,063,008. Vehicle Tire. William E. Budd, Elizabeth, N. J. Filed Mar. 15, 1912. Serial No. 754,619. (Pneumatic tire with overlapping edges at rim.) 6 claims.

1,063,040. Motor Suspension and Drive. Harold H. Kennedy, Indianapolis, Ind., assignor to The Waverley Company, Indianapolis, Ind., a corporation of Indiana. Filed June 28, 1911. Serial No. 635,893. (Drive system and suspension for electric vehicle motors.) 4 claims.



1,063,082. Valve Mechanism for Internal Combustion Engines. William R. Thomas, Sr., and William R. Thomas, Jr., Catasauqua, Pa.; said Thomas, Sr., assignor to said Thomas, Jr. Filed June 24, 1912. Serial No. 705,606. (Motor with superimposed valves in cylinder head.) 2 claims.

1,063,090. License Tag Holder. William L. Weidler, Camden, N. J. Filed Dec. 12, 1912. Serial No. 736,279. (Lncense holder with spring retaining device.) 2 claims.

National

WORLD'S CHAMPION

New Series V-3—Immediate Delivery

Desert Race Winner, 1911, 551 miles

Stock Champion, Elgin, 1911, 305.03 miles

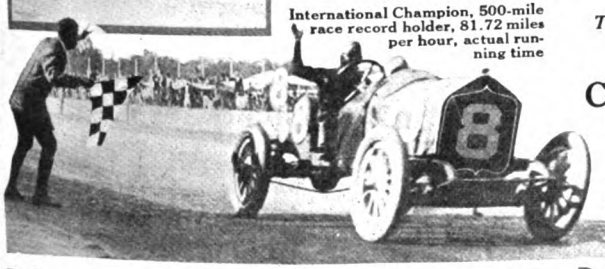
Fastest Mile for Stock Cars, average 89.28 miles per hour

Road Race Champion for Class C, 301-450, Santa Monica, 74.42 m. p. h.

Free-for-All Road Race Champion, 1911, 202.008 mi., av. 74.628 m. p. h.

Why not *you* own the champion?

There can be but *one* leader. It *is* the *National*. Not once, but year after year it remains supreme—unconquered! Records, demonstrations and actual performances prove this.



A ride today in a National will prove to you how this is possible, despite desperate efforts of the costly foreign cars to wrest laurels from America's defender—the *National*.

The *National's* championship quality is bred into its very fibre and strength. Its power is indefatigable and its control marvelously simple. There is a pride in ownership of the one, absolute leader.

Dignified in appearance, quiet in operation, comfortable and luxurious, the *National* is complete in everything from electric self-starter to concealed baggage compartments.

Five models, $2750 to $3400

International Champion, 500-mile race record holder, 81.72 miles per hour, actual running time

Thirteen years' experience

Champion on Speedway or Broadway

TUTO HORN

$15

LOOK FOR
Elyria-Dean
TRADE MARK
WHERE QUALITY'S SEEN

In the manufacturing of Elyria-Dean electrical products we doubly fortify our distributors with a salable accessory for which the demand is already created, and through our advertising and sales making campaign we place Elyria-Dean distributors in direct touch with automobile owners everywhere.

TUTO HORN

The ideal warning signal for all cars, formerly selling at $25 and now listing at $15.

The TUTO HORN is a distinctly TWO-TONE signal in all that the name implies. It performs every function of a warning signal intelligently and unfailingly.

Ordinary pressure on push button instantly sends forth an adequate danger warning which is sufficient nine times in ten. With other electric signals it is necessary to give minimum or maximum warning regardless of the conditions ahead.

To meet unusual conditions you simply press the push button way down and secure the harsh, abrupt car-coming warning which will instantly clear the road under any traffic conditions.

REXO HORN

$8

LOOK FOR
Elyria-Dean
TRADE MARK
WHERE QUALITY'S SEEN

In all things electrical the name Elyria-Dean carries a known guarantee of goodness and efficiency that is a valuable selling asset in competition. During the past year we made and delivered over 50,000 TUTO and REXO HORNS. During the coming twelve months we will outsell any other make or type of warning signal two to one.

REXO HORN

The big-little signal for medium and low priced cars. Built, tested and guaranteed to the Elyria-Dean standard and selling at $8. ready to attach.

The REXO HORN is at once the lowest priced high quality electrical warning signal in the world.

The construction, workmanship and finish is equal to any warning signal regardless of price. The warning signal delivered is fully adequate to meet any driving condition.

Elyria-Dean distributors everywhere endorse and recommend this REXO HORN. It's the one electric signal that will outsell any other make on price, efficiency or guarantee.

Our new selling campaign is now under way. We are sending the Elyria-Dean story to car owners wherever cars are sold. Wide-awake dealers will enjoy a profitable Fall business by adding our line of warning signals. Our selling campaign and the new Agency agreement will be sent to responsible dealers on request. Let us add your name to our mailing list. Our campaign will help you very materially to secure the accessory business in your territory.

DEFENSE or TRIBUTE

Part Two

In the early part of the nineteenth century the Americans, although a young nation, gave strong proof of their practical business sense. For years the Mediterranean had been infested by Tripolitan pirates. Almost every European nation had for years paid tribute to these pirates to indemnify their commerce. This tribute, however promptly paid, only insured partial protection and for a short time at the best.

The young American nation was more practical. They applied a remedy in the shape of a fleet of warships, which soundly thrashed the Tripolitans. However strenuous the remedy, it was effective. It put a stop once and for all to the trouble from which our commerce suffered. No one knows how long we either would have had to pay tribute or suffer the trouble had not a final and adequate remedy been administered at once.

Just so with carburetor trouble. Why suffer the expense and inconvenience when a permanent and lasting remedy is at your command which will eliminate the impurities in gasolene and by taking away the cause of carburetor trouble, do away with such trouble entirely. It's the only way. Any other relief is only temporary. It is tribute. It is not tribute to any lack of skill on the part of the carburetor manufacturers. They have done the best they can and probably carburetors are as nearly perfect as any other part of a car's make-up. It is tribute to a misunderstanding of what is called carburetor trouble. The only thing to do is to apply the remedy to the seat of the trouble. Filter the impurities from gasolene and 90% of carburetor troubles will stop. The Ellis Gasolene Purifier accomplishes the work better than anything ever devised. It costs $3.50 and its defense against carburetor trouble is effective and lasting. How does this amount compare with the amount each car owner pays as tribute to "carburetor trouble"?

The Ellis Gasolene Purifier

is simple and positive in its working. It is easy to attach and requires no more attention than draining once every week or so. Inasmuch as the impurities in gasolene are generally fine particles of paraffine, sediment, dirt, grit, water, etc., the series of screens and filters in the Purifier effectively intercept them and prevent their reaching the carburetor. Water, always present, is trapped by gravity in the chamber on the lower side of the Purifier. It is guaranteed efficient. Its cost is $3.50 and it can be installed on the fuel feed pipe of any car in half an hour. When ordering state the outside diameter of the feed pipe.

Dealers will find this one of the best and easiest selling accessories on the market. Write for full particulars

The National Sales Co., 45 Milk Street, Boston, Mass.

If every motorist could distinguish "perfection of recording mechanism" as readily as a high grade watch maker, there would be only one speedometer choice---THE CORBIN-BROWN.

Built With the Accuracy and Precision of a High Grade Watch

There are all grades of speedometers just as there are all grades of watches.

And like watches, they afford a service in keeping with the manner in which they have been made.

The mere fact that an instrument bears the name of "Speedometer" is not enough!

You should demand more — perfection of mechanism—the accuracy and precision of a high grade watch!

If you do, your choice will be the

CORBIN-BROWN SPEEDOMETER

"The Speedometer of Absolute Accuracy"

Its entire mechanism is extremely simple—practically consisting in its entirety of compound governors.

These are thoroughly sensitive to the speed of the wheel.

The principle is centrifugal—proved by science to be unaffected by electrical influence and atmospheric changes.

Every Corbin-Brown Speedometer is built of specially hardened steel and brass. **THERE ARE ABSOLUTELY NO DIE-CAST PARTS.**

Not a single Corbin-Brown is ever sent out before first being calibrated by hand and tested to absolute accuracy.

Its indicator is steady.

Its odometer records a total of 100,000 miles.

Specify the Corbin-Brown for your 1914 equipment!

We have been preaching that concerns who have devoted their entire energies and time to the production of a certain unit of automobile construction achieve better results than the concerns which try to make everything. We have applied this theory to our own specialty, and with the best of results.

WE have for years specialized on the production of motors, for automobiles and for motor trucks.

In producing Ergon motors we have found that we could obtain certain motor parts from motor parts specialists to better advantage than we could hope to make them ourselves. As an instance; no better crank shaft forgings are made than those the Driggs-Seabury Ordinance Corporation of Sharon, Pa., supply us with for use in Ergon Motors.

Another instance, when we decided to replace timing gears with silent chain drive, we selected the Renold Silent Chain as the best for the purpose. It is a better chain than we could hope to produce. The excellence of such motor parts as are made for us by specialists in these various lines has helped to make the remarkable efficiency of Ergon Motors possible.

Ergon Motors, Standard Sizes

Model C, . . .	3¾ x 4½
Model CX, . . .	4 x 4½
Model D, . . .	4⅜ x 6

It is a long story but wonderfully interesting to all to whom the motor question is vital. If interested write us. We will be glad to go into all details with you.

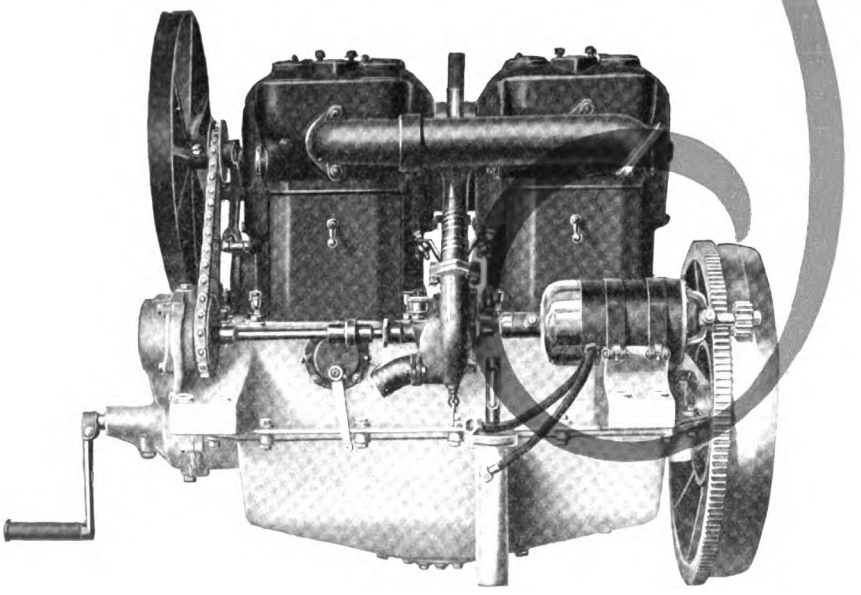
WE ANNOUNCE

Weight
30 Pounds Without Switch

Diameter
5 Inches

a new Rushmore Starter similar in design, automatic action and power to the Rushmore Model B, but weighing only two-thirds as much.



RUSHMORE STARTER
MODEL C

Normal Speed
1200 R. P. M.

Maximum H. P.
11-5 at 450 R. P. M.

The Model C operates on exactly the same system as the Models A and B. It gears directly to the flywheel, and utilizes end play of the armature to engage and disengage the pinion automatically at the proper times. It is new only in the extraordinary power delivered for its size and weight.

Rushmore Dynamo Works, Plainfield, New Jersey

Spins engine 25% to 60% faster than any other starter taking same battery current.

Weight, 30 lbs. without switch.

Diameter, 5 inches.

Normal speed, 1200 r.p.m.

Maximum h.p., 1⅕ at 450 r.p.m.

Model C Rushmore Starter on the Simplex 38 h.p. engine (bore 4⅞ in., stroke 6½ in.).

Taking 90 amperes at 5.6 volts, this Starter spins the engine at 100 r.p.m. Gear ratio, 12 to 1.

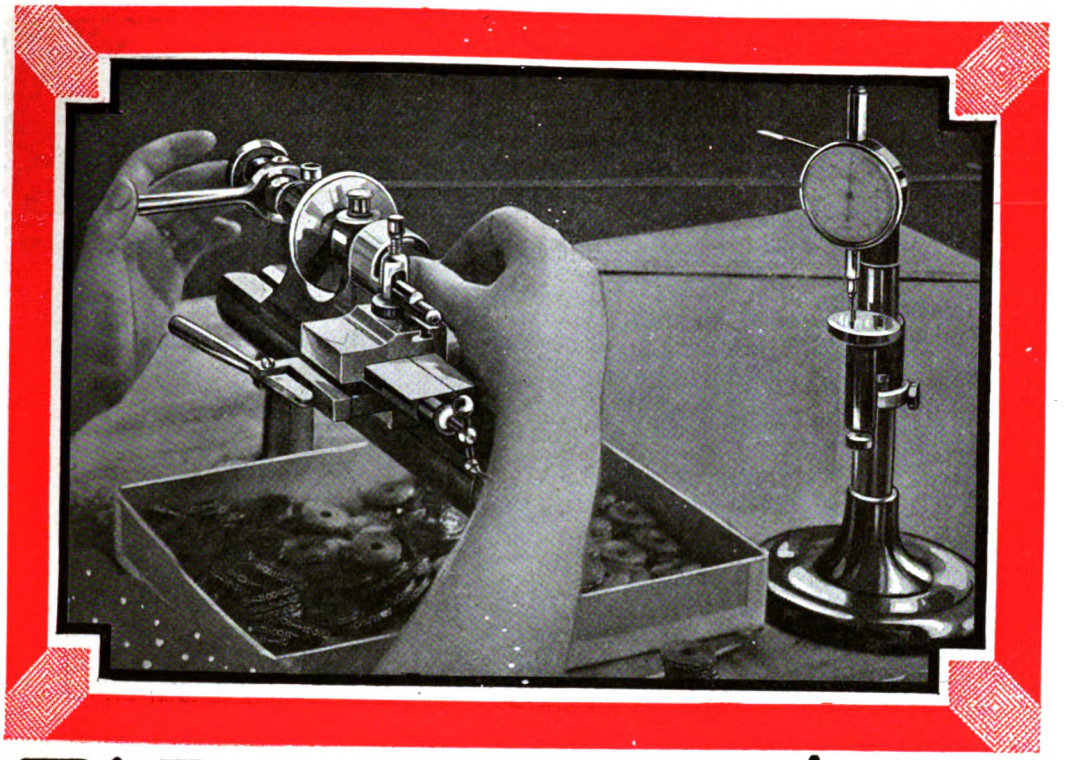
Ambesco

FROM MINE TO BRAKE BAND

AMBESCO is a superior brake lining as well as a less expensive brake lining because it is manufactured from the crude mineral into the finished product right here within our walls. Most other brake linings are made from raw material purchased from ourselves or similar manufacturing concerns by what the trade terms brake lining jobbers. In other words, such a concern will buy the asbestos yarn or the untreated asbestos tape in quantities from asbestos manufacturers, treat and stamp it with their own trade-mark and put it upon the market. Under such conditions, the brake lining is not always uniform for it frequently is the product of tape or yarn woven upon different looms and coming from different concerns.



AMBESCO, however, is our own product. manufactured from the most select stock that we can mine, and produced under the most exacting inspection to insure absolute uniformity of the strands of both asbestos and brass wire. It is obvious that if there is even a slight variation in the diameter of the strands which go to make up the finished brake lining, the strands which are larger will wear out before those which are smaller. In other words, if half the strands are large and half are small, in effect your brake lining is only about half as strong as it should be. For only the large half of the strands are offering efficient service until they are worn down to the size of the smaller strands, when your whole surface takes hold as it should. But by this time you will have lost a considerable portion of your large strands and consequently the fabric as a whole is weakened

By manufacturing AMBESCO direct from the mine to the finished product, therefore, we not only are able to supply the trade with a superior product from a standpoint of efficiency but by eliminating the middle profit that is essential to any other method of operating, we are able to give the trade a far better price than is obtainable elsewhere for the same quality product.

The American Asbestos Co., Norristown, Penn.

Watch our advertisements for an important announcement to dealers and jobbers---a plan whereby you can have a complete stock of AMBESCO without tying up a lot of money

WARNER

QUALITY AUTO-METER

■ ■ ■

Skilled Hands and Black Diamonds

HAVE you ever wondered at the unfailing accuracy with which the Warner Auto-Meter records every turn of the wheel for hundreds of thousands of miles? Such absolute accuracy is only obtainable by our high-priced manufacturing methods.

Take for example the machine for making the little dial that makes up the odometer.

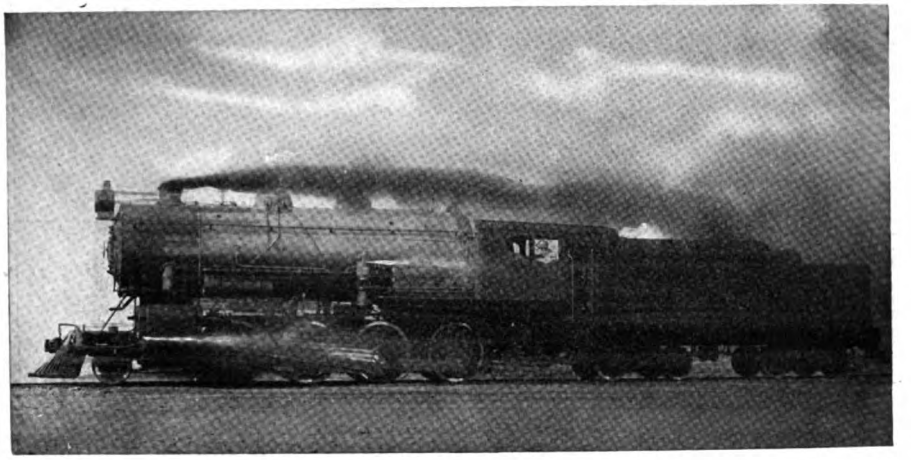
On this machine are prepared the odometer discs which we import from Europe. Each disc is accurately "tailored" with a black diamond cutting point. Only the most skilled hands are engaged at this task.

We use a tool with a black diamond cutting point because it is the only one thus far discovered which will mold the exceedingly hard, durable and lasting substance.

This operation is performed on delicate watchmakers' lathes.

At the right of this picture is a gauge used to measure the thickness of the dials to 1-10,000th of an inch. Each must measure absolutely accurate in every detail.

Throughout every detail of their manufacture, this same minute care is given each Warner Auto-Meter.



You can have a Warner on the car you buy if you ask for it.

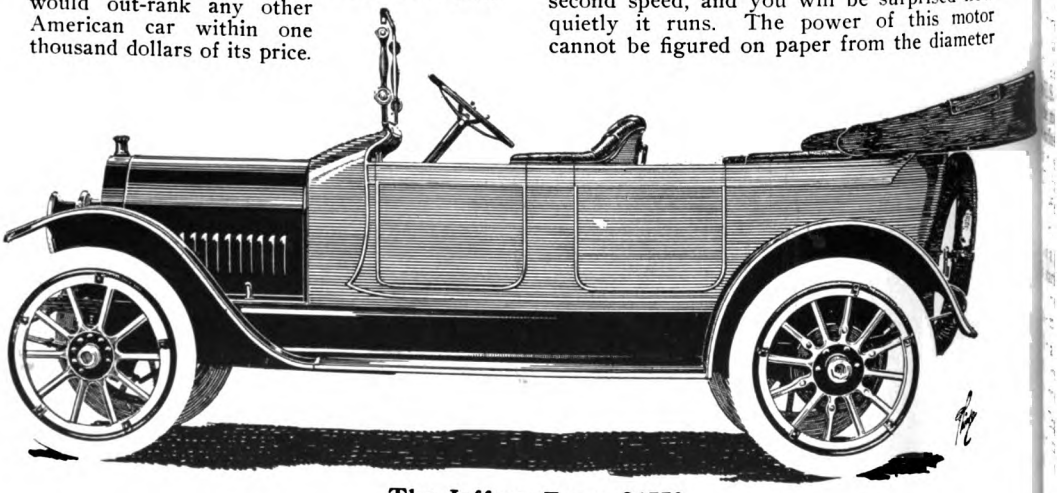
From Nothing to Forty Miles an Hour In Twenty Seconds

The Jeffery Four is an absolutely new car, so modern and so superior that it can rub shoulders with the best cars the world produces, and profit by comparison. It is a strictly high grade car, built in accordance with the latest European and American practice, but sold at an extremely low figure—$1550.

One big motor car dealer said when he saw it, "It can't be done. You can't build a car like that to sell for $1550—it's too good." We proved to him that it could be done by a manufacturer with the experience, capital and equipment. Three days later he wired us an order for eight hundred cars.

The astonishing story of this car is really the story of a great independent factory backed by forty years of manufacturing experience and five and one-half million dollars in assets.



Two things we determined to give to this car without sacrificing a third. We knew that if we could accomplish these two things without losing the third, we would have a car that would out-rank any other American car within one thousand dollars of its price.

We gave it light weight and light running qualities without sacrificing comfort. Think what these things mean—less fuel consumption, less vibration, less repairs, less tire expense and real pleasure for the owner.

We began with the motor. Jeffery engineers took to pieces every successful European and American motor before deciding upon this high speed, mono-bloc design. From all these we took the best features, combined them with our own ideas and the result is a remarkable motor—powerful, light and economical.

This high speed, mono-bloc motor is compact and simple. It develops, at 2200 revolutions per minute, forty horse power. The cylinders, 3¾ inch bore and 5¼ inch stroke, are formed in one remarkable solid casting, together with the valve seats and water jackets. This makes it strong, without vibration and easy to cool.

It can travel forty miles per hour on second speed, and you will be surprised how quietly it runs. The power of this motor cannot be figured on paper from the diameter

The Jeffery Four, $1550

Digitized by Google

of the cylinder or the length of the piston stroke. It takes motor speed to make power and, when delivered to the rear axle through mechanism which is almost entirely free from friction, the result is wonderful.

The reciprocating parts of the motor are made as light as possible, consistent with strength. The pistons, together with the wrist pins and piston rings, weigh but three pounds each. Usually pistons weigh from four and one-half to seven pounds each.

This motor gets away with snap and go—the kind you like to feel. Touch the throttle and in seven seconds you are making twenty miles an hour, in twenty seconds forty miles an hour—fifty miles per hour in fifty-five seconds.

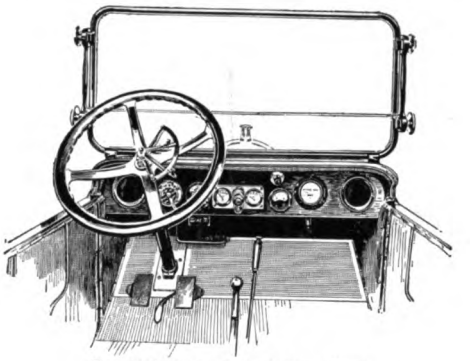
The oiling system is the latest. It is a combination of the internal force feed and constant level splash systems. A reservoir under the crank case contains the supply of oil.

Direct front view of Jeffery Four

The oil pressure gauge on the dash, or the indicators on the crank case, will tell you instantly what is going on.

The electric starting and lighting system is the U. S. L. All manufacturers know that this is the most expensive made and is protected by exclusive patents. We know by experience that it is the best. Another car selling for $3250 charges $200 extra for this equipment. The Jeffery car could be sold for $100 less if equipped in any other way.

Not a gear, cam, chain or bearing is used in this starter's construction—that's what makes it so quiet. None of that grinding noise you notice in the common starter.

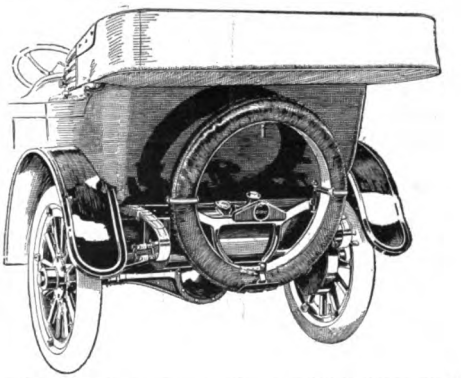


Not a single car in America selling under two thousand dollars, except the Jeffery Four, is equipped with the U. S. L.

An English motor car manufacturer investigating starters in this country said in *The Autocar*, the leading English motoring publication, that in two years the gear driven starter would be obsolete.

The clutch is a perfected cone, leather faced with spring inserts.

Every mechanic knows the effectiveness and simplicity of this type.



Between the clutch and the four speed transmission there is a feature absolutely new to American cars—the famous Daimler flexible leather coupling. Daimler introduced it first in his large omnibuses in use throughout Europe. We tested it for thousands of miles before adopting it on the Jeffery car.

Forward dash of the Jeffery Four
All attachments set in

The transmission with four speeds forward and one reverse, weighs less than one hundred pounds. It's the last word in flexibility of control and ease of operation.

The transmission case is solidly bolted to two cross members of the frame and located amidships, providing center control and left hand steer, thus conforming to that greatest influence—public opinion.

Rear of Jeffery Four. Pressure Gasoline Tank rigidly attached to extended frame members

The Thomas B. Jeffery Company

Jeffery

Kenosha, Wis. U.S.A.

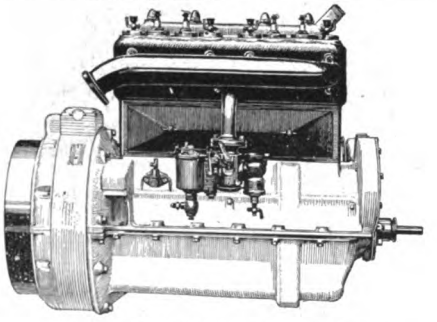
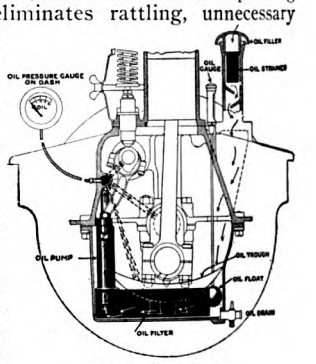
The transmission shafts are of vanadium steel hung in five imported annular ball bearings.



We are proud of our transmission gears. We make them ourselves and the fifty-two tooth bevel gear is, beyond question, the most correctly cut gear in America today.

Ask any mechanic about Spicer universal joints. Two of these are located between the transmission and the rear axle. The drive shaft is many times stronger than the heaviest strain you could ever place upon it. Made of the finest chrome nickel steel, heat treated, it is the most expensive we can buy. These joints are fully housed, light, well lubricated and durable.

U. S. L. starting and lighting system directly connected. No chains, gears or belts



The rear axle is of full floating type, fitted with imported annular ball bearings—the same quality axle as those used on all highest priced electric vehicles. Few American built gasoline cars have been able to adopt them on account of their cost. Consider, if you can, the frictionless passage of power from the high speed, well balanced motor through the leather coupling, into the four speed transmission, rolling smoothly on imported annular ball bearings, and back through the Spicer universal joints to this remarkable axle.

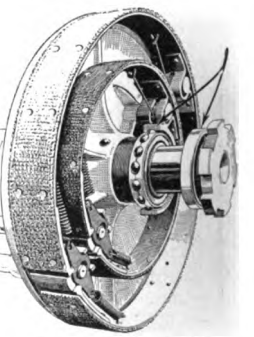
Jeffery Four high speed mono-bloc motor

What is the result? You can speed up this car to forty miles per hour, shut off the motor and coast half a mile. The mere pressure of forty-five pounds will start it rolling on the floor. Not a ball bearing in it that has not been submitted to at least three engineers for an opinion as to size. Light running—of course—economy again, you see.

There are two brakes—a service, and an emergency brake, each of internal expanding type. This eliminates rattling, unnecessary parts, and keeps them free from dust, grit and mud.

Jeffery oiling system

Owing to compactness, we have been able to reduce the wheel base to 116 inches, yet we have retained the comfortable lines of the body, cutting out weight and again reducing upkeep.

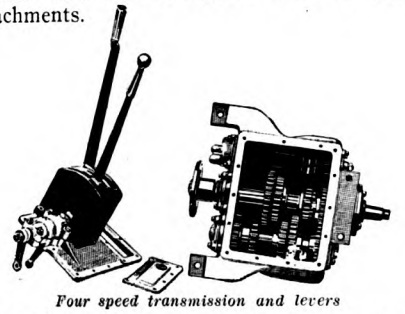


For this wheel base we have provided 34x4 inch wheels, equipped with demountable rims. Short turning space is provided. The Jeffery Four will turn in a forty-two foot circle.

The springs are of vanadium steel, two inches wide and fifty inches long, scientifically heat treated. We use vanadium steel because of its longer life and greater elasticity.

The front axle of vanadium steel is a marvel of lightness and strength. It weighs but twenty-nine pounds, but it took thirty-two thousand pounds to twist it in our torsion test machine. The radiator holds five and one-half gallons of water and has over ten thousand square inches of cooling surface. Circulation is by centrifugal pump.

Rothschild designed the body. It's an improvement on the Lancia—that beautiful Italian car. It is Brewster green in color.

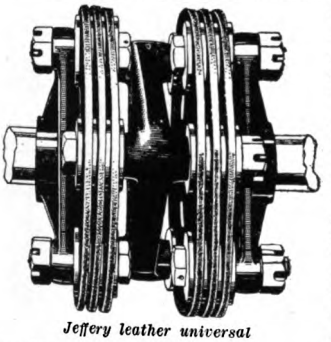


If we did not have a press of fifteen hundred tons capacity we could not manufacture this body and put it on a car at $1550. Sixteen dies were used in making the body alone, and the die for the cowl took three months to build.

Jeffery Four brakes showing imported annular ball bearings

Digitized by Google

The upholstery is of the finest leather and hair. The doors are extremely wide, 23½ inches. The dash is replete with all modern attachments.



Four speed transmission and levers

The hinges on the door are of the patented invisible type. The back of the front seat is finished in the finest leather.

A pressure-feed gasoline tank with gauge carried behind, and with pump operated from the cam shaft, insures an even flow up hill or down. An auxiliary pressure pump is located on the dash, both for oil and air emergency.

The electric light switch attachment is the most clever arrangement of its kind yet devised. The lights can be dimmed at any time for city driving. The equipment includes top of finest material, rain vision wind shield, Stewart-Warner speedometer, ammeter, extra demountable rim with brackets, electrically lighted dash, Klaxet horn, Solar electric lamps and complete tool equipment. Power tire pump, $25 extra.

Jeffery leather universal

The Jeffery Six

The Jeffery Six is a duplicate of the wonderful Jeffery Four, except for size, and the fact that the cylinders are cast in pairs.

This car, which sells at $2250, has all the best features of all the best cars. We built it for the man who demands Jeffery quality in a six.

It is light—actual scale weight 3700 pounds—with full equipment. We made it luxurious without making it extravagant.

It is a beautiful car and a delight to drive. It is smooth, flexible and responsive. We know that a better Six cannot be built for the simple reason that parts of better quality have yet to be produced.

High Grade Features of Jeffery Six

Forty-eight horse power motor, cylinders cast in pairs, 3¾x5¼.

Extra large bearings.

Bosch Duplex ignition.

Rayfield carburetor.

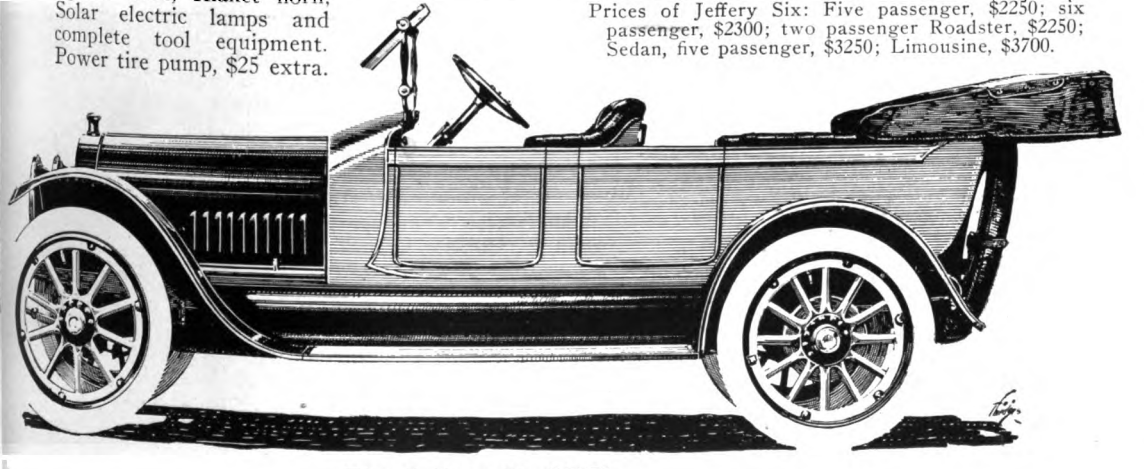
Imported annular ball bearings throughout.

Four forward speed transmission.

Warner auto meter.

U. S. L. starting and lighting system.

Power tire pump.



Wheels and tires 36 x 4½. Sedan and Limousine 37 x 5 inch tires. Wheel base 128 inches. Demountable rims.

Rothschild body with extra wide doors and low, deep seats.

Pressure feed gasoline tank with gauge.

Full floating rear axle.

Prices of Jeffery Six: Five passenger, $2250; six passenger, $2300; two passenger Roadster, $2250; Sedan, five passenger, $3250; Limousine, $3700.

The Jeffery Six $2250

Fifteen Jeffery Four Features

High speed mono-bloc motor, European type. From nothing to forty miles an hour in twenty seconds—high grade.

U. S. L. starting and lighting system—high grade. This car could be sold for $100 less if equipped in any other way.

Imported annular ball bearings throughout—high grade. Standard on the world's best cars.

Spicer universal joints—high grade. Ask any mechanic.

Combination force feed and splash oiling system—high grade. The most economical we know.

Four forward speed transmission—high grade. Control levers directly over transmission.

Full floating type rear axle on imported annular ball bearings—high grade. Same quality as that used on all highest priced electric vehicles.

Body designed by Rothschild of New York—high grade. The hit of the Paris show.

Leather universal between clutch and transmission—high grade.

Vanadium steel springs and front axle—high grade.

Rayfield carburetor—high grade.

Left drive and center control—high grade.

Pressure feed gasoline tank in rear, and pump operated through cam shaft—high grade.

Bosch Duplex ignition—high grade.

Solar Lamps—high grade. Operated by four-position switch—the simplest ever made.

Prices of Jeffery Four

Built in five body styles. Five passenger touring, $1550. Two passenger roadster, $1550. Two passenger Coupelette, enclosed, inside drive, $1950. Four passenger Sedan, enclosed, inside drive, $2350. Five passenger limousine, $3000.

Dealers have already ordered over fifty per cent of our output.

Five and one-half million dollars in assets, with the highest credit in the industry, and a factory equipped with three million dollars' worth of the latest machinery, and manned by a loyal body of workmen, are the things that made the Jeffery Four and Six possible.

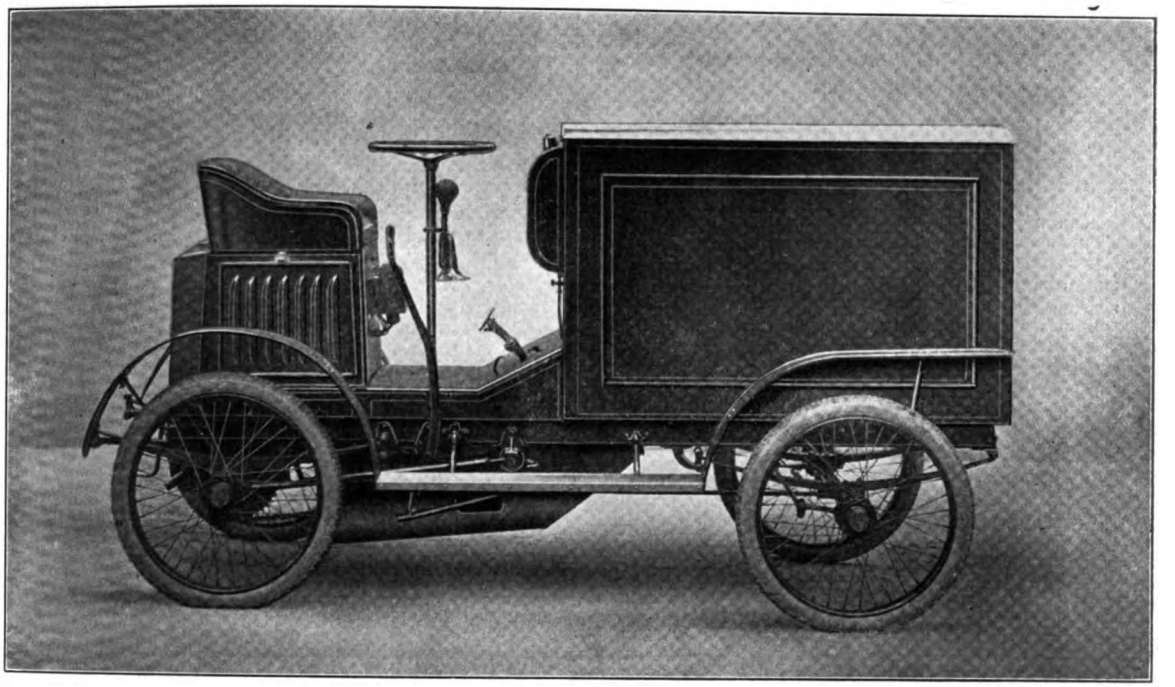
Few manufacturers in the industry can produce a car like the Jeffery Four to sell for $1550, and make a cent of profit—except Jeffery.

True, the margin will be small, but the sales will be enormous and the quantity production large. We will be satisfied with the profit because the owner will be satisfied with his car.

Although this is the first public announcement of the Jeffery Four and Six, dealers have already ordered more than fifty per cent of our output for the coming year. One dealer, recognized as the leader in his section of the country, when he heard of the new cars, traveled fifteen hundred miles to ask for the right to sell them.

Big dealers in big cities all over the country are dropping other lines or organizing new companies to take on the Jeffery line. They were quick to recognize in this car a wonderful opportunity. They know that only a concern with the capital, equipment and experience of the Jeffery Company can produce such a car at such a price.

Deliveries have already begun and the output is increasing daily. The orders for immediate delivery have reached a high figure, but the factory can handle the demand.



Successful dealers want to become associated with a financially strong and successful organization.

Wire or write immediately for territorial reservations.

A BAD WEATHER CAR

THE

MOTOKART

The MOTOKART is not a seasonable car, not a car selling only during Spring months, as in the case of pleasure vehicles, but throughout the year. Your Grocer, Butcher, Baker or Dry Goods Man will tell you that as bad weather approaches the call for delivery increases many fold, buyers who ordinarily carry away their merchandise demand that goods be sent home in rainy weather, and this demand increases until its culmination during the Holiday Season, when the delivery service of every store is taxed to its utmost capacity. Now is the time to talk MOTOKARTS, to start the entering wedge with merchants in your town. We still have considerable territory open for negotiation with reliable, energetic dealers.

SPECIFICATIONS

Engine: Two Cylinder, Four Cycle, 3⅝ x 4, Water Cooled.

No Other "Six" in the World Near this Price

The new Studebaker "Six" stands absolutely alone and apart in the entire field of six-cylinder cars.

At its price of $1575—less by hundreds than any other "Six"—it confers the operative advantages of the "Six" emphasized and enhanced because this "SIX" is a Studebaker-manufactured "SIX."

It affords passenger capacity for seven.

It brings the manifest advantages of electric lighting and starting through a two-unit system that has proved itself on thousands of Studebaker cars.

Never before has such a car been offered at $1575.

Today there is not such another car, at this price, in the entire world.

Six Thousand Manufacturing Operations

How completely the Studebaker "SIX" is the product of the great Studebaker plants you will realize when you know that its construction requires more than 6,000 manufacturing operations.

Throughout the rear axle and transmission, and in the front wheels we use 13 Timken roller bearings for quiet, easy running.

In fuel consumption we believe the "SIX" will match, if not surpass, the economy of any car of equal horsepower. Its motor size is 3½ x 5 inches.

It is economical because, in spite of its 121-inch wheelbase it is light, and easy on its 34 x 4 inch tires; yet it is wonderfully strong.

Carries Seven in Comfort

It is generously roomy and richly upholstered, and carries its seven passengers in utmost comfort.

In design and line, the "SIX" acknowledges no greater beauty and grace.

The starting and lighting system is the Wagner two-unit, starting motor and generator separate.

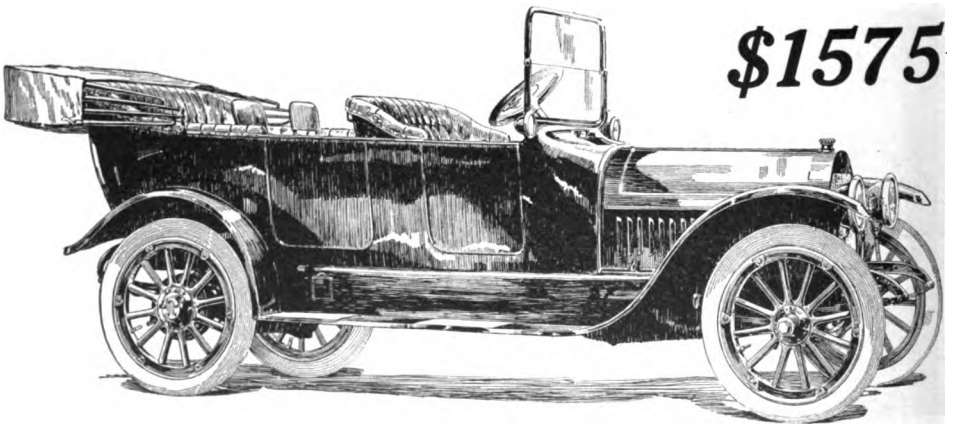
Lamps are Gray & Davis's highest quality, parabolic type.

In short, the "SIX" lacks nothing in style beauty or comfort.

Studebaker

Electrically Started
Electrically Lighted
Seven-Passenger

A "Six" That Has a Field All to Itself



The superb new Studebaker "SIX" is a manufactured "Six" down to the smallest essential detail.

Any other kind of a "six" we decline to consider in comparison.

In a "six" you must have manufactured accuracy—every "six" part must synchronize with every other part.

And—even so—there is no other "six," either assembled or manufactured, which is even near the Studebaker "SIX" in price.

Studebaker, Detroit, Mich.

$1575

"4" Studebaker

Electrically Started
Electrically Lighted
Five-Passenger

Try to Find Another "Four" Like This

We hold fast to our positive convictions concerning this new Studebaker "Four."

We are convinced, to begin with, that you will not find another "four" which compares with it in value.

We are convinced that it will eventually compel those above it in price to give more; and those below it, to charge less.

We believe it will cause more changes in ownership among those who have waited for a higher quality to be brought down to this price than any "four" which has preceded it.

Studebaker, Detroit, Mich.

This "Four" the Final Word Among Four-Cylinder Cars

This Studebaker "FOUR" has been developed from our experience in building 110,000 "FOURS."

Its price, $1050, represents the outside limit of price for a "Four," because no "Four" can give more, in actual value or performance, than this one does.

So its price is right. Its capacity is right. Its power is right. It is the right type—the last word among four-cylinder cars.

Thirteen Timken Bearings

Nothing that we can say here will give you an adequate idea of the power possibilities of this car—or of the things of which it is actually capable.

The long-stroke motor presents the latest approved engineering practice—cylinders cast en bloc, valves enclosed, exhaust and intake manifolds integral.

Thirteen Timken bearings reduce friction and wear to the minimum at every point in the transmission and rear axle in front wheel hubs.

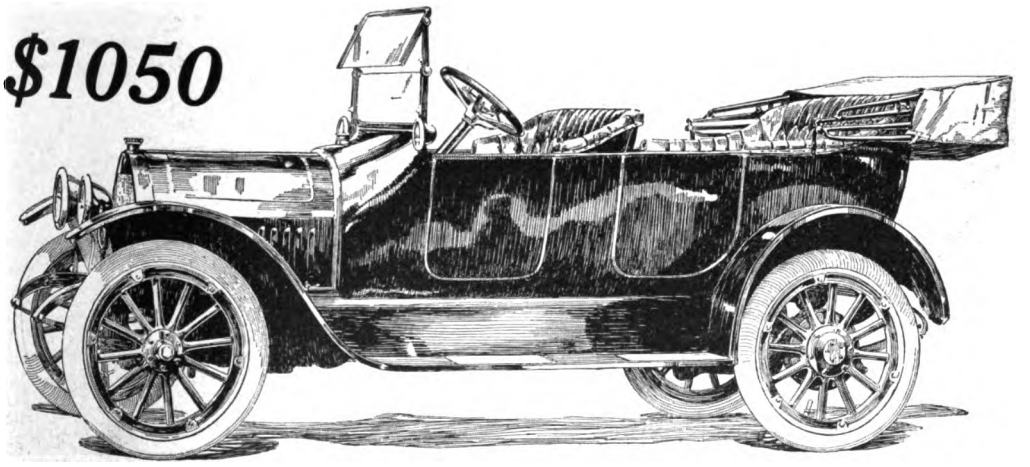
Its rear axle is of the full-floating type, and completely accessible.

The rear springs are full elliptic, very long and easy, and with the lower member suspended beneath the axle.

Electric Lighting and Starting

It has left hand steering and central control.

The electrical starting and lighting equipment is the Wagner two-unit system.



Headlights are Gray & Davis's best quality parabolic lamps.

The windshield is of new design, ventilating, clear vision and rain vision.

Rims are detachable demountable, with one extra rim and tire carriers at the rear.

Electric horn, robe rail, and tool box are also furnished with the "four."

$1050

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.

The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.

The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.

"American" Axles

An Ideal Mounting for That Form of Worm Drive Which Has Been Universally Accorded First Place

In every field of industry there is one acknowledged leader, by which all others of its type are judged.

The Lanchester-Daimler Worm Drive holds this enviable position among gears of its class, because its superior efficiency is not a mere claim, but the verdict of expert engineers, based upon exhaustive practical tests covering many years of service.

Since we secured the sole American rights as axle manufacturers to this gear—some two years ago—we have actually added to the wonderful efficiency which it displayed abroad, through the perfection of mounting which "American" Axles have given it.

By offering manufacturers of high grade gasoline or electric pleasure cars the option of the Lanchester-Daimler Worm Drive, or our own Bevel Drive Axle, we doubled our opportunity for service just when the worm drive became the most important subject connected with automobile construction.

The Lanchester-Daimler Worm Drive, mounted in a full-floating "American" Axle and fitted throughout with the finest of foreign made ball-bearings is, therefore, a unit whose every part has been conclusively tested, and which in its complete form is, we believe, the best axle of its class in the world.

The adjusting and full-floating features of American Axles are fully covered by our own patents and by shop rights from other patentees.

THE AMERICAN BALL-BEARING COMPANY, Cleveland, Ohio

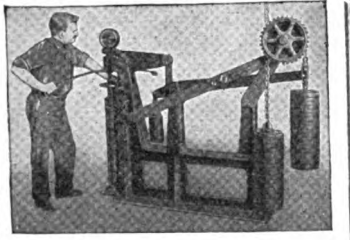
Know These Springs By This Trade Mark

RESILIENT Detroit Springs

Look for the Lubricating Cup near End of Each Leaf

SILENT = SELF-LUBRICATING

The *Extra* Quality of Detroit Springs *pays.* It pays *us*—in steadily increasing good will on the part of the motoring public and car manufacturers. It pays the *car manufacturer* in the reputation it gives his car for easy riding. It pays the *motorist* in comfort, in safety.



Extra quality pays. More than that, we do not exaggerate when we say that this extra quality of Detroit Springs is the *only* quality you car owners can afford to buy. It is the only quality which car manufacturers dare choose for their machines.

Less than the extra quality of Detroit Springs is a compromise with discomfort, a compromise with the needless wear of expensive mechanism through jolt and jar, a compromise with the positive danger to life and limb from broken springs.

The Life of the Car—Its Comfort—Safety—Service—Depend on the Springs. So *specify Detroit Springs*—demand them on your car for their extra safety, comfort and long service.

Naturally, springs made to the D. S. P. Standards cost the automobile maker more. But the insurance against accidents alone is worth it. An additional income is the saving in repairs to car and tires. No conscientious manufacturer ignores such powerful aids to the prestige of his car and the satisfaction of his customer.

Consider the increased comfort. You must realize that both tires and upholstery are stripped of a large measure of their value unless assisted by resiliency such as Detroit Springs afford.

THIS man is testing Detroit Springs for hardness. Every individual leaf of the Detroit Spring on your car has passed this test successfully. Two other crucial trials of entirely different characters are required before the springs are entitled to their position as guardians of your safety—factors for your comfort and the long life of your car. Write for the booklet that explains these tests and the interesting processes that lead up to them.

Get the Springs Guaranteed for Two Years. Our positive two-year guarantee to the car maker covers the replacement of every Detroit Spring, either broken or settled, delivered to us f. o. b. Detroit. This guarantee protects you against defective material or workmanship for two years from the date of manufacture stamped on the short leaf of each spring.

We are safe in so doing. Our tests assure us that the Detroit Springs you get will outlast the guarantee. Before they leave the factory they have passed through strains that your car never can equal. The "Initial Test," the "Hardness Test," the "Capacity Test," condense years of shock and stress into a few days.

Forty-eight processes have preceded these tests. Every process is managed deliberately, scientifically, by the masters of spring making we employ. That's why Detroit Springs pass our factory tests and the car owners' road tests with strength, elasticity and endurance to spare.

Silent, permanently resilient, self-lubricating. The new feature of Detroit Springs, the Self-Lubricating Device—patents pending—ends the dark ages of squeaking, noisy springs. Distributing cavities at end of each leaf are filled with long-lived lubricant. This lubricant feeds with every movement of the spring leaves. They slide upon each other, easily, silently.

Write for Free Booklet —the story of the entire process of manufacturing these *extra quality* springs and the tests that prove them.

DEALERS: Your Detroit Electric Sales Are Not Limited

80% of all electric car owners belong to the well-to-do "middle class" of American families. They drive no other car. Their electric is the family car in constant use from early morning till late at night—winter and summer.

The popularity of the electric is gaining ground daily and **sales possibilities are unlimited.**

Detroit Electric Agency Openings Becoming Scarce

Now—not next year—is the time to get into the electric automobile business right. We have a few cities open. They will not be open long. We want the best dealers in these cities. As a class Detroit Electric dealers represent the most substantial men in their respective communities. This type of men we want in **every** city. Only **permanent** representation is desired. We are in position to furnish such dealers sales helps of an unusual character, drawn from years of experience in every part of the country.

Large Volume Lowers Prices

For 1913 Detroit Electric dealers sold **double** the aggregate number of pleasure vehicles that the dealers of any other manufacturer sold. Our plans for 1914 are on a still larger scale. Our large volume enables us to make **better** cars than ever and to sell them at **less** money than ever. A small volume would make it necessary—with the improvements we have added for 1914—to list our cars at from $350 to $400 more than our 1914 prices.

Keep in mind the fact that we build the finest electric cars made and then compare the following prices with those asked elsewhere:—

1914 Detroit Electric Prices:

With Bevel Gear Axle		*With Worm Gear Axle*	
Victoria	$2300	Gentlemans' Roadster	$2500
4-pass. Brougham Rear Seat Drive	2550	4-pass Brougham Rear Seat Drive	2850
5-pass. Brougham Front Seat Drive	2800	5-pass. Brougham Detroit Duplex Drive	3000

(Prices f. o. b. Detroit)

If our policy of doing business appeals to you as being right, and offering the greatest possibilities for the future, we should be glad to hear from you. Gas car dealers or electric car dealers handling other lines are invited to get in touch with us.

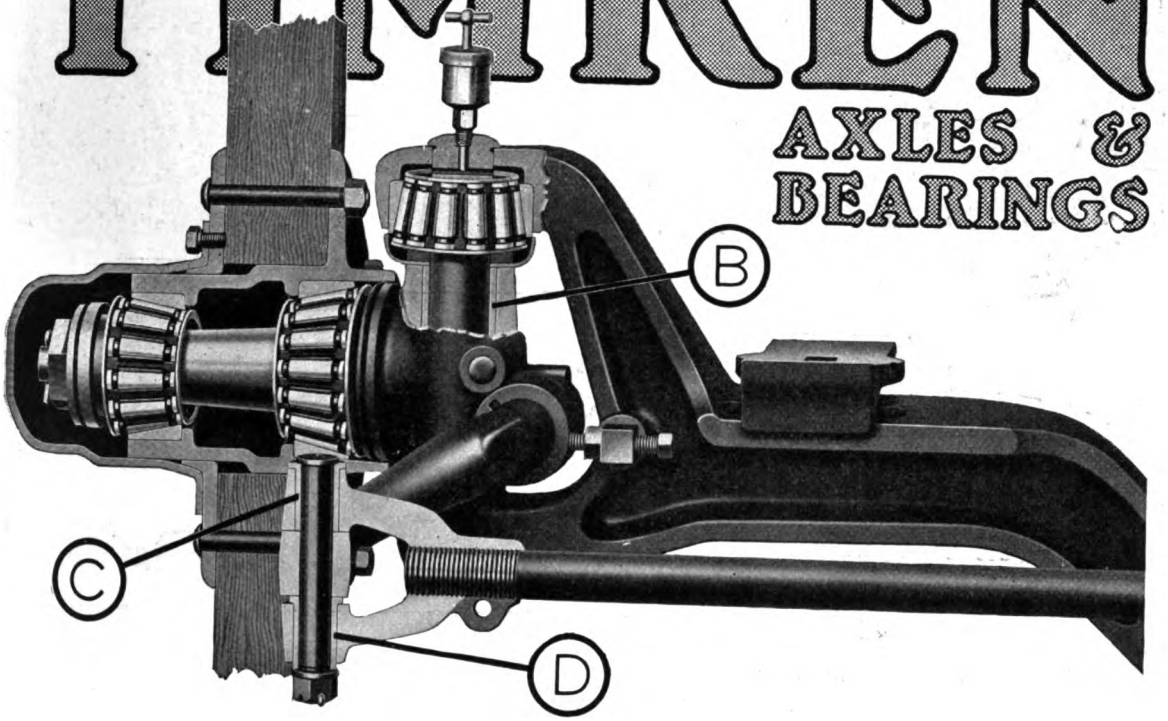
THE ATTERBURY LINE

HOW are you going to know what size truck is best adapted to the needs of the business houses in your territory? Even if you are shrewd enough to size up the situation and pick out a truck which more nearly fits the majority of business requirements, isn't there a lot of business you will have to pass up because of your inability to furnish a truck of the proper size to give the most economical results? We are putting this matter to you for your judgment to decide.

Do you want to handle a certain line of heavy-duty trucks and a different line of medium or light-duty trucks? Can you do justice to either line and, more important, can you do justice to your customers when you boost a certain type truck for one class of hauling and a different type of truck for another class of hauling? Do you think the Average American business man is not keen enough to see the fallacy of such a policy? And do you think your arguments will bear sufficient weight to sell a truck, when for one set of conditions you are forced to advocate one kind of construction, hitch-up, motor or rear-end and for another set of conditions you are forced to advocate an entirely different hitch-up? Can you not see the value of selling a complete line which comprises all sizes from 1,500 pounds to five tons?



There is no complete line of trucks manufactured in America today that can compare favorably with the Atterbury line, motor for motor, chassis for chassis, rear-end construction for rear-end, etc.

Get in touch with us before deciding, let us send you our dealers' proposition and all information about the Atterbury Line before you decide.

The Atterbury Motor Car Company, Buffalo, New York

TIMKEN
AXLES & BEARINGS

Axles That Never Wear Out

MOVING parts of axles, like moving parts of anything, will wear in time. There is no exception to this rule, but—

In the Timken-Detroit Front Axle the moving parts—every one of them—are either Timken Roller Bearings or hardened and ground steel bushings or pins.

These bearings, bushings and pins wear very slowly. Timken Bearings are adjustable to take up the slight wear and Timken-Detroit Bushings and Pins are easily replaceable when worn sufficiently

So the axle may truly be said to never wear out.

Take the front axle spindle. No wear comes on it because nothing moves on jt. Slight wear does come on the cones, cups and rollers of the two bearings. These are Timken Tapered Roller Bearings that offer greatest resistance to wear and are adjustable to offset the effects of wear when it comes.

Same thing is true of the steering knuckle pin. At the top, to sustain the great weight, is a Timken Bearing. Below, where pressure is less but where there is some motion, there's a hardened steel bushing. It is made of good steel, is heat-treated, hardened and ground to size so it wears very slowly.

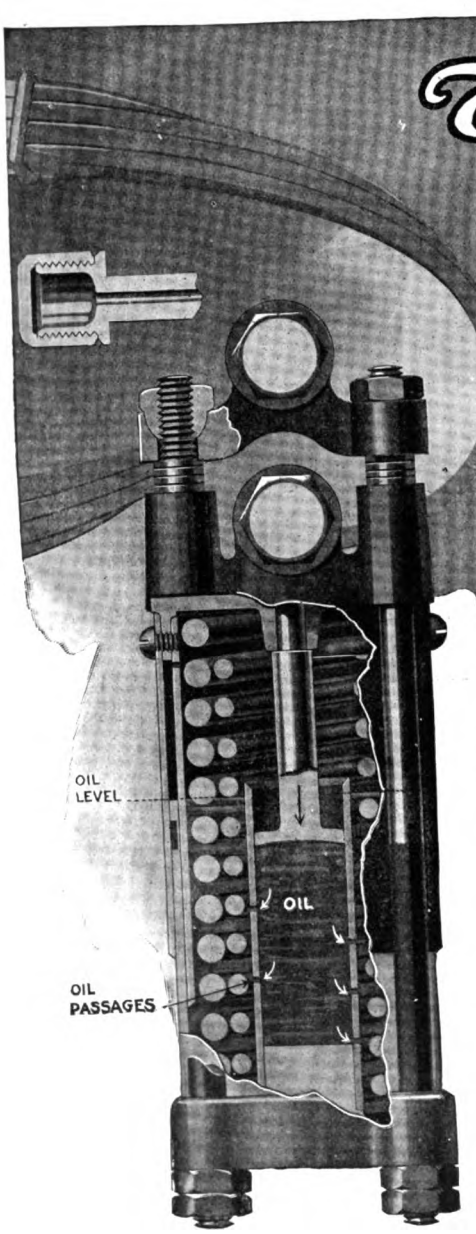
And when it does wear can be replaced easily, quickly and cheaply. Because Timken Bushings are accurate to the thousandth part of an inch, they are interchangeable. A new one will fit without any tinkering.

Look at the bushing "B" in the picture. The pin is keyed into the steering knuckle in which this bushing is pressed. There's no turning of the pin in bushing "B." Then why have a bushing at all?

To make a tight fit so there'll be no pound from the constant vibration. Not one little point like this is overlooked in Timken-Detroit design.

Note the bushings in the cross-rod yoke (C and D). Due to spread of yoke the pressure is kept low and when wear comes here it must come on hardened pin and bushings that are replaceable at low cost. They, too, are accurate and interchangeable.

Of course Timken-Detroit Axles are strong enough, and to spare, for the loads they are designed to carry. And for the emergencies of motor-truck and pleasure car service. They are standing up under thousands of commercial and pleasure cars made by the leading builders.



When every other part of those cars is worn out, new pins, new bushings, perhaps a new bearing here and there will fit them for another lifetime of service under another car.

A 52-page booklet, "The Anatomy of Automobile Axles," sent free, postpaid on request, tells the story of the axle in an interesting human way. Write for it.

Regal

Rushmore Electric Lighter and Starter

Left Hand Drive—Center Control

Model "T"—5 Passenger Underslung Touring Car—$1125

Scientific Care of Every Detail— Secret of *Regal Quality*

THE New Series of Regal Cars has increased our reputation as builders of automobiles of quality. This fact is now recognized by dealers and consumers the world over.

And the secret of Regal Quality is—*scientific and conscientious care in the construction of every single detail.* Thus, perfect details result in pefect Regal Cars—automobiles of utmost efficiency, long-life, power, beauty and economy.

The new Regal Cars are *finished products*—complete in every detail of mechanical construction and body beauty. They actually *look like* cars costing $2000 or more because of their refinement features and external appearance.

Every desirable advancement is found in these new cars. No more motor car value can be purchased anywhere this year for such prices.

Values Offered You—

We have incorporated the efficient and positive Rushmore Electric Starter and Lighter as standard equipment on all Regal Cars. The desired left hand drive and center control have been adopted. Other features of our standard equipment are: Electric headlights, with dimming attachment. Long, low, sweeping body lines with cowl dash. Starter, lighting and speedometer switches on instrument board. Special adjustable curtains. Rain vision and ventilating windshield. Demountable rims. Tire irons. Foot throttle and muffler cut out.

The New Series—

Jeffery-Dewitt SPARK-PLUGS in the Making

Scene V. Screw Machine Department. A battery of 4-spindle automatics is shown working upon four bars of stock at one time turning out bushings and shells.

THIS 75-CENT PLUG ESPECIALLY
IS THE SALVATION OF ALL OILY MOTORS

Petticoat Plug, with closed end and central electrode of special alloy.

It is the ***J-D*** Petticoat with closed end of improved design, which not only adds stability to the entire plug, but **makes it especially desirable and serviceable where an excess of oil is used.**

Besides, the porcelain is made in the Jeffery-Dewitt potteries of imported clays blended by a secret process. It will withstand any voltage.

FOR FORD CARS

this plug is almost a necessity, guaranteed not to foul or crack. It gets all the good out of the motor. Send for our free handbook of ignition, which also describes the whole ***J-D*** line—a plug for every type of motor.

JEFFERY-DEWITT CO.,

"AS SURE AS THE WHIRL OF THE WORLD"

WOMEN WON'T WORRY

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

Women won't worry if their cars are equipped with Auto-Lite starting motors and lighting generators. They are an open-sesame which removes the last obstacles from the pleasant and successful operation of gasoline motor cars by women—eliminating muscular effort and placing completely within their control the most powerful machines.

The Auto-Lite Starting Motor will turn an average engine faster than 100 revolutions per minute; compelling positive starting.

The Auto-Lite Generator, automatically, furnishes an abundance of electric current—enough to charge the storage battery and keep the lamps burning brilliantly.

Every Owner Should Have This Book

"Handbook on Care and Operation of Modern Electric Systems" so full of interesting information on all modern electric systems that no automobile owner can afford to be without it Explains, in detail, functions of the various parts—how to locate and remedy troubles of all kinds—embraces all electrical automobile systems. The large operation chart which it contains is alone worth the price. Regular price, 50c. Will be sent to you for 10c. in stamps if you use this coupon.

"The Pioneer Makers of the 6-volt Electric System"

THIS COUPON SAVES YOU 40c.

The Electric Auto-Lite Co.
116 Michigan St., Toledo, Ohio

Enclosed find 10c. in stamps for which please send me your handbook.

"Two Years Ahead"—

This is the opinion of a prominent official of the Ford Motor Company after he had examined carefully the Kelly water-cooled models.

As a result, the Ford Company purchased two three-ton Kellys—making a total of four Kellys now in use at the Detroit plant. These purchases were made after carefully looking over every truck of national repute.

The Dayton Engineering Laboratories Company (Delco) just bought a three-ton Kelly for its Dayton factory.

These companies know the best truck when they see it. Do you?

DEALERS!
There is still some desirable Kelly territory open. Write for our agency proposition.

FISK Tubes

FEW DEALERS need to be told anything about the quality of Fisk Tubes. They are famous in the trade as **the pure gum tubes** that can be carried in stock for a long time with no sign of deterioration.

They are pure Para rubber, vulcanized ***right*** and spliced ***right.*** There you have the whole secret as to why the same tube is often used year after year in practically continuous service.

No argument is needed to prove the superiority of a pure gum tube over a compounded one. Why not sell Fisk Tubes and give your customers the benefit of your knowledge and experience?

Inefficiencies of bolted-up parts may be due to looseness of fit, frictional wear, movement of bolt or nut, or elongation of bolt.

ALL THESE INEFFICIENCIES CAN BE OVERCOME BY A PROPERLY DESIGNED SPRING WASHER. The Hunt Test, full details of which were given in our advertisement of May first in this publication, proved conclusivoly and finally that a properly designed spring lock washer will prevent elongation of bolt, prevent nut movement and compensate for frictional wear.

The prevention of frictional wear depends entirely upon the SPRING POWER of the lock washer.

Considering these facts—and they ARE facts—you will be quick to see that the purchase of the RIGHT SPRING LOCK WASHER involves far more of discrimination than is usually practised.

And that the securing of nut lock washers of proper section, proper analysis and proper heat treatment is a matter of extraordinary importance.

After reaching this inevitable conclusion, you will naturally be interested in the nut lock washers, the tests of which have furnished the only positively scientific data available.

The lighting facilities of this car are strikingly original

CONCEALED under a cornice shading the mahogany instrument board of all KisselKar models is a row of miniature electric lights which at night completely illuminate not only the meters, switches and other instruments, but also the floor of the front compartment. This is a late KisselKar innovation that will be fully appreciated.

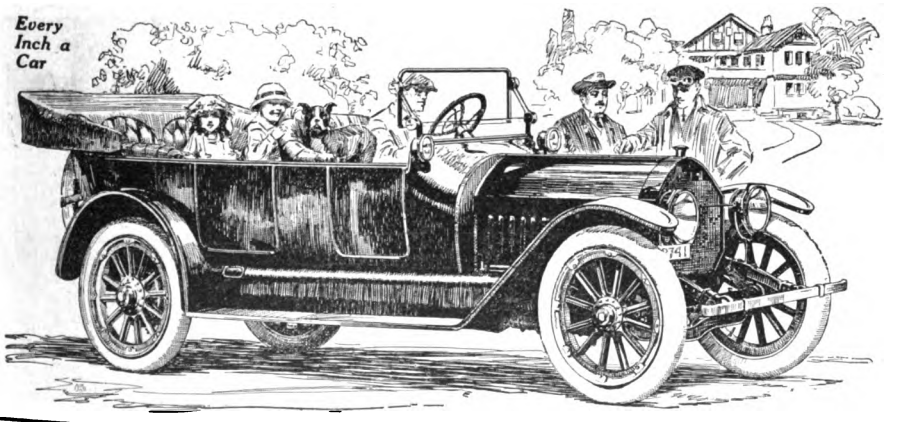
And the idea of convenient illumination is carried still further—a rear "bull's-eye" in the side lamps sweeps the running boards, and a similar device in the tail lamp shines directly on the gasoline gauge.

KISSELKAR

The KisselKar has a powerful, easily accessible, long stroke motor capable of developing plenty of excess power. It is silent, smooth running, flexible and responsive to every demand. There is no better motor under the hood of any automobile at any price.

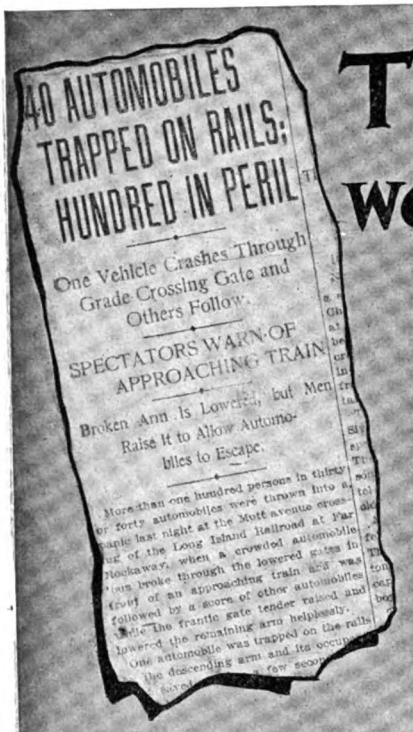
KisselKar comfort is built into the car, not added onto it. It is due to the extra liberal wheelbase, big wheels and tires, big resilient springs, roomy tonneau and extra deep seats. In the things that "count" the KisselKar is always "there."

There are three sizes—the 60 H. P. "Six" at $3150, the 48 H. P. "Six" at $2350 and the 40 H. P. "Four" at $1850. All KisselKars are fully equipped, electric lighted and started; left hand drive, center control.



Illustrated Catalog on Request

KisselKar Service Contract—KisselKar Service offers owners an exceptionally efficient system of permanent cooperation that forestalls trouble and keeps the car always "up to the mark." The exact scope of this service is stipulated in the written KisselKar Service Contract.



KISSELKAR TRUCKS—Six sizes, 1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Ask for Truck Catalog

40 AUTOMOBILES TRAPPED ON RAILS; HUNDRED IN PERIL

One Vehicle Crashes Through Grade Crossing Gate and Others Follow.

SPECTATORS WARN OF APPROACHING TRAIN

Broken Arm Is Lowered, but Men Raise It to Allow Automobiles to Escape.

More than one hundred persons in thirty or forty automobiles were thrown into a panic last night at the Mott avenue crossing of the Long Island Railroad at Far Rockaway, when a crowded automobile ran broke through the lowered gates in front of an approaching train and was followed by a score of other automobiles. While the frantic gate tender raised and lowered the remaining arm helplessly. One automobile was trapped on the rails, the descending arm and its occupants [illegible]

These Brakes were Insufficient

SHELDON

MEANS CERTAINTY

Pages and pages have been written about the safety of this or the necessity of that accessory or equipment on a motor vehicle but in the last analysis the entire efficiency of that vehicle depends upon ITS BRAKES.

The safety of the truck, the operator, and the public is no more certain than the strength of those brakes. Over treacherous grade crossings—down winding hills—through congested city traffic—what does a driver depend upon to a greater extent than the brakes? Yet it seems that the average buyer pays very little attention to this vital factor in a motor vehicle.

You should know that SHELDON BRAKES offer the utmost protection that it is possible to obtain.

You should know that SHELDON BRAKES are as nearly infallible as hand, brain and machinery can make them. The most dangerous courses anywhere have no terrors for a SHELDON-EQUIPPED car.

Every SHELDON BRAKE bears the mark of perfection before it leaves our factory.

Primarily its design is the most efficient in the world. SHELDON 3-ton brakes will skid the wheels with a 4½-ton load on a 30% grade. Its thoroughness in the matter of materials and construction is so sufficiently well known to engineers that to most of them "SHELDON" is synonymous with "SAFETY."

You can do no better than to specify SHELDON DOUBLE BRAKE REAR WHEEL EQUIPMENT.

Then you'll be certain that YOUR TRUCK IS SAFE—ANYWHERE—EVERYWHERE—ALWAYS.

The SHELDON Brake Equipment *is Supreme*

Model "SS"
Buda "Little Six"

More Buyers Every Day Insist on BUDA MOTOR

"THE PART THAT SELLS THE CAR"

Modern complexity has brought into being the *Specialist.* Each "thing" we make is really a combination of many things, each of which may be a life work.

An Author writes a "book"—really a bundle of manuscript. He's a *Specialist* in ideas—like an *automobile designer*

He turns the "book" over to a "Publisher" (who is a *Specialist* in the business end of book making.)

Can a Publisher "publish" a book by himself? Not without the aid of the Binder, a *specialist.* And neither can the printer print nor the binder bind without the Ink *Specialist,* the Paper *Specialist,* the Glue *Specialist* and all the others, *each doing ONE THING WELL.*

Can a car manufacturer manufacture a car? **NO.** Never could, cannot now, never will. And the tendency of the public is to realize this more and more, and (for the sake of ECONOMY and QUALITY) to insist on the BUDA MOTOR, made by a Successful Specialist. Always look under the hood. It's a good habit.
